Bracts of the inflorescence large, persistent, firm, and leaflike.

Leaves 1.5 to 5 cm. long.....4. *S. nelsonii*.

Leaves mostly 7 to 15 cm. long.

Leaves tomentose beneath.....5. *S. shannonii*.

Leaves glabrous beneath except along the costa.....6. *S. collinsii*.

Bracts small, never leaflike, usually deciduous.

B. Leaves oblong or lanceolate or, if ovate, not cordate at base.

Calyx densely lanate.

Leaves crenulate.....7. *S. confinis*.

Leaves coarsely dentate.....8. *S. californica*.

Calyx canescent, pubescent, or tomentose, not lanate.

C. Leaves entire or essentially so.

Leaves sessile or subsessile, narrowly oblong or linear, strongly revolute.

Leaves linear, glabrous above; calyx glabrate...9. *S. fasciculata*.

Leaves narrowly oblong, tomentulose above; calyx glandular-pilose.....10. *S. coulteri*.

Leaves, except sometimes the uppermost, petiolate.

Leaves usually narrowly triangular-ovate, truncate at base.

11. *S. candicans*.

Leaves narrowly ovate or oblong, attenuate or rounded at base.

Calyx lobes obtuse.

Calyx glandular-pubescent.....12. *S. thymoides*.

Calyx without glandular pubescence...13. *S. chionophylla*.

Calyx lobes acuminate.

Leaves ovate or ovate-oblong, 3 to 7 mm. long, all slender-petiolate-----14. *S. serpyllifolia*.

Leaves oblong, 10 to 25 mm. long, the uppermost sessile.

Leaves finely stellate-pubescent, at least when young.

15. *S. coahuilensis*.

Leaves glabrous-----16. *S. lycioides*.

CC. Leaves crenate or crenate-serrate.

Calyx lobes becoming much broadened in age, the calyx funnelform.

Leaves green above, usually rugose, regularly crenate.

Calyx finely and closely tomentose-----17. *S. ballotaeflora*.

Calyx loosely and coarsely stellate-tomentose.

18. *S. ramosa*.

Leaves very pale on both surfaces, irregularly crenate.

19. *S. platycheila*.

Calyx lobes not broadened in age or scarcely so.

Mature leaves glabrous-----20. *S. similis*.

Mature leaves pubescent on one or both surfaces.

Pubescence of the leaves of stellate hairs.

Stems very densely and finely white-tomentulose; verticels

6 to 10-flowered-----21. *S. cedrosensis*.

Stems thinly stellate-tomentose; verticels 2 to 6-flowered.

22. *S. chamaedryoides*.

Pubescence of the leaves not stellate.

Leaves obtuse, densely viscid-pubescent on the upper surface.

23. *S. purpusii*.

Leaves acuminate, glabrous or nearly so on the upper surface.

Upper leaves sessile; flowers cymose-paniculate.

24. *S. dasycalyx*.

Upper leaves long-petiolate; inflorescence racemose.

25. *S. fallax*.

BB. Leaves ovate or broadly ovate, usually cordate at base.

Leaves glabrous beneath or sparsely puberulent along the nerves.

4. *S. nelsonii*.

Leaves, at least when young, densely pubescent or tomentose beneath.

D. Leaves stellate-pubescent beneath, at least when young.

Calyx densely white-lanate-----26. *S. rubropunctata*.

Calyx stellate-tomentose, not lanate except sometimes at base.

Leaves 1 to 1.5 cm. long-----27. *S. fruticososa*.

Leaves 2 to 6 cm. long.

Branchlets and nerves of young leaves with sulphur-yellow tomentum-----28. *S. conzattii*.

Branchlets and lower surface of leaves with white tomentum.

Leaves broadly ovate, sharply crenate-dentate; calyx lobes obtuse-----29. *S. pruinosa*.

Leaves oblong-ovate, obtusely crenate; calyx lobes acute.

30. *S. goldmanii*.

DD. Leaves white-tomentose beneath with simple hairs.

E. Leaves very rugose above, usually broadly ovate, obtuse.

Pedicels very short, 3 mm. long or less; racemes rather dense; calyx in anthesis 4 to 5 mm. long.

Calyx glandular-villous-----31. *S. scordoniaefolia*.

- Calyx without glandular pubescence.
 Pubescence of the corolla glandular.....32. *S. dugesii*.
 Pubescence of the corolla chiefly eglandular.
 33. *S. lasiantha*.
 Pedicels 3 to 9 mm. long; racemes loosely flowered; calyx in
 anthesis 6 mm. long or more.
 Calyx purplish violet, glandular-villous, in anthesis nearly 19
 mm. long.....34. *S. semiatrata*.
 Calyx green or blue-tinged, glandular-puberulent and minutely
 hispidulous on the nerves, in anthesis about 6 mm. long.
 Leaves oblong or narrowly ovate.....35. *S. rupicola*.
 Leaves broadly ovate.....36. *S. gonzalezii*.
 EE. Leaves only slightly rugose, narrow-ovate, mostly acuminate.
 Flowers in small cymes, these arranged in a terminal thyrse.
 37. *S. thyrsoflora*.
 Flowers in simple or branched racemes.
 Branches pubescent with soft ascending hairs.
 38. *S. multiramea*.
 Branches short-pilose with recurved-spreading hairs.
 Calyx tubular, in fruit 5 mm. long, the tube 4 times as
 long as the lobes.....39. *S. alamosana*.
 Calyx campanulate, in fruit 6 to 7 mm. long, the tube twice
 as long as the lobes.....40. *S. chapalensis*.
 AA. Corolla 2 to 12 cm. long, variously colored, often scarlet or yellow.
 Corolla yellow.
 Flowers axillary, solitary.....41. *S. aspera*.
 Flowers racemose.....42. *S. chrysantha*.
 Corolla not yellow.
 Calyx inflated-campanulate. Corolla scarlet.
 Stems viscid-hirsute.....43. *S. adglutinans*.
 Stems not viscid-hirsute.
 Leaves chiefly ovate-lanceolate to oblong, cuneate or narrowed at
 base.....44. *S. sessei*.
 Leaves broadly ovate to orbicular.
 Leaves pubescent beneath on the nerves, 4 cm. long or less;
 branches glabrate.....45. *S. regla*.
 Leaves tomentose beneath, usually more than 4 cm. long;
 branches tomentose or puberulent.
 Branches tomentose.....46. *S. pubescens*.
 Branches puberulent.....47. *S. muralis*.
 Calyx tubular-campanulate, not inflated.
 F. Corolla ventricose, the tube straight.
 G. Leaves 1 to 4 cm. long.
 Flowers axillary.....48. *S. disjuncta*.
 Flowers in terminal racemes.
 Leaves narrowly oblong to linear-oblong.....49. *S. greggii*.
 Leaves ovate or broadly oblong.
 Pubescence of branches and leaves stellate...50. *S. oaxacana*.
 Pubescence of branches and leaves simple.
 Calyx glabrous, or barely puberulent at base...51. *S. oresbia*.
 Calyx hispidulous on the nerves.
 Leaves glabrous or glabrate beneath...52. *S. grahami*.

Leaves pubescent beneath.

Leaves mostly less than 2 cm. long—53. *S. microphylla*.

Leaves usually more than 2 cm. long.

Corolla 3.2 to 3.5 cm. long-----54. *S. schaffneri*.

Corolla 2.5 to 2.7 cm long.

Leaves thin, hardly rugose, subacuminate.

55. *S. lemmoni*.

Leaves rugose, usually rounded at apex.

56. *S. neurepia*.

GG. Leaves larger, all except the smallest more than 4 cm. long.

Leaves glabrous beneath or nearly so

Calyx herbaceous, the tube becoming corrugated, the lobes subequal-----57. *S. pringlei*.

Calyx less herbaceous, the tube not corrugated, the lobes unequal.

Leaves cuneate or obtuse at base-----58. *S. involucrata*.

Leaves mostly cordate at base-----59. *S. pulchella*.

Leaves pubescent beneath.

Corolla 2.5 to 2.7 cm. long-----60. *S. adenophora*.

Corolla 4 to 6 cm. long

Leaves densely white-tomentose beneath, finely crenate-serate; calyx glandular-puberulent-----61. *S. fulgens*.

Leaves pilose beneath on the nerves, coarsely crenate; calyx not at all or very minutely glandular-puberulent.

62. *S. orizabensis*.

FF. Corolla not ventricose, the tube straight or curved.

Leaves cuneate or narrowed at base.

Leaves pubescent beneath; corolla rose-purple.

Corolla 1.5 to 1.8 cm. long.

Leaves ovate or oblong-ovate-----63. *S. chiapensis*.

Leaves oblong-lanceolate-----64. *S. antennifera*.

Corolla 2.5 to 4 cm. long-----65. *S. curviflora*.

Leaves glabrous beneath; corolla red-----66. *S. miniata*.

Leaves rounded or cordate at base.

Leaves cordate at base.

Corolla purple or pink-----67. *S. aristulata*.

Corolla scarlet.

Calyx in anthesis 1 cm. long-----68. *S. cyclophylla*.

Calyx 1.7 to 2 cm. long-----69. *S. incana*.

Leaves rounded or rounded-truncate at base, not definitely cordate.

Leaves lanceolate, 10 to 15 cm. long-----70. *S. perlonga*.

Leaves ovate or ovate-lanceolate, shorter.

G. Corolla purple or flesh-colored.

H. Leaves glabrous or minutely puberulent beneath.

Branches canescent-velutinous; flower clusters 2-flowered-----71. *S. graciliflora*.

Branches slightly pilose, puberulent, or glabrous; flower clusters several or many-flowered.

Glands (2) usually present at base of petiole; corolla 2 to 2.7 cm. long-----72. *S. purpurea*.

Glands absent; corolla 2.5 to 4 cm. long--73. *S. littae*.

HH. Leaves more or less pilose or tomentose beneath.

Pubescent stellate.

Calyx 12 to 13 mm. long-----74. *S. rosei*.

Calyx 5 mm. long-----75. *S. arbuscula*.

Pubescence not stellate.

Leaves merely pilose beneath.

Leaves broadly ovate; corolla deep purple-violet.

76. *S. iodantha*.

Leaves ovate-lanceolate; corolla flesh-colored.

77. *S. michoacana*.

Leaves velutinous or lanate beneath.

Leaves serrate; calyx lobes broad, mucronate.

78. *S. nervata*.

Leaves crenate; calyx lobes long-acuminate.

79. *S. karwinskii*.

GG. Corolla scarlet or vermilion.

Calyx lips unequal, the upper one produced into a subulate awn, the lower one short-----80. *S. cinnabarina*.

Calyx lips subequal.

Calyx lobes subulate-tipped-----81. *S. elegans*.

Calyx lobes not subulate-tipped.

Bracts 2 to 3 cm. long, persistent----82. *S. mollissima*.

Bracts smaller, deciduous-----83. *S. coccinea*.

1. *Salvia leucantha* Cav. Icon. Pl. 1: 16. *pl. 24*. 1791.

Salvia bicolor Sessé & Moc. Pl. Nov. Hisp. 8. 1887.

Zacatecas to Puebla and Morelos.

Plants chiefly herbaceous, sometimes suffrutescent below; leaves short-petiolate, 5 to 17 cm. long, attenuate, crenulate, green above, tomentose beneath; flowers in long racemes; calyx nearly 1 cm. long, covered with beautiful purple wool; corolla about 18 mm. long.

2. *Salvia lantanaefolia* Mart. & Gal. Bull. Acad. Brux. 11²: 69. 1844.

Puebla; type from Tehuacán.

Shrub; leaves obtuse, green above, tomentose beneath; flowers in dense racemes; calyx about 1 cm. long.

3. *Salvia populifolia* Fernald, Proc. Amer. Acad. 35: 530. 1900.

Type from Bolaños, Jalisco.

Shrub; leaves acute, crenulate, green and glabrate above, whitish-tomentose beneath; calyx in anthesis about 18 mm. long, the lobes acuminate; corolla 3.5 cm. long.

4. *Salvia nelsonii* Fernald, Proc. Amer. Acad. 35: 527. 1900.

Salvia albicans Fernald, Proc. Amer. Acad. 36: 501. 1901.

Guerrero, Puebla, and Morelos; type collected between Acatlán and Piaxtla, Puebla.

Shrub, 2.5 to 5 meters high, the branches cinereous-puberulent; leaves ovate, acute or acuminate, rounded at base, serrulate, finely canescent-puberulent; flowers in dense spikelike racemes; calyx 8 mm. long, densely white-tomentose, the lobes obtuse; corolla about 14 mm. long, blue and white.

5. *Salvia shannoni* Donn. Smith, Bot. Gaz. 19: 256. 1894.

Oaxaca and Chiapas. Guatemala; type from Volcán Chingo.

Shrub; leaves lanceolate to ovate, obtuse or cordate at base, acuminate, serrate or crenate-serrate, green above; racemes very thick and dense, the bracts purplish; calyx about 1 cm. long, the lobes acute.

6. *Salvia collinsii* Donn. Smith, Bot. Gaz. 61: 386. 1916.

Type from Pantepec, Chiapas.

Shrub, 1 to 1.5 meters high; leaves lance-oblong, long-acuminate, obtuse or acute at base, serrate, green and glabrous above, pale beneath; calyx 7 to 8 mm. long, green, the lobes acute; corolla white.

7. *Salvia confinis* Fernald, Proc. Amer. Acad. 35: 523. 1900.

Sonora. Type from Fort Huachuca, Arizona.

Branches stellate-canescens; leaves oblong, 1.5 to 4.5 cm. long, obtuse or acutish, canescens; racemes spikelike, 1 to 4 cm. long; corolla blue, scarcely 1 cm. long.

8. *Salvia californica* T. S. Brandeg. Proc. Calif. Acad. II. 2: 197. 1889.

Baja California; type from Calmalli.

Shrub, 1 meter high or less, densely stellate-tomentose; leaves sessile, ovate-elliptic, 18 mm. long or less, with few coarse spreading teeth; racemes interrupted, spikelike; corolla blue.

9. *Salvia fasciculata* Fernald, Proc. Amer. Acad. 45: 54. 1904.

Type from mountains near Oaxaca.

Shrub; leaves 1 to 2.5 cm. long, canescens beneath, strongly revolute; racemes 1 to 3 cm. long; calyx tubular-campanulate, in anthesis 4 mm. long, minutely stellate-pubescent; corolla purplish, 8 mm. long.

10. *Salvia coulteri* Fernald, Proc. Amer. Acad. 35: 519. 1900.

Type from somewhere in Mexico.

Leaves 1 to 1.5 cm. long, stellate-tomentulose, obtuse, revolute; racemes 2 to 3 cm. long; calyx 6 to 7 mm. long, the teeth lance-subulate; corolla 12 mm. long.

11. *Salvia candicans* Mart. & Gal. Bull. Acad. Brux. 11²: 61. 1844.

Puebla; type from Tehuacán.

Shrub, 2 meters high or less; leaves 1 to 3 cm. long, obtuse, coriaceous, very densely stellate-tomentose, at least beneath; racemes short, dense; calyx 5 to 8 mm. long, densely stellate-tomentose; corolla 8 to 13 mm. long.

12. *Salvia thymoides* Benth. Lab. Gen. & Sp. 255. 1834.

Puebla and Oaxaca; type from Mitla, Oaxaca.

Slender shrub, usually about 30 cm. high; leaves mostly 4 to 7 mm. long, obtuse, stellate-tomentulose or glabrate; racemes slender, elongate, interrupted; calyx 5 to 6 mm. long; corolla about 13 mm. long.

13. *Salvia chionophylla* Fernald, Proc. Amer. Acad. 43: 64. 1907.

Type from Chojo Grande, 27 miles southeast of Saltillo, Coahuila.

Stems fruticose, decumbent, stellate-canescens; leaves 5 to 15 mm. long, rounded at apex, minutely stellate-tomentulose, whitish; racemes 5 to 10 mm. long, interrupted; calyx 6 to 9 mm. long; corolla 1.5 cm. long, blue and white.

14. *Salvia serpyllifolia* Fernald, Proc. Amer. Acad. 35: 521. 1900.

Type from San Luis Potosí.

Stems short-pubescent with white, spreading or recurved hairs; racemes 10 to 20 cm. long, interrupted; calyx short-hispidulous; corolla 12 mm. long.

15. *Salvia coahuilensis* Fernald, Proc. Amer. Acad. 35: 520. 1900.

Coahuila; type from Saltillo.

Plants 70 cm. high or less, woody below, the stems stellate-puberulent or glabrate; racemes 5 to 35 cm. long, interrupted; calyx puberulent, 6 to 8 mm. long; corolla 1.5 cm. long, blue.

16. *Salvia lycioides* A. Gray, Proc. Amer. Acad. 21: 408. 1886.

Santa Eulalia Mountains of Chihuahua.

Slender shrub, the branches sparsely puberulent or glabrate; leaves mostly obtuse; racemes slender, elongate, interrupted; calyx 6 to 8 mm. long; corolla nearly 2 cm. long.

17. *Salvia ballotaeiflora* Benth. Lab. Gen. & Sp. 270. 1834.

Salvia laxa Benth. Lab. Gen. & Sp. 270. 1834.

Salvia ballotaeiflora eulaliae Fernald, Proc. Amer. Acad. 35: 522. 1900.

Chihuahua to Zacatecas, Hidalgo, and Tamaulipas; type from Tolimán (Querétaro?). Western Texas.

Low shrub; leaves broadly deltoid-ovate, 1 to 3 cm. long, obtuse, densely stellate-tomentose beneath, usually truncate at base but rarely subcordate; racemes short, few-flowered; calyx 5 to 9 mm. long, the lobes very obtuse; corolla about 12 mm. long. "Engorda-cabra" (Zacatecas); "crespa" (San Luis Potosí); "mejorana" (Texas, Chihuahua); "mejorana del país" (Chihuahua).

S. ballotaeiflora eulaliae is a form with large leaves (3 cm. long).

18. *Salvia ramosa* T. S. Brandeg. Zoe 5: 255. 1908.

Type from Tlacuilotepec, Puebla.

Shrub; leaves 1 cm. long or less, obtuse or rounded at apex, very rugose, finely stellate-puberulent, green above; racemes elongate, interrupted; calyx 4 to 5 mm. long; corolla about 7 mm. long.

19. *Salvia platycheila* A. Gray, Proc. Amer. Acad. 8: 292. 1870.

Carmen Island, Baja California.

Shrub; leaves slender-petiolate, 2 to 4.5 cm. long, very obtuse, very minutely and densely tomentulose; racemes short or elongate, interrupted; calyx 8 to 12 mm. long, minutely tomentulose; corolla nearly 2 cm. long.

20. *Salvia similis* T. S. Brandeg. Zoe 5: 108. 1901.

Baja California; type from mountains of the Cape Region.

Much-branched shrub, 1 to 3 meters high, the stems minutely canescent-tomentulose; leaves ovate, 2.5 to 7.5 cm. long, coarsely crenate-serrate, minutely stellate-tomentulose when young but soon glabrous; racemes short, dense; calyx 5 to 7 mm. long; corolla pale blue.

21. *Salvia cedrosensis* Greene, Bull. Calif. Acad. 1: 212. 1885.

Baja California; type from Cedros Island.

Low shrub; leaves slender-petiolate, ovate or broadly ovate, 2.5 cm. long or less, obtuse or acute, crenate, sparsely stellate-pubescent in age; racemes short or elongate, interrupted; calyx 5 to 7 mm. long, violet.

22. *Salvia chamaedryoides* Cav. Icon. Pl. 2: 77. pl. 197. 1793.

Salvia chamaedrifolia Andrews, Bot. Rep. 6: pl. 416. 1805 (?).

Salvia chamaedrys Willd. Hort. Berol. 1: 29. pl. 29. 1816.

Salvia chamaedryoides isochroma Fernald, Proc. Amer. Acad. 35: 522. 1900. Zacatecas and San Luis Potosí to Mexico.

Low shrub, usually about 40 cm. high; leaves 1 to 3.5 cm. long, obtuse, finely crenate, canescent-tomentose, sometimes green above; racemes elongate, interrupted; calyx 7 to 12 mm. long, often tinged with violet; corolla about 12 mm. long.

23. *Salvia purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 187. 1911.

Type from Cerro del Zapatero, Coahuila.

Low shrub, the branches glandular-pubescent; leaves 1.5 to 3 cm. long, obtuse, coarsely crenate, the lower ones (oblong) sometimes cordate at base,

densely glandular-pubescent; racemes 3 to 6 cm. long; calyx about 1 cm. long; corolla 18 mm. long, violaceous.

24. *Salvia dasycalyx* Fernald, Proc. Amer. Acad. 45: 421. 1910.

Type from the Sierra Madre of Michoacán or Guerrero, altitude 1,800 meters.

Shrub, 1.5 meters high; leaves lance-oblong, 3.5 to 5 cm. long, villosulous beneath along the veins; panicles dense, many-flowered; calyx 3 mm. long, villous; corolla violet, 7 to 8 mm. long.

25. *Salvia fallax* Fernald, Proc. Amer. Acad. 45: 419. 1910.

Type from Tepic.

Shrub, the young branches villous; leaves ovate, 6 to 11 cm. long, sharply serrate, sparsely villous beneath; racemes 10 to 15 cm. long; calyx 5 to 6 mm. long, violaceous; corolla blue, 1 cm. long.

26. *Salvia rubropunctata* Robins. & Fern. Proc. Amer. Acad. 30: 121. 1894.

Type from Huehuerachi, Sonora.

Plants suffrutescent; leaves ovate or oblong-ovate, 4 cm. long or less, stellate-pubescent beneath or glabrate, red-punctate, finely crenate; racemes short and dense; calyx 5 mm. long; corolla blue, 12 mm. long.

27. *Salvia fruticulosa* Benth. Lab. Gen. & Sp. 721. 1834.

Type collected near the city of Oaxaca.

Low shrub, the stems white-tomentose; leaves ovate, obtuse, crenulate, white-tomentose beneath.

28. *Salvia conzattii* Fernald, Proc. Amer. Acad. 35: 526. 1900.

Type collected between El Parián and Etla, Oaxaca, altitude 370 meters.

Leaves 1.5 to 6 cm. long, rounded at apex, very rugose above, finely crenulate; racemes spikelike, 2 to 6 cm. long; calyx densely blue-tomentose; corolla blue, 12 mm. long.

29. *Salvia pruinosa* Fernald, Proc. Amer. Acad. 35: 526. 1900.

Type collected between Mesquitec and Monte Escobedo, Jalisco.

Shrub, the branchlets stellate-tomentulose; leaves 2.5 to 5 cm. long, obtuse, crenate-dentate, green and rugose above, white-tomentulose beneath; racemes dense, 10 cm. long or less; calyx 4 to 5 mm. long; corolla blue, 12 mm. long.

30. *Salvia goldmanii* Fernald, Proc. Amer. Acad. 35: 527. 1900.

Type from Batopilas, Chihuahua.

Stems thinly stellate-tomentulose; leaves 5 to 10 cm long, acute, green above, pale beneath; racemes 5 to 15 cm. long; calyx 5 to 6 mm. long, bluish; corolla 1.5 cm. long.

31. *Salvia scorodoniaefolia* Poir. Encycl. Suppl. 5: 46. 1817.

Salvia melissodora Lag. Gen. & Sp. Nov. 2. 1817.

Salvia scorodonia Benth. Lab. Gen. & Sp. 264. 1834.

Salvia scorodoniaefolia crenaea Fernald, Proc. Amer. Acad. 35: 524. 1900. Chihuahua to Oaxaca and Puebla.

Shrub, 1 to 1.5 meters high; leaves mostly deltoid-ovate, 2 to 9 cm. long, obtuse, crenate, whitish-tomentose beneath, usually green above; racemes short or elongate, mostly dense; calyx 5 to 7 mm. long; corolla blue.

32. *Salvia dugesii* Fernald, Proc. Amer. Acad. 36: 500. 1901.

Guanajuato, Querétaro, and Mexico; type from Guanajuato.

Shrub; leaves 1.5 to 4.5 cm. long, obtuse, very rugose, crenate, whitish-tomentose beneath, usually green above; racemes dense, elongate; calyx 7 mm. long, violaceous; corolla 1.5 cm. long. "Chfa cimarrona" (Guanajuato).

33. *Salvia lasiantha* Benth. Lab. Gen. & Sp. 276. 1834.

?*Salvia keerlii* Benth. Lab. Gen. & Sp. 263. 1834.

Durango to San Luis Potosí and Oaxaca.

Shrub, 1 to 2.5 meters high; leaves mostly ovate-deltoid, 2 to 4.5 cm. long, obtuse, crenulate, whitish-tomentose beneath, usually green above; racemes dense, elongate; calyx 5 to 7 mm. long, bluish or purplish; corolla about 12 mm. long.

34. *Salvia semiatrata* Zucc. Abh. Akad. Wiss. München 1: 298. 1829-30.

Oaxaca.

Shrub, 1 to 2 meters high; leaves ovate-deltoid, 1.5 to 3.5 cm. long, obtuse, crenulate, whitish-tomentose beneath, green and very rugose above; racemes lax; corolla about 2 cm. long, the lower lip nearly black.

35. *Salvia rupicola* Fernald, Proc. Amer. Acad. 45: 420. 1910.

Type from Ixmiquilpan, Hidalgo.

Shrub; leaves 1 to 2 cm. long, obtuse, glandular-pilose beneath, green and rugose above, crenate; racemes 5 to 9 cm. long; corolla 1 cm. long.

36. *Salvia gonzalezii* Fernald, Proc. Amer. Acad. 35: 524. 1900.

Type collected between El Parián and Etla, Oaxaca, altitude 370 meters.

Stems villous and glandular-puberulent; leaves broadly ovate, 1 to 2.5 cm. long, obtuse, crenulate, white-villous beneath; racemes 5 to 15 cm. long; corolla deep blue, 1.5 cm. long.

37. *Salvia thyrsoflora* Benth. Bot. Voy. Sulph. 151. 1844.

Tepic to Michoacán; type from Tepic.

Shrub, 1 to 2 meters high; leaves ovate-lanceolate, short-petiolate, 2 to 5 cm. long, crenate, tomentose beneath, green above; calyx 4 to 5 mm. long; corolla about 1.5 cm. long.

38. *Salvia multiramea* Fernald, Proc. Amer. Acad. 35: 525. 1900.

Guerrero to Chiapas; type collected near the city of Oaxaca.

Plants about 1 meter high, suffrutescent; leaves 2 to 7 cm. long, crenulate, tomentose beneath, short-petiolate; corolla blue or white, 10 to 12 mm. long.

39. *Salvia alamosana* Rose, Contr. U. S. Nat. Herb. 1: 110. 1890.

Type from Sierra de Alamos, Sonora.

Plants about a meter high, herbaceous or suffrutescent; leaves 5 to 7.5 cm. long, crenate, tomentose beneath; corolla blue, 1 cm. long.

40. *Salvia chapalensis* Briq. Ann. Cons. Jard. Genève 2: 145. 1898.

Type from Lake Chapala, Jalisco.

Leaves ovate, 4 to 5 cm. long, crenate, green above, white-tomentose beneath; corolla blue, about 1.5 cm. long.

41. *Salvia aspera* Mart. & Gal. Bull. Acad. Brux 11²: 71. 1844.

Puebla and Oaxaca; type from mountains of Oaxaca.

Shrub, 1.5 meters high or less; leaves deltoid or deltoid-ovate, 1.5 to 2.5 cm. long, obtuse, truncate or subcordate at base, crenate, green and rugose above, tomentose beneath; calyx 2 cm. long; corolla 4 cm. long.

42. *Salvia chrysantha* Mart. & Gal. Bull. Acad. Brux. 11²: 72. 1844.

Guerrero to Chiapas and Puebla; type from Cordillera of Oaxaca. Reported from Costa Rica.

Shrub, 1 to 3 meters high; leaves oblong-ovate to broadly ovate, 3 to 7 cm. long, obtuse or acute, rounded at base, crenulate, green above, densely tomentose beneath; racemes dense or interrupted, covered with beautiful yellow wool; calyx about 1 cm. long; corolla 2 to 3 cm. long, yellow, red within.

43. *Salvia adglutinans* Lag. Gen. & Sp. Nov. 2. 1816.

Described from "Nova Hispania," the type collected by Sessé and Mociño.

Leaves ovate-lanceolate, cordate at base, acute, serrate, viscid-villous beneath when young; corolla scarlet, pubescent, 4 times as long as the calyx.

44. *Salvia sessei* Benth. Lab. Gen. & Sp. 288. 1834.

Rhodochlamys speciosa Schauer, Linnaea 30: 707. 1847.

Salvia roezli Scheidw. Fl. Serr. Jard. 14: 31. pl. 1407. 1861.

Salvia semperflorens Llave, Naturaleza 7: Apend. 81. 1885.

Salvia fastuosa Sessé & Moc. Pl. Nov. Hisp. 7. 1887.

Morelos and Guerrero.

Shrub, 2.5 to 4.5 meters high; leaves 5 to 13 cm. long, long-acuminate, crenate-serrate or subentire, yellow-glandular beneath; racemes lax, paniculate; calyx 2.5 cm. long, bright red; corolla scarlet, about 5 cm. long.

45. *Salvia regla* Cav. Icon. Pl. 5: 33. pl. 455. 1799.

Salvia deltoidea Pers. Syn. Pl. 1: 28. 1817.

Salvia crenata Mart. & Gal. Bull. Acad. Brux. 11²: 74. 1844.

Coahuila and Durango to Oaxaca and Hidalgo; type from Regla, Hidalgo.

Shrub, 1 to 2 meters high; leaves obtuse, coarsely crenate, green; flowers axillary or in short racemes; calyx 1.5 to 2 cm. long, bright red; corolla scarlet, 4 to 5 cm. long.

46. *Salvia pubescens* Benth. Lab. Gen. & Sp. 723. 1834.

Oaxaca; type from San Dionisio.

Shrub or small tree, 1 to 6 meters high; leaves 4.5 to 10 cm. long, acute or acuminate, crenate, green; flowers axillary or in short racemes; calyx red, 1.5 cm. long; corolla scarlet, 4 to 5 cm. long.

47. *Salvia muralis* Fernald, Proc. Amer. Acad. 43: 65. 1907.

Iguala Canyon, Guerrero, altitude about 800 meters.

Shrub, 1 to 3 meters high; leaves slender-petiolate, 6 to 10 cm. long, acuminate, coarsely crenate, green; racemes short, the flowers mostly geminate; calyx 1.5 to 2 cm. long, green or reddish; corolla scarlet, 4.5 to 6 cm. long.

48. *Salvia disjuncta* Fernald, Proc. Amer. Acad. 35: 533. 1900.

Chiapas.

Leaves deltoid-ovate, obtuse to acuminate, crenulate, green, somewhat tomentose beneath; calyx in anthesis 12 to 15 mm. long; corolla 3 to 4 cm. long.

49. *Salvia greggii* A. Gray, Proc. Amer. Acad. 8: 369. 1870.

Coahuila and Durango; type from Saltillo, Coahuila.

Low shrub; leaves mostly 1 to 1.5 cm. long, obtuse, usually entire and glabrous; calyx 10 to 12 mm. long, purplish; corolla red, 2.5 to 3 cm. long.

50. *Salvia oaxacana* Fernald, Proc. Amer. Acad. 35: 536. 1900.

Type from La Joya Canyon, Oaxaca, altitude 1,380 meters.

Shrub, much branched; leaves ovate, 1 cm. long or less, truncate or cordate at base, crenate, rugose above, white-tomentose beneath; calyx 8 to 10 mm. long, glandular-pilose.

51. *Salvia oresbia* Fernald, Proc. Amer. Acad. 35: 536. 1900.

San Luis Potosí; type from San Rafael.

Plants suffrutescent, about 30 cm. high, the branches glabrate; leaves ovate to rounded-ovate, 1 to 3 cm. long, obtuse or acute, appressed-serrate, glabrate; calyx purplish, 10 to 14 mm. long; corolla slightly over 2 cm. long.

52. *Salvia grahami* Benth. in Lindl. Bot. Reg. 16: *pl.* 1370. 1830.

Chihuahua and Coahuila to San Luis Potosí, Puebla, and Michoacán; type from Tlapujahua.

Low shrub; leaves petiolate, narrowly or broadly ovate, mostly 1 to 3 cm. long, obtuse or acute, crenate or subentire, green; racemes short or elongate, interrupted; calyx 7 to 12 mm. long, green or purplish; corolla red, 22 to 28 mm. long.

53. *Salvia microphylla* H. B. K. Nov. Gen. & Sp. 2: 295. 1817.

Salvia microphylla canescens A. Gray, Proc. Amer. Acad. 21: 407. 1886.

Salvia microphylla wislizeni A. Gray, Proc. Amer. Acad. 21: 408. 1886.

Chihuahua to San Luis Potosí, Puebla, and Mexico; type from Santa Rosa, Guanajuato.

Low shrub; leaves petiolate, obtuse or acute, crenate or subentire, densely or sparsely pubescent beneath; calyx 7 to 12 mm. long, green or bluish; corolla red, 2 to 2.5 cm. long. "Mirto" (Puebla, Jalisco); "pabellón mexicano"; "salvia del monte" (*Ramírez*); "toronjil" (Guerrero); "bandera mexicana" (Oaxaca, *Reko*).

54. *Salvia schaffneri* Fernald, Proc. Amer. Acad. 35: 535. 1900.

Type from mountains near Morales, San Luis Potosí.

Branches glandular-puberulent; leaves deltoid-ovate, acuminate, crenulate, puberulent, petiolate; racemes 15 cm. long or less; calyx 10 to 12 mm. long. "Mirto grande."

55. *Salvia lemmoni* A. Gray, Proc. Amer. Acad. 20: 309. 1885.

Chihuahua and Sonora. Arizona; type from Huachuca Mountains.

Plants suffrutescent, 30 to 60 cm. high, puberulent; leaves ovate or deltoid-ovate, crenulate, green, slender-petiolate; calyx 8 to 10 mm. long, glandular-puberulent.

56. *Salvia neurepia* Fernald, Proc. Amer. Acad. 35: 535. 1900.

San Luis Potosí and Mexico; type from Morales, San Luis Potosí.

Plants suffrutescent, the branches puberulent or villous; leaves ovate or rounded-ovate, rounded to subcordate at base, crenate, pubescent; racemes short or elongate; calyx 10 to 13 mm. long. "Mirto" (San Luis Potosí).

A decoction of the plant is a local remedy for fevers and headache.

57. *Salvia pringlei* Robins. & Greenm. Proc. Amer. Acad. 29: 391. 1894.

Type from Tequila, Jalisco.

Shrub, 1 to 2 meters high, the branches glabrate; leaves ovate, 4 to 9.5 cm. long, acuminate, obtuse or rounded at base, serrate, slender-petiolate; racemes dense; calyx 1.5 cm. long; corolla rose-purple, 3.5 to 4 cm. long, villous.

58. *Salvia involucrata* Cav. Icon. Pl. 2: 3. *pl.* 105. 1793.

Salvia laevigata H. B. K. Nov. Gen. & Sp. 2: 295. *pl.* 147. 1817.

Mexico, Hidalgo, and Puebla. Guatemala.

Plants suffrutescent; leaves ovate or oblong-ovate, 6 to 12 cm. long, acuminate, crenate-serrate, paler beneath; racemes dense, elongate; calyx about 1.5 cm. long, red or purplish.

59. *Salvia pulchella* DC. Cat. Hort. Monsp. 142. 1813.

Chiapas. Guatemala.

Plants large, herbaceous or suffrutescent; leaves broadly ovate, 8 cm. long or less, acuminate, crenate, paler beneath; racemes elongate; calyx green; corolla red, about 3 cm. long.

- 60. *Salvia adenophora*** Fernald, Proc. Amer. Acad. **35**: 538. 1900.
Oaxaca; type from Jayacatlán.
Shrub, the branches glandular-pilose; leaves cordate-ovate, 4 to 10 cm. long, obtuse or acute, crenate-serrate, tomentose beneath; racemes 30 cm. long or less; calyx 8 to 10 mm. long in anthesis; corolla red.
- 61. *Salvia fulgens*** Cav. Icon. Pl. **1**: 15. pl. 23. 1791.
Salvia cardinalis H. B. K. Nov. Gen. & Sp. **2**: 300. pl. 152. 1817.
Salvia boucheana Kunth, Ind. Sem. Hort. Berol. 1845.
Salvia grandiflora Sessé & Moc. Pl. Nov. Hisp. **7**. 1887.
Zacatecas to Michoacán and Puebla.
Plants 1 to 3 meters high, herbaceous or suffrutescent; leaves ovate, 5 to 12 cm. long, acuminate, cordate or rounded at base; racemes short or elongate; corolla red.
- 62. *Salvia orizabensis*** Fernald, Proc. Amer. Acad. **35**: 538. 1900.
Type from Mount Orizaba.
Stems short-pilose, glandular above; leaves ovate, 4 to 8 cm. long, subcordate at base; calyx 15 to 17 mm. long in anthesis.
- 63. *Salvia chiapensis*** Fernald, Proc. Amer. Acad. **35**: 544. 1900.
Chiapas.
Plants herbaceous or suffrutescent, the stems puberulent below, villosulous above; leaves ovate or oblong-ovate, 5 to 12 cm. long, acute, serrate, canescent-tomentose beneath; calyx 7 to 8 mm. long in anthesis.
- 64. *Salvia antennifera*** Briq. Ann. Cons. Jard. Genève **2**: 168. 1894.
Type from Chiapas.
Shrub, the stems villous; leaves 10 to 14 cm. long, acuminate, sparsely pilose, serrate; calyx about 8 mm. long, glandular-pilose.
- 65. *Salvia curviflora*** Benth. Lab. Gen. & Sp. 284. 1834.
Michoacán and Hidalgo; type from Tlalpujahua, Michoacán.
Plants fruticose, the branches tomentose; leaves ovate-oblong, acute, crenate-serrate, tomentose beneath.
- 66. *Salvia miniata*** Fernald, Proc. Amer. Acad. **35**: 545. 1900.
Chiapas.
Glabrate shrub; leaves oblong-lanceolate, 15 to 20 cm. long, sharply serrate; corolla 3 to 3.2 cm. long, red.
- 67. *Salvia aristulata*** Mart. & Gal. Bull. Acad. Brux. **11**²: 67. 1844.
Salvia longistyla Benth. Lab. Gen. & Sp. 295. 1834.
Jalisco to Oaxaca and Veracruz; type from Capulalpan, Oaxaca.
Plants suffrutescent, 1 to 3 meters high; leaves long-petiolate, rounded-ovate, 7 to 18 cm. long, acute or acuminate, crenate, thin, green; racemes elongate, lax; calyx 2 to 2.5 cm. long; corolla 3.5 to 4.5 cm. long, curved.
- 68. *Salvia cyclophylla*** Fernald, Proc. Amer. Acad. **35**: 551. 1900.
Type collected between Tlapancingo, Oaxaca, and Talixtaquilla, Guerrero.
Shrub; leaves rounded-cordate, 6 to 7 cm. long, rounded at apex, crenate, thin, sparsely short-pilose; calyx glandular-pilose; corolla 25 to 27 mm. long.
- 69. *Salvia incana*** Mart. & Gal. Bull. Acad. Brux. **11**²: 68. 1844.
Type from Tehuacán, Puebla.
Plants suffrutescent, canescent-hirsute; leaves cordate-ovate, 2.5 cm. long, acutish, crenate, whitish-tomentose beneath; racemes short; corolla 3.5 cm. long.

70. *Salvia perlonga* Fernald, Proc. Amer. Acad. 35: 546. 1900.

Type from the Sierra Madre near Chilpancingo, Guerrero.

Shrub, the branches hispid-pilose; leaves acuminate, crenate, green and rugose above, whitish-tomentose beneath; racemes 10 to 20 cm. long; calyx purplish, 13 mm. long; corolla 3 cm. long, red.

71. *Salvia graciliflora* Mart. & Gal. Bull. Acad. Brux. 11²: 75. 1844.

Type from Zacuapan, Veracruz.

Stems suffrutescent; leaves ovate, 5 cm. long, acuminate, serrate; racemes short; calyx canescent-tomentose; corolla about 2.5 cm. long.

72. *Salvia purpurea* Cav. Icon. Pl. 2: 52. pl. 166. 1793.

Salvia affinis Schlecht. & Cham. Linnaea 5: 99. 1830.

Salvia purpurea pubens A. Gray, Proc. Amer. Acad. 22: 446. 1887.

Durango and Jalisco to Chiapas and Veracruz. Central America.

Plants herbaceous or suffrutescent, 1 to 3 meters high, the stems usually minutely puberulent or glabrate; leaves ovate or broadly ovate, 5 to 10 cm. long, acuminate, serrate; racemes dense, short or elongate; calyx usually purple-tomentose. "Chichinguaste" (Guatemala).

73. *Salvia littae* Visiana, Padov. Nuov. Sagg. 6: 87. 1847.

Oaxaca.

Stems chiefly herbaceous, 1 to 1.5 meters high; leaves ovate or rounded-ovate, 5 to 9 cm. long, acute, crenate-serrate; racemes dense; corolla purplish-villous.

74. *Salvia rosei* Fernald, Proc. Amer. Acad. 35: 548. 1900.

Type collected between Colotlán and Bolaños, Jalisco.

Shrub; leaves ovate, 3.5 to 6 cm. long, obtuse or acute, crenate-serrate; racemes 10 cm. long or less; calyx puberulent; corolla 2.5 to 3 cm. long.

75. *Salvia arbuscula* Fernald, Proc. Amer. Acad. 45: 421. 1910.

Type from the Sierra Madre of Michoacán or Guerrero, altitude 1,500 meters.

Shrub, 2.5 meters high, the branches lanate; leaves ovate, about 10 cm. long, acuminate, subcordate at base, white-tomentose beneath; racemes elongate; corolla 2.5 to 3 cm. long.

76. *Salvia iodantha* Fernald, Proc. Amer. Acad. 35: 547. 1900.

Type from Cuernavaca, Morelos, altitude 2,340 meters.

Plants herbaceous or suffrutescent, 1 to 1.5 meters high, the stems puberulent; leaves 7 cm. long or less, short-acuminate, serrate; racemes 10 to 20 cm. long, subsecund; calyx in anthesis 5 mm. long; corolla slightly more than 2 cm. long.

77. *Salvia michoacana* Fernald, Proc. Amer. Acad. 35: 548. 1900.

Jalisco and Michoacán; type from Pátzcuaro, Michoacán.

Shrub, 1 to 3 meters high, the branches puberulent; leaves 5 to 12 cm. long, acuminate, crenate or serrate; racemes dense, 5 to 15 cm. long; calyx 4 to 5 mm. long; corolla 2 to 2.5 cm. long.

78. *Salvia nervata* Mart. & Gal. Bull. Acad. Brux. 11²: 77. 1844.

Type from Sierra de San Felipe, Oaxaca. Guatemala.

Plants herbaceous or suffrutescent, the stems puberulent; leaves ovate or ovate-lanceolate, 5 to 8 cm. long, acuminate; racemes secund, lax; calyx 10 to 14 mm. long; corolla about 3.5 cm. long.

79. *Salvia karwinskii* Benth. Lab. Gen. & Sp. 725. 1834.

Type from somewhere in Mexico.

Stems lanate; leaves ovate, acuminate, rounded at base, lanate beneath; calyx glandular-villous.

80. *Salvia cinnabarina* Mart. & Gal. Bull. Acad. Brux. 11²: 63. 1844.

Oaxaca and Chiapas; type from Cerro de San Felipe, Oaxaca. Guatemala.

Plants herbaceous or suffrutescent; leaves ovate, 3 to 12 cm. long, acute or acuminate, obtuse or rounded at base, serrulate, thinly tomentose or glabrate beneath; racemes elongate; corolla bright red, about 3 cm. long.

81. *Salvia elegans* Vahl, Enum. Pl. 1: 238. 1804.

Salvia incarnata Cav. Anal. Cienc. Nat. 2: 112. 1800. Not *S. incarnata* Etling. 1777.

Salvia punicea Mart. & Gal. Bull. Acad. Brux. 11²: 65. 1844.

Salvia microcalyx Scheele, Linnaea 22: 589. 1849.

Salvia longiflora Sessé & Moc. Pl. Nov. Hisp. 8. 1887.

Salvia elegans sonorensis Fernald, Proc. Amer. Acad. 35: 550. 1900.

Sonora and Chihuahua to Veracruz and Oaxaca.

Plants fruticose or herbaceous; leaves chiefly ovate, 3 to 10 cm. long, obtuse to acuminate, serrate or crenate, pubescent or glabrate beneath; racemes lax, elongate; corolla bright red, 3 to 3.5 cm. long.

82. *Salvia mollissima* Mart. & Gal. Bull. Acad. Brux. 11²: 71. 1844.

Type from Oaxaca.

Stems chiefly herbaceous, hirsute; leaves ovate-lanceolate, 7.5 cm. long, acuminate, crenate, white-tomentose beneath; calyx 8 to 10 mm. long; corolla 2.5 cm. long.

83. *Salvia coccinea* Juss.; Murr. Comm. Gött. 1: 86. pl. 1. 1778.

Salvia pseudococcinea Jacq. Coll. Bot. 2: 302. 1788.

Salvia ciliata Benth. Lab. Gen & Sp. 286. 1834.

Salvia galeottii Mart.; Mart. & Gal. Bull. Acad. Brux. 11²: 75. 1844.

Salvia coccinea pseudococcinea Kuntze, Rev. Gen. Pl. 2: 530. 1891.

Tamaulipas and Nuevo León to Tepic, Chiapas, and Yucatán. Widely distributed in tropical America.

Stems usually herbaceous but sometimes suffrutescent, commonly hirsute; leaves ovate or deltoid, 1.5 to 5 cm. long, obtuse or acute, crenate, tomentose or pubescent beneath; racemes short or elongate; calyx 6 to 9 mm. long; corolla about 2.5 cm. long, bright red. "Mirto" (Nuevo León).

This species is commonly cultivated as an ornamental plant under the names "salvia" and "scarlet sage." Several horticultural forms are known.

3. CUNILA L. Syst. Nat. ed. 10. 1359. 1759.

Low shrubs or herbs; leaves serrate or entire; flowers small, in dense or loose clusters, these axillary or in terminal spikes; calyx tubular, 10 to 13-nerved, barbate in the throat, the 5 teeth subequal; corolla bilabiate; stamens 2.

Bractlets equaling the calyx; flowers sessile or nearly so, in dense spikes.

1. *C. lythrifolia*.

Bractlets much shorter than the calyx; flowers pedicellate.

Corolla more than twice as long as the calyx, usually 3 times as long.

2. *C. longiflora*.

Corolla less than twice as long as the calyx.

Flower clusters arranged in rounded cymes-----3. *C. pycnantha*.

Flower clusters spicate.

Leaves densely tomentose beneath-----4. *C. tomentosa*.

Leaves thinly villous or glabrate beneath.

Stems villosulous-----5. *C. polyantha*.

Stems glabrous-----6. *C. leucantha*.

1. *Cunila lythrifolia* Benth. in Edwards, Bot. Reg. 15: pl. 1289. 1829.? *Cunila stachyoides* Mart. & Gal. Bull. Acad. Brux. 11²: 190. 1844.

Hidalgo, Mexico, and Morelos.

Plants 0.6 to 2 meters high, herbaceous or suffrutescent, the stems densely pilose; leaves lance-oblong or oblong-ovate, 4 to 8 cm. long, acuminate, serrulate, tomentulose beneath; spikes very dense, villous; corolla purplish.

Cunila stachyoides was described from Orizaba.

2. *Cunila longiflora* A. Gray, Proc. Amer. Acad. 22: 444. 1887.

Jalisco; type from Río Blanco.

Plants slender, suffrutescent; leaves lanceolate to ovate, 3 to 6.5 cm. long, long-acuminate, serrulate or entire, thinly tomentulose beneath; flowers in lax pedunculate cymes; corolla 6 to 8 mm. long.

The writer has seen no specimens of *C. secunda* S. Wats.,¹ which was described from Guanajuato, where it is said to be known as "poleo de cerro." From the description it can not be distinguished from *C. longiflora*, and probably Watson's name should replace *C. longiflora*.

3. *Cunila pycnantha* Robins. & Greenm. Proc. Amer. Acad. 29: 391. 1894.

Jalisco, Michoacán, and Morelos; type from Nevado de Colima, altitude 2,100 meters.

Slender shrub, 1 to 2 meters high; leaves short-petiolate, oblong-lanceolate to ovate, 2.5 to 5.5 cm. long, long-acuminate, serrulate or entire, nearly glabrous; corolla white, 5 mm. long.

4. *Cunila tomentosa* Fernald, Proc. Amer. Acad. 35: 565. 1900.

Type collected between Plunia and San Miguel Suchistepec, Oaxaca, altitude 1,800 meters.

Stems sharply quadrangular; leaves lanceolate or ovate-lanceolate, 2 to 5 cm. long, acuminate, entire or serrulate; corolla 3 mm. long.

5. *Cunila polyantha* Benth. Lab. Gen. & Sp. 362. 1834.

Veraacruz, Oaxaca, and Guerrero. Guatemala.

Leaves narrowly lanceolate to broadly ovate, 2 to 5 cm. long, acute to long-acuminate, entire or serrulate, thinly tomentose or glabrate beneath; corolla white, about 4 mm. long.

6. *Cunila leucantha* Benth. Lab. Gen. & Sp. 361. 1834.

Described from Mexico.

Leaves ovate-oblong, 12 to 16 mm. long, entire, glabrous; cymes lax, 16 to 20-flowered, the pedicels pubescent; corolla white.

The writer has seen no specimens agreeing with the original description.

4. **POLIOMINTHA** A. Gray, Proc. Amer. Acad. 8: 295. 1870.

Low shrubs; leaves entire; flowers pink or purple, clustered in the leaf axils; calyx tubular, 13 to 15-striate, barbate in the throat, the 5 teeth equal or nearly so; corolla bilabiate, the upper lip erect, emarginate, the lower 3-cleft, the tube equaling or longer than the calyx; stamens 2.

The following species are the only ones known.

Flowers 2 to 3.5 cm. long.

Leaves oval to broadly ovate-----1. *P. longiflora*.Leaves linear-oblong-----2. *P. bicolor*.

¹ Proc. Amer. Acad. 18: 136. 1883.

Flowers less than 1.5 cm. long.

Leaves linear; calyx villous-hirsute-----3. *P. incana*.

Leaves oblong to suborbicular; calyx tomentulose.

Leaves glabrate, the pubescence simple-----4. *P. glabrescens*.

Leaves densely stellate-tomentose.

Leaves orbicular-ovate; corolla tube short-exserted-----5. *P. marifolia*.

Leaves oblong-ovate; corolla tube long-exserted-----6. *P. mollis*.

1. *Poliomintha longiflora* A. Gray, Proc. Amer. Acad. 8: 296. 1870.

Coahuila.

Shrub, about 30 cm. high; leaves 5 to 10 mm. long, rounded or obtuse at apex, canescent-tomentulose beneath with simple hairs, green above; corolla 2.5 to 3.5 cm. long, red. "Orégano."

The leaves are used for flavoring food and for making a beverage like tea.

2. *Policmintha bicolor* S. Wats. Proc. Amer. Acad. 25: 160. 1890.

Hedeoma bicolor Briq. Ann. Cons. Jard. Bot. Genève 2: 185. 1898.

Type from Sierra de la Silla, Nuevo León, altitude 1,500 meters.

Densely branched shrub, 30 cm. high or less; leaves 4 to 8 mm. long, obtuse, densely white-tomentulose beneath with simple hairs, glabrous above; corolla about 3 cm. long.

3. *Poliomintha incana* (Torr.) A. Gray, Proc. Amer. Acad. 8: 296. 1870.

Hedeoma incana Torr. U. S. & Mex. Bound. Bot. 130. 1859.

Chihuahua and Sonora. Western Texas to Arizona and Utah.

Shrub, 1 meter high or less; leaves 1 to 3 cm. long, densely whitish-tomentulose with simple hairs; corolla 10 to 12 mm. long, pale purplish.

The Hopi Indians of Arizona boil and eat the leaves and use the flowers for seasoning food.

4. *Poliomintha glabrescens* A. Gray; Hemsl. Biol. Centr. Amer. Bot. 2: 549. 1882.

Type from Soledad, southwest of Monclova, Coahuila. Western Texas.

Low glabrate shrub; leaves oblong, 7 to 18 mm. long, obtuse, conspicuously punctate; corolla about 12 mm. long.

5. *Poliomintha marifolia* (Schauer) A. Gray, Proc. Amer. Acad. 8: 365. 1870.

Keithia marifolia Schauer, Linnaea 20: 705. 1847.

San Luis Potosí and Hidalgo; type from Zimapán, Hidalgo.

Leaves petiolate, 5 to 15 mm. long, rounded or very obtuse at apex, white-tomentulose; corolla 12 to 14 mm. long.

6. *Poliomintha mollis* (Torr.) A. Gray, Proc. Amer. Acad. 8: 365. 1870.

Hedeoma mollis Torr. U. S. & Mex. Bound. Bot. 129. 1859.

Western Texas; type collected along the Rio Grande at Puerto de Paisano; doubtless extending into Mexico.

Leaves 1 to 2.5 cm. long, obtuse or acutish, petiolate; corolla 12 mm. long.

6. **SALAZARIA** Torr. U. S. & Mex. Bound. Bot. 133. 1859.

The genus was named for Don José Salazar, Mexican Commissioner of the United States and Mexican Boundary Survey. It consists of a single species.

1. *Salazaria mexicana* Torr. U. S. & Mex. Bound. Bot. 133. pl. 39. 1859.

Baja California, Chihuahua, and Coahuila; type collected in Chihuahua below Presidio del Norte. Utah to southern California.

Slender shrub, 1 meter high or less, the branches densely white-tomentose; leaves remote, short-petiolate, oblong to ovate, 2 cm. long or less, obtuse, entire or nearly so; flowers in few-flowered racemes; calyx subglobose, in fruit inflated and bladderlike, 1.5 cm. long, purplish, reticulate-veined; corolla about 2 cm. long, purplish; stamens 4.

7. OCIMUM L. Sp. Pl. 597. 1753.

Herbs or low shrubs; leaves petiolate, toothed; flowers in verticillate racemes; calyx deflexed in fruit, campanulate or ovoid, 5-lobate, the lobes unequal; corolla white or nearly so, the tube usually shorter than the calyx; stamens 4.

Calyx hirtellous or puberulent, the upper lobe decurrent nearly or quite to the base of the tube.....1. *O. micranthum*.

Calyx glabrous, the upper lobe decurrent to the middle of the tube or less.

2. *O. sellowii*.

1. *Ocimum micranthum* Willd. Enum. Pl. 630. 1809.

Sinaloa to Tamaulipas, Yucatán, and Colima. West Indies; Central and South America.

Plants essentially annual but sometimes suffrutescent, 60 cm. high or less; leaves oblong-ovate to broadly ovate, 2 to 9 cm. long, acute or obtuse, serrate or subentire, puberulent or glabrate; racemes 2 to 10 cm. long; calyx 6 to 7 mm. long in fruit; corolla 4 mm. long. "Albahaca cimarrona" (Porto Rico); "albahaca silvestre" (Guatemala); "albahaca," "albahaca montés" (El Salvador).

Ocimum campechianum Mill.,¹ described from Campeche, is probably not essentially different. It is said by Bentham to be more pubescent than *O. micranthum*. Specimens from the Yucatán Peninsula seen by the writer do not differ from the usual forms of *O. micranthum*.

In El Salvador bunches of the leaves of this plant are put in the ears as a remedy for earache.

2. *Ocimum sellowii* Benth. Lab. & Gen. Sp. 6. 1834.

San Luis Potosí and Veracruz. Brazil.

Plants herbaceous or suffrutescent, glabrous throughout or nearly so; leaves ovate or lance-ovate, 4 to 8 cm. long, acute or acuminate, acute at base, coarsely serrate; racemes 10 to 20 cm. long; calyx in fruit 8 mm. long; corolla 4 mm. long.

8. TRICHOSTEMA L. Sp. Pl. 598. 1753.

Herbs or low shrubs; leaves entire; flowers in axillary clusters or in thyrsiform panicles; calyx 5-dentate, 10-nerved, the limb equal or oblique; corolla tube slender, the limb subequally 5-lobate; stamens 4, the anterior ones longer.

Leaves linear; corolla tube short-exserted.....1. *T. parishii*.

Leaves ovate or broadly elliptic; corolla tube not exserted.....2. *T. arizonicum*.

1. *Trichostema parishii* Vasey, Bot. Gaz. 6: 173. 1880.

Trichostema lanatum denudatum A. Gray, Syn. Fl. ed. 2. 2¹: 459. 1886.

Northern Baja California. Southern California; type from San Diego County.

Low shrub; leaves 1 to 4.5 cm. long, sessile, glabrate above, tomentulose beneath, the margins revolute; inflorescence thyrsiform, nearly naked, covered with purple wool; corolla about 1 cm. long; stamens long-exserted.

¹ Gard. Dict. ed. 8. *Ocimum* no. 5. 1768.

2. *Trichostema arizonicum* A. Gray, Proc. Amer. Acad. 8: 371. 1872.

Northeastern Sonora. Arizona and New Mexico; type from Chiricahua Mountains, Arizona.

Plants 60 cm. high or less, woody below, puberulent; leaves petiolate, 1 to 2 cm. long, obtuse; flower clusters axillary, on long slender peduncles; corolla blue or whitish, 1 cm. long.

9. CLINOPODIUM L. Sp. Pl. 587. 1753.

Small shrubs or herbs; leaves entire or dentate; flowers axillary; calyx tubular, 13-nerved, bilabiate, the posterior lip 3-dentate, the anterior one 2-parted; corolla tube usually exserted, the limb bilabiate; stamens 4.

One herbaceous species occurs in Baja California.

Leaves 1 to 1.5 cm. long; petioles about as long as the blades.

1. *C. oaxacanum*.

Leaves mostly 3 to 7 cm. long; petioles much less than half as long as the blades.

Branches villous-hirsute.....2. *C. macrostemum*

Branches finely puberulent or glabrous.....3. *C. laevigatum*.

1. *Clinopodium oaxacanum* (Fernald) Standl.

Calamintha oaxacana Fernald, Proc. Amer. Acad. 35: 564. 1900.

Type collected between El Parián and Etna, Oaxaca, altitude 1,200 meters.

Shrub with slender glabrate branches; leaves elliptic-ovate, acute, sharply serrate; flowers solitary in the leaf axils; corolla red, about 3 cm. long.

2. *Clinopodium macrostemum* (Benth.) Kuntze, Rev. Gen. Pl. 2: 515. 1891.

Calamintha macrostema Benth. in DC. Prodr. 12: 229. 1848.

Mexico and Morelos, and perhaps in neighboring States.

Shrub, sometimes 2.5 meters high; leaves ovate or oblong-ovate, acuminate, serrate, sparsely villous-hirsute beneath; corolla about 3 cm. long. "Tabaquillo," "té del monte" (Mexico).

A decoction of the plant is employed as a remedy for affections of the stomach and intestines. The leaves are employed as a substitute for Chinese tea.

3. *Clinopodium laevigatum* Standl., sp. nov.

Sinaloa to Oaxaca; type from Cerro San Felipe, Oaxaca (Nelson 1117; U. S. Nat. Herb. no 565856).

Shrub, 0.5 to 1.5 meters high, the branchlets minutely puberulent or glabrate, barbate at the nodes; leaves short-petiolate, lance-oblong to ovate-oblong, 2 to 8 cm. long, acute or acuminate, obtuse or acute at base, serrate or subentire, usually glabrous but sometimes sparsely scabrous above and hirtellous beneath along the costa; flowers in few-flowered axillary pedunculate cymes; calyx about 9 mm. long, glabrous; corolla about 2.5 cm. long. "Poleo" (Sinaloa); "nurite," "té nurite" (Michoacán); "guie-zaa" (Oaxaca, Zapotec, *Reko*); "hierba del borracho" (Oaxaca); "té del monte" (Oaxaca, Michoacán).

Tea made from the leaves, sweetened with sugar, is a popular beverage in some places along the western coast of Mexico. It is considered a remedy for kidney troubles and a good tonic after malarial and other fevers.

10. HYPTIS Jacq. Coll. Bot. 1: 101. 1786.

Shrubs or herbs; leaves usually toothed; calyx tubular, ovoid, or campanulate, the 5 lobes equal; corolla bilabiate, the upper lip erect or spreading, the lower saccate; stamens 4.

Numerous herbaceous species of the genus occur in Mexico.

Flowers in loose panicles. Corolla 2 cm. long or larger.

Leaves clasping at base; calyx minutely glandular-puberulent.....1. *H. nelsonii*.

Leaves not clasping; calyx glandular-hispid.....2. *H. langlassei*.

Flowers in heads, umbels, or fascicles, these variously arranged.

Calyx lobes spreading in fruit.

Calyx lobes in fruit equaling or usually shorter than the tube.

3. *H. stellulata*.

Calyx lobes longer than the tube.....4. *H. mociniana*.

Calyx lobes erect in fruit.

Flowers sessile or nearly so.

Calyx in fruit 8 to 10 mm. long.....5. *H. rhytidea*.

Calyx about 2 mm. long.....6. *H. seemanni*.

Flowers all or mostly slender-pedicellate.

Flowers clusters all sessile or nearly so.

Leaves with a very dense, minute, close tomentum on the upper surface.....7. *H. tephrodes*.

Leaves with a coarse tomentum on the upper surface, or the tomentum fine but sparse.

Leaves lance-oblong to oblong-ovate, usually acute or acuminate.

8. *H. albida*.

Leaves mostly rounded-ovate and very obtuse....12. *H. emoryi*.

Flower clusters all or mostly pedunculate.

Lobes of the calyx half as long as the tube or less....9. *H. tomentosa*.

Lobes of the calyx more than half as long as the tube.

Leaves soon glabrate, green.

Calyx lobes linear-subulate; leaves broadly ovate, usually acute.

10. *H. laniflora*.

Calyx lobes lanceolate; leaves suborbicular, rounded at apex.

11. *H. insularis*.

Leaves densely whitish-tomentose on one or both surfaces.

12. *H. emoryi*.

1. *Hyptis nelsonii* Fernald, Proc. Amer. Acad. 35: 366. 1900.

Type collected between San Sebastián and summit of Monte Bufa de Mascota, Jalisco, altitude 1,850 meters.

Leaves linear-lanceolate, 15 to 20 cm. long, attenuate, serrulate or entire, glabrous; panicles 40 to 50 cm. long, lax; calyx in fruit 1 cm. long.

2. *Hyptis langlassei* Fernald, Proc. Amer. Acad. 45: 422. 1910.

Type from the Sierra Madre of Michoacán or Guerrero, altitude 1,800 meters.

Shrub, 2 meters high; leaves lanceolate, 10 to 17 cm. long, acuminate, sub-cuneate at base, acutely dentate, glabrous; calyx in fruit 8 to 9 mm. long; corolla red.

3. *Hyptis stellulata* Benth. Lab. Gen. & Sp. 129. 1834.

Hyptis pubescens Benth. Lab. Gen. & Sp. 129. 1834.

Hyptis spinulosa Benth. Lab. Gen. & Sp. 129. 1834.

Hyptis punctata Mart. & Gal. Bull. Acad. Brux. 11²: 186. 1844.

Sonora to Oaxaca and Morelos.

Plants shrubby or suffrutescent, 1.5 to 3 meters high; leaves narrowly lanceolate to broadly ovate or ovate-oval, 2 to 8 cm. long, obtuse to long-attenuate, serrate, puberulent or tomentulose beneath; flowers sessile or nearly so in dense clusters, these spicate-paniculate; corolla white. "Salvia cimarrona" (Sinaloa).

4. *Hyptis mociniana* Benth. Lab. Gen. & Sp. 129. 1834.

Veracruz and Chiapas. Central America.

Plants shrubby or suffrutescent, 1 to 2.5 meters high; leaves ovate, 2 to 4 cm. long, acuminate, rounded or subcordate at base, serrate, tomentulose beneath; flowers sessile in dense clusters, these spicate-paniculate; corolla white. "Verbena montés," "chichinguastón" (El Salvador).

5. *Hyptis rhytidea* Benth. Pl. Hartw. 21. 1839.

Sinaloa and Durango to Jalisco and Aguascalientes; type from Aguascalientes.

Plants shrubby or suffrutescent, 1.5 to 2.5 meters high; leaves oblong or lance-oblong, 4 to 13 cm. long, acute or obtuse, serrate, coriaceous, scabrous above, tomentose or glabrate beneath; inflorescence spicate-paniculate. "Salvia prieta" (Sinaloa).

Used in Sinaloa as a remedy for fevers.

6. *Hyptis seemanni* A. Gray, Proc. Amer. Acad. 21: 407. 1886.

Hyptis seemanni stenophylla Robinson, Proc. Bost. Soc. Nat. Hist. 31: 267. 1904.

Chihuahua, Sonora, and Sinaloa.

Shrub; leaves linear-lanceolate to oblong-lanceolate, 4 to 7 cm. long, attenuate, crenate or serrate, tomentose beneath; flower heads small, sessile, spicate-paniculate; calyx densely villous in the throat and outside. "Salvia" (Sinaloa).

7. *Hyptis tephrodes* A. Gray, Proc. Amer. Acad. 5: 164. 1861.

Baja California; type from Cape San Lucas.

Shrub, 1.5 to 2.5 meters high; leaves lanceolate or lance-oblong, 3 to 7 cm. long, acute, crenate or serrate; flower clusters spicate-paniculate, the panicles nearly naked; calyx densely white-lanate.

Doubtfully distinct from *H. albida*.

8. *Hyptis albida* H. B. K. Nov. Gen. & Sp. 2: 319. 1817.

Sonora and Chihuahua to San Luis Potosí, Guanajuato, and Guerrero; type from Lake Cuitzeo, Guanajuato.

Shrub, 1.5 to 4.5 meters high, stellate-tomentose throughout; leaves 2 to 6 cm. long, crenate-serrate, prominently reticulate-veined; flower clusters spicate-paniculate, the panicles leafy or naked; calyx densely white-lanate; corolla blue. "Salvia" (Sinaloa, Jalisco, Aguascalientes); "orégano" (Sinaloa); "salvia real" (Guerrero).

The leaves are sometimes used for flavoring food. In Sinaloa they are employed as a remedy for ear-ache, and in Guerrero a decoction of the plant is used in fomentations to relieve rheumatic pains.

9. *Hyptis tomentosa* Poit. Ann. Mus. Paris 7: 469. 1806.

Puebla and Guerrero to Chiapas.

Shrub, 1.5 to 3 meters high, stellate-tomentose; leaves oblong to ovate or oval, 1 to 7 cm. long, obtuse, crenate; flower clusters chiefly axillary, the flowers long-pedicellate; calyx stellate-tomentose; corolla about 12 mm. long, violet.

10. *Hyptis laniflora* Benth. Bot. Voy. Sulph. 42. pl. 20. 1844.

Baja California; type from Cape San Lucas.

Shrub, 1.5 to 2.5 meters high; leaves 1 to 4.5 cm. long, coarsely dentate, coriaceous; flower clusters on long, slender, usually glabrous, purplish peduncles; calyx densely white-lanate. "Salvia."

A decoction of the plant is administered as a remedy for fevers.

11. *Hyptis insularis* (Standl. & Goldm.) Standl.

Mesosphaerum insulare Standl. & Goldm. Contr. U. S. Nat. Herb. 13: 375. 1911.

Type from Espiritu Santo Island, Baja California.

Shrub with spreading branches; leaves 1 to 2 cm. long, rounded or truncate at base, sinuate-dentate; peduncles slender, glabrous; calyx 6 mm. long, densely lanate.

Probably only a form of *H. laniflora*.

12. *Hyptis emoryi* Torr. in Ives, Rep. Colo. Riv. 20. 1861.

Sonora, Tepic, and Baja California. Southern Arizona and California.

Slender shrub, 1 to 2 meters high; leaves oblong-ovate to broadly ovate, 1 to 5 cm. long, crenate or coarsely dentate; flower clusters axillary or in nearly naked paniced racemes; calyx densely lanate; corolla violet, about 4 mm. long. "Salvia" (Sonora, Baja California).

Hyptis palmeri S. Wats.¹, described from Guaymas, Sonora, is probably not distinct.

11. **MONARDELLA** Benth. Lab. Gen. & Sp. 331. 1834.

At least two herbaceous species occur in Baja California.

1. *Monardella thymifolia* Greene, Bull. Calif. Acad. 1: 211. 1885.

Cedros Island, Baja California.

Low shrub, puberulent throughout; leaves ovate to broadly ovate, 5 to 10 mm. long, obtuse, entire or remotely serrulate, short-petiolate; flowers in dense terminal heads, the bracts large and conspicuous; calyx tubular, 7 mm. long, equally 5-dentate; stamens 4.

12. **SPHACELE** Benth. in Edwards, Bot. Reg. pl. 1289. 1829.

Plants woody or suffrutescent; leaves crenate; flowers solitary or in few-flowered clusters, axillary or in terminal racemes; calyx campanulate, about 10-nerved, reticulate-veined, 5-dentate, the teeth subequal; corolla tube amplicate above, the limb scarcely bilabiate, 4-lobate; stamens 4.

Flowers solitary in the leaf axils; leaves 1 to 2 cm. long-----1. *S. mexicana*.
Flowers in terminal racemiform panicles; leaves 10 to 25 cm. long.

2. *S. hastata*.

1. *Sphacele mexicana* Schauer, Linnaea 20: 707. 1847.

San Luis Potosí, Hidalgo, and Puebla; type from Zimapán, Hidalgo.

Shrub, 30 cm. high or less, densely stellate-tomentose throughout; leaves petiolate, triangular-hastate, obtuse, crenate, rugose, the margins revolute; flowers short-pedicellate, hidden among the leaves; calyx 6 mm. long.

2. *Sphacele hastata* A. Gray, Proc. Amer. Acad. 5: 341. 1862.

Baja California. Hawaii.

Plants tall and coarse, perhaps wholly herbaceous, thinly or densely stellate-tomentose; leaves narrowly triangular-hastate, acute or acuminate, petiolate; calyx 6 to 7 mm. long; corolla 2.5 cm. long or less.

13. **GARDOQUIA** Ruiz & Pav. Prodr. Fl. Peruv. Chil. 86. 1794.

Small shrubs; leaves entire or serrate; flowers solitary or clustered in the leaf axils; calyx tubular, 13-nerved, the 5 teeth subequal; corolla tube usually exserted, the limb bilabiate; stamens 4.

¹ Proc. Amer. Acad. 24: 68. 1889.

- Leaves linear-oblong, entire.....1. *G. micromerioides*.
 Leaves ovate or broadly ovate, serrate.
 Leaves 2 to 3 mm. long.....2. *G. helleri*.
 Leaves mostly 5 to 9 mm. long.....3. *G. mexicana*.
1. *Gardoquia micromerioides* Hemsl. Biol. Centr. Amer. Bot. 2: 550. 1882.
 San Luis Potosí.
 Plant suffrutescent, 40 cm. high or less, glabrate; leaves subsessile, 6 to 18 mm. long; flowers solitary, 12 to 18 mm. long; calyx 6 to 8 mm. long.
2. *Gardoquia helleri* Peyr. Linnaea 30: 34. 1859.
 Type from Tepetitlán, Orizaba, Veracruz, altitude 2,400 to 2,700 meters.
 Small much-branched shrub; leaves short-petiolate, acutish, 2 to 4-dentate, glabrous; flowers solitary; calyx 5 to 6 mm. long, corolla 18 to 25 mm. long.
 Probably only a form of *G. mexicana*.
3. *Gardoquia mexicana* Benth. Pl. Hartw. 50. 1840.
 Hidalgo to Guerrero, Oaxaca, and Veracruz; type from Regla, Hidalgo.
 Low shrub, the branchlets minutely puberulent; leaves petiolate, obtuse or acute, serrulate, glabrous; calyx 6 mm. long; corolla 22 to 34 mm. long.

148. SOLANACEAE. Potato Family.

Shrubs or trees or often herbs, erect or scandent, often armed with prickles, the pubescence frequently of branched hairs; leaves mostly alternate, simple or compound; flowers perfect, usually in cymes, regular or nearly so; calyx inferior, usually 5-parted, gamosepalous; corolla gamopetalous, varying from tubular to rotate, the limb usually 5-lobate; stamens as many as the corolla lobes and alternate with them, attached to the corolla tube; style simple, the stigma discoid or bilamellate; fruit baccate or capsular, many-seeded.

Several genera besides those listed are represented in Mexico by herbaceous species.

- Ovary 1-celled.....13. LITHOPHYTUM.
 Ovary with 2 or more cells.
 Fruit capsular.....1. NICOTIANA.
 Fruit baccate.
 Embryo straight or nearly so. Leaves entire.
 Fruit many-seeded; corolla lobes imbricate.....2. JUANULLOA.
 Fruit few-seeded; corolla lobes induplicate-valvate.....3. CESTRUM.
 Embryo curved.
 Ovary 4-celled.
 Corolla lobes imbricate.....4. SWARTZIA.
 Corolla lobes induplicate-valvate.....5. DATURA.
 Ovary 2-celled.
 Corolla lobes imbricate.....6. LYCIUM.
 Corolla lobes valvate or induplicate-valvate.
 Corolla funnellform.....7. ACNISTUS.
 Corolla salverform or campanulate.
 Anthers opening by terminal pores.....8. SOLANUM.
 Anthers opening by longitudinal slits.
 Calyx accrescent after anthesis.
 Calyx longer than the fruit and contracted above it.
 9. ATHENAEA.
 Calyx equaling or shorter than the fruit, not contracted.
 10. WITHANIA.

Calyx only slightly if at all accrescent.

Corolla broadly campanulate, 5-angulate or shallowly lobate.

11. BRACHISTUS.

Corolla subrotate, cleft to the middle or more deeply.

12. BASSOVIA.

1. NICOTIANA L. Sp. Pl. 180. 1753.

Several herbaceous species occur in Mexico. Best known among them, of course, is the tobacco ("tabaco") plant, *Nicotiana tabacum* L.

1. *Nicotiana glauca* Graham, Edinburgh Phil. Journ. 1828: 174. 1828.

Sonora to Tamaulipas and Oaxaca. Western Texas to southern California; native of Argentina and Uruguay, but thoroughly naturalized in some parts of North America.

Glabrous shrub or small tree, 6 meters high or less; leaves long-petiolate, lance-oblong to broadly ovate, 5 to 17 cm. long, acute or obtuse, entire, glaucous; flowers greenish white, in lax terminal panicles; calyx tubular-campanulate, 12 mm. long, 5-dentate; corolla tubular, about 4 cm. long, villosulous, with narrow limb; fruit a 2-celled capsule, 1 to 1.5 cm. long. "Virginio" (Chihuahua, Durango); "gigante" (Aguascalientes, Sinaloa, San Luis Potosí, Texas); "tabaquillo" (Oaxaca, Mexico); "tronadora" (Chihuahua, Guanajuato, Texas); "mostaza montés" (Oaxaca); "Don Juan" (Sonora); "lengua de buey" (Sinaloa); "marihuana" (Sinaloa, Sonora); "árbol de tabaco" (Durango); "tabaco cimarrón" (Mexico); "buena moza" (Querétaro); "tepozán extranjero" (Querétaro); "tabaco amarillo" (Jalisco); "gretaña" (Oaxaca, Reko); "tabacón," "tacote," "palo virgen" (Durango, Patoni); "conetón" (Texas); "palo virgen," "Marquiana," "hierba del gigante."

This plant is abundant in some parts of Mexico. It is reputed to be very poisonous. The leaves are often applied as poultices to relieve pain, especially headache.

2. JUANULLOA Ruiz & Pav. Fl. Peruv. Chil. Prodr. 27. 1794.

1. *Juanulloa mexicana* (Schlecht.) Miers, Ann. Mag. Nat. Hist. 4: 188. 1849.

Laureria mexicana Schlecht. Linnaea 8: 513. 1833.

Juanulloa aurantiaca Otto & Dietr. Allg. Gartenz. 12: 265. 1844.

Juanulloa hookeriana Miers, Ann. Mag. Nat. Hist. 4: 189. 1849.

Juanulloa elliptica Ruiz & Pav.; Dunal in DC. Prodr. 13¹: 530. 1852.

Veracruz, Oaxaca, and Chiapas; type from Hacienda de la Laguna, Veracruz.

Shrub, usually epiphytic; leaves short-petiolate, elliptic to ovate, 6 to 22 cm. long, rounded to acute at apex, acute to rounded at base, glabrous above, stellate-puberulent or tomentose beneath, entire; flowers in few-flowered long-pedunculate cymes; calyx 2.5 to 3.5 cm. long, cleft into 5 oblong-lanceolate lobes, stellate-tomentulose; corolla tubular, 4 to 4.5 cm. long, orange or reddish; fruit baccate.

3. CESTRUM L. Sp. Pl. 191. 1753.

Shrubs or small trees; leaves petiolate, entire; flowers whitish, yellowish, red, or purple, in cymes; calyx 5-lobate or 5-dentate; corolla salverform or funnellform, with long tube, the limb with 5 usually spreading lobes; stamens included, the filaments filiform, often appendaged; fruit a 2-celled berry.

- Corolla red, purple, or yellow, somewhat ampliate above, contracted at the mouth.
- Calyx lobes very short, obtuse. Corolla yellow, glabrous.....1. *C. flavescens*.
Calyx lobes usually elongate, acute to attenuate.
- Corolla glabrous.
- Leaves glabrous beneath.....2. *C. endlicheri*.
Leaves tomentose or villous beneath.
- Calyx glabrous.....3. *C. purpureum*.
Calyx villous.....4. *C. roseum*.
- Corolla puberulent or villous outside.
- Corolla lobes broadly ovate or deltoid, short, erect....5. *C. fasciculatum*.
Corolla lobes lance-oblong, elongate, spreading.....6. *C. benthami*.
- Corolla usually white or greenish, the tube gradually broadened from base to apex, not contracted at the mouth.
- Filaments appendaged at the point of insertion.
- Leaves tomentose, pubescent, or puberulent beneath.
- Pubescence of stellate hairs.
- Corolla more than twice as long as the calyx.....7. *C. lanatum*.
Corolla less than twice as long as the calyx.....8. *C. pacificum*.
- Pubescence of simple hairs.
- Corolla tube 8 to 10 mm. long.....9. *C. dumetorum*.
Corolla tube 18 mm. long.....10. *C. hirtellum*.
- Leaves glabrous beneath.
- Leaves coriaceous, mostly 5 to 8 cm. wide.....11. *C. laurifolium*.
Leaves thin or only slightly coriaceous, mostly less than 5 cm. wide.
- Calyx 4 to 6 mm. long.
- Corolla 20 to 26 mm. long.....12. *C. oblongifolium*.
Corolla 15 mm. long.....13. *C. pedunculare*.
Calyx 2 to 3 mm. long.....14. *C. nocturnum*.
- Filaments not appendaged.
- Tube of the corolla twice as long as the calyx or shorter.
- Calyx 10 to 15 mm. long.....15. *C. fulvescens*.
Calyx 8 mm. long or less.
- Calyx villous or tomentose.....16. *C. confertiflorum*.
Calyx glabrous.
- Calyx 4 mm. long.....17. *C. anagyris*.
Calyx 6 to 8 mm. long.....18. *C. thyrsoideum*.
- Tube of the corolla usually more than 3 times as long as the calyx.
- Corolla 8 to 12 mm. long; stigma short-exserted.....19. *C. diurnum*.
Calyx 14 to 25 mm. long or larger; stigma usually included.
- Calyx 2 to 2.5 mm. long.....20. *C. viride*.
Calyx 4 to 6 mm. long.
- Leaves thick, the lateral nerves nearly obsolete; corolla brownish or rufescent when dry.....21. *C. laxum*.
Leaves thin, the lateral nerves conspicuous beneath; corolla greenish when dry.....22. *C. nitidum*.
1. *Cestrum flavescens* Greenm. Proc. Amer. Acad. 34: 572. 1899.
Type from Cuernávaca, Morelos, altitude 1,500 meters.
Shrub, about 1 meter high; leaves slender-petiolate, oblong-ovate to rounded-ovate, 3 to 5 cm. long, acuminate to very obtuse at apex; flowers pedicellate; calyx 5 mm. long, glabrous; corolla 2 to 2.5 cm. long, orange.

2. *Cestrum endlicheri* Miers, Lond. Journ. Bot. 5: 151. 1846.

Meyenia corymbosa Schlecht. Linnaea 8: 252. 1833. Not *Cestrum corymbosum* Schlecht. 1832.

Veracruz; type from Chiconquiaco.

Glabrous shrub; leaves lance-oblong or ovate-oblong, 13 cm. long or less, long-acuminate, rounded at base; flowers in lax elongate corymbs; calyx 5 to 6 mm. long; corolla red, 2 to 2.5 cm. long.

3. *Cestrum purpureum* (Lindl.) Standl.

Habrothamnus purpureus Lindl. in Edwards, Bot. Reg. 30: pl. 43. 1844.

Habrothamnus paniculatus Mart. & Gal. Bull. Acad. Brux. 12²: 148. 1845.

Not *Cestrum paniculatum* H. B. K. 1819.

Cestrum elegans Schlecht. Linnaea 19: 261. 1847.

Cestrum sylvaticum Dunal in DC. Prodr. 13¹: 603. 1852.

Cestrum elegans truncatum Fernald, Proc. Amer. Acad. 35: 571. 1900.

Veracruz and Oaxaca; described from cultivated plants.

Shrub, 1 to 3.5 meters high; leaves short-petiolate, ovate to lance-oblong, 6.5 to 12 cm. long, acuminate, rounded or obtuse at base, subcoriaceous; flowers in dense terminal cymes; calyx 5 to 6 mm. long, purplish; corolla purple, 1.5 to 2.5 cm. long; fruit red-purple, 10 to 12 mm. long. "Flor del soldado" (Veracruz, Ramírez); "flor de colmena" (Veracruz, Seler).

Cestrum elegans truncatum is a form with subtruncate corolla limb.

4. *Cestrum roseum* H. B. K. Nov. Gen. & Sp. 3: 59. pl. 197. 1819.

Cestrum chiapense T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 192. 1915.

Hidalgo to Chiapas; type from Morán, Hidalgo; reported from Oaxaca.

Shrub; leaves oblong to elliptic-oval, 6.5 cm. long or less, acute to rounded at apex, thin, petiolate; flowers sessile or nearly so, crowded, terminal and axillary; corolla pink or purplish, 2 to 2.5 cm. long. "Hediondilla" (Hidalgo, Oaxaca, Ramírez).

It is possible that *C. chiapense* is a distinct species, but the specimens agree well with the descriptions of *C. roseum*.

5. *Cestrum fasciculatum* (Schlecht.) Miers, Lond. Journ. Bot. 5: 151. 1846.

Meyenia fasciculata Schlecht. Linnaea 8: 251. 1833.

Cestrum hartwegi Dunal in DC. Prodr. 13¹: 599. 1852.

Veracruz, Puebla, and Oaxaca; type from Chiconquiaco, Veracruz. Guatemala.

Shrub, 1 to 2 meters high; leaves lance-oblong to broadly ovate, 13 cm. long or less, acute, rounded or obtuse at base, short-petiolate; flowers in dense, chiefly terminal cymes; calyx about 6 mm. long, villosulous or glabrate; corolla about 2 cm. long, red-purple; fruit globose, 12 mm. long. "Hierba del perro" (Oaxaca, Ramírez).

6. *Cestrum benthami* Miers, Lond. Journ. Bot. 5: 151. 1846.

Habrothamnus tomentosus Benth. Pl. Hartw. 49. 1840. Not *Cestrum tomentosum* L. f. 1781.

Hidalgo, Puebla, Oaxaca, and Mexico; type from Real del Monte, Hidalgo.

Shrub, 1 to 2 meters high; leaves oblong-lanceolate to broadly ovate, 12 cm. long or less, acute or acuminate, obtuse or rounded at base, villous-tomentose beneath; flowers sessile, fasciculate chiefly terminal; calyx 8 to 10 mm. long, villous; corolla purple, 2.5 to 3 cm. long; fruit 1 to 1.5 cm. long.

7. *Cestrum lanatum* Mart. & Gal. Bull. Acad. Brux. 12^o: 18. 1845.

Durango and Tepic to Chiapas and Veracruz; type from Mirador, Veracruz. Central America.

Shrub, 2 to 6 meters high; leaves mostly lanceolate or lance-oblong, 6 to 15 cm. long, acute to long-acuminate, densely stellate-tomentose beneath, at least when young; cymes dense, axillary and terminal; calyx densely tomentose; corolla greenish white, 13 to 17 mm. long; fruit about 1 cm. long. "Ahuacatillo" (Guanajuato); "candelilla" (Durango); "zorrillo" (Costa Rica); "chacuaco" (Veracruz); "palo hediondo," "huele de noche" (El Salvador).

The plant has a strong and disagreeable odor. A decoction of the wood is said to have cathartic properties, and is employed as a remedy for fevers. The black fruit is reported to yield a dye. The leaves are sometimes placed in hens' nests to keep away vermin.

8. *Cestrum pacificum* T. S. Brandeg. Erythea 7: 6. 1899.

Socorro Island.

Shrub, stellate-tomentose throughout; leaves oblong-ovate to broadly ovate, 6 to 11 cm. long, acute or obtuse, sometimes glabrate above in age; flowers mostly sessile, in terminal and axillary cymes; corolla 12 mm. long.

9. *Cestrum dumetorum* Schlecht. Linnaea 7: 61. 1832.

?*Cestrum semivestitum* Dunal in DC. Prodr. 13^o: 651. 1852.

Nuevo León to Veracruz, Oaxaca, and Morelos; type from Veracruz.

Shrub, 2 to 6 meters high; leaves lanceolate to oblong-ovate, 16 cm. long or less, usually long-acuminate, glabrous above, sparsely villosulous or glabrate beneath; cymes small, mostly axillary; corolla about 1.5 cm. long, greenish yellow; fruit 1 cm. long or smaller, black. "Potonxihuite" (Oaxaca); "galán," "huele de día" (Nuevo León); "palo hediondo" (Tamaulipas, El Salvador); "chacuaco," "hediondilla," "tepozán" (Veracruz); "huele de noche" (Veracruz, El Salvador); "tiscuite," "hediondo" (El Salvador).

A decoction of the plant is employed in Tamaulipas as a remedy for cutaneous diseases. In El Salvador the plant is reputed to be poisonous to cattle.

10. *Cestrum hirtellum* Schlecht. Linnaea 7: 62. 1832.

Type from Hacienda de la Laguna, near Jalapa, Veracruz.

Leaves broadly or narrowly lanceolate, obtuse or acute, glabrate in age; calyx about 3 mm. long; corolla greenish white.

11. *Cestrum laurifolium* L'Hér. Stirp. Nov. 4: 69. 1785.

Cestrum alaternoides Desf. Tabl. Ecol. Bot. Mus. 70. 1804.

Michoacán and Guerrero to Veracruz. West Indies; Central America.

Shrub or small tree, 6 meters high or less, glabrous throughout or nearly so; leaves mostly elliptic-oblong and 11 to 16 cm. long, lustrous, acute or short-acuminate; cymes lateral or axillary; calyx 2.5 to 3.5 mm. long; corolla 12 to 16 mm. long, greenish white; fruit 7 to 9 mm. long. "Galán de día" (Cuba), "tiscuite," "palo hediondo," "huele de noche" (El Salvador).

12. *Cestrum oblongifolium* Schlecht. Linnaea 19: 266. 1847.

?*Cestrum lancifolium* Schlecht. Linnaea 19: 267. 1847.

Type from Los Reyes; the type of *C. lancifolium* collected between Los Baños and Puente de Dios, Veracruz.

Shrub, 1 to 1.5 meters high; leaves lance-oblong, 11 cm. long or less, acuminate, glabrous; calyx 4 mm. long, pubescent.

13. *Cestrum pedunculare* Pavón; Dunal in DC. Prodr. 13¹: 618. 1852.

Type from somewhere in Mexico.

Leaves ovate-lanceolate, 5 cm. long or less, acuminate, glabrous; flowers in axillary pedunculate racemes; calyx 5 to 6 mm. long, glabrous.

14. *Cestrum nocturnum* L. Sp. Pl. 191. 1753.

Cestrum nocturnum mexicanum O. E. Schluz in Urban, Symb. Antill. 6: 256. 1909.

Coahuila to Guerrero, Oaxaca, and Veracruz. West Indies and Central America.

Shrub, 4.5 meters high or less, glabrous throughout or nearly so; leaves mostly oblong-lanceolate, 5 to 12 cm. long, acuminate; flowers mostly in axillary cymes; corolla 18 to 25 mm. long, greenish white; fruit 8 to 10 mm. long. "Huele de noche" (Puebla, Coahuila, Veracruz, Jalisco, Oaxaca, Guatemala); "hierba hedionda" (*Ramírez*); "pipiloxihuitl" (*Ramírez*); "galán de tarde" (Oaxaca, *Reko*); "galán de noche" (Guatemala, Cuba); "dama de noche" (Porto Rico, Philippines); "reina de la noche" (Guatemala); "palo hediendo" (El Salvador).

The flowers are very fragrant, especially at night. The juice and the fruit are reported to be poisonous, but an extract of the plant has been employed as an antispasmodic, especially for the treatment of epilepsy.

The Mexican and Central American material (*C. nocturnum mexicanum* O. E. Schulz) differs from the West Indian in having slightly smaller flowers. *C. graciliflorum* Dunal¹ is probably a synonym.

15. *Cestrum fulvescens* Fernald, Proc. Amer. Acad. 35: 572. 1899.

Cestrum arborescens T. S. Brandeg. Zoe 5: 256. 1908.

Michoacán to Puebla and Oaxaca; type from mountains of Telixtlahuaca, Oaxaca, altitude 2,000 meters.

Shrub, glabrous throughout or nearly so; leaves narrowly lanceolate to elliptic-oblong, 11 cm. long or less, acute or acuminate; cymes mostly axillary and racemiform, lax, the flowers mostly pedicellate; calyx angulate, somewhat inflated, contracted below into a slender stipe; corolla 2 to 2.5 cm. long; fruit 10 to 12 mm. long.

16. *Cestrum confertiflorum* Schlecht. Linnaea 19: 263. 1847.

Cestrum terminale Dunal in DC. Prodr. 13¹: 608. 1852.

Jalisco, Michoacán, and Mexico; type from Angangueo, Michoacán.

Shrub, about 2 meters high; leaves oblong-lanceolate, 9 to 15 cm. long, acuminate, glabrous, pale beneath; cymes dense, chiefly in terminal panicles; calyx 6 to 7 mm. long; corolla 14 to 16 mm. long. "Hierba de la mula" (Mexico, *Villada*).

17. *Cestrum anagyris* Dunal in DC. Prodr. 13¹: 608. 1852.

Mexico; type from Toluca.

Leaves ovate-elliptic, 5 cm. long or less, acute, glabrous; flowers pedicellate; corolla 10 to 11 mm. long.

18. *Cestum thyrsoideum* H. B. K. Nov. Gen. & Sp. 3: 63. 1818.

Cestrum persicaefolium Dunal in DC. Prodr. 13¹: 608. 1852.

Cestrum involucreatum Dunal in DC. Prodr. 13¹: 610. 1852.

Michoacán, Mexico, Puebla, and Tlaxcala; type from Chalco, Mexico.

¹ In DC. Prodr. 13¹: 669. 1852.

Shrub, 1 to 2.5 meters high, glabrous throughout or nearly so; leaves petiolate, mostly oblong-lanceolate, 8 to 18 cm. long, acuminate or rarely obtuse, pale beneath; flowers in terminal paniced cymes; corolla about 1.5 cm. long.

19. *Cestrum diurnum* L. Sp. Pl. 191. 1753.

Sinaloa (probably cultivated) and Yucatán. West Indies.

Shrub, usually about a meter high; leaves oblong or oblong-elliptic, 6.5 to 12 cm. long, acute or obtuse, glabrous; flowers mostly in axillary pedunculate racemes; calyx 3.5 mm. long, glabrous or somewhat tomentose; corolla white; fruit about 6 mm. long. "Juan de noche" (Yucatán); "galán de día" (Cuba).

20. *Cestrum viride* Moric.; Dunal in DC. Prodr. 13¹: 606. 1852.

Described from plants cultivated in Mexico; specimens from Puebla and Michoacán or Guerrero perhaps belong here.

Shrub, 3 to 4 meters high; leaves oblong-lanceolate, 17 cm. long or less, long-acuminate, glabrous, short-petiolate, rounded or obtuse at base; flowers in axillary or terminal, often paniced cymes; corolla about 1.5 cm. long.

21. *Cestrum laxum* Benth. Pl. Hartw. 33. 1840.

Cestrum psychotriaefolium Schlecht. Linnaea 19: 265. 1847.

Cestrum bourgeauianum Fernald, Proc. Amer. Acad. 35: 572. 1900.

San Luis Potosí and Guanajuato to Mexico and Oaxaca; type from León, Guanajuato.

Shrub, 2 to 4.5 meters high, glabrous throughout or nearly so; leaves lanceolate to oblong or oblong-elliptic, 10 cm. long or less, acute or acuminate; cymes axillary and terminal, the flowers mostly pedicellate; corolla 16 to 22 mm. long. "Paloma" (Veracruz).

22. *Cestrum nitidum* Mart. & Gal. Bull. Acad. Brux. 12²: 19. 1845.

Michoacán to Morelos and Oaxaca; type from mountains of Oaxaca.

Shrub or small tree, 1.5 to 6 meters high, glabrous throughout or nearly so; leaves slender-petiolate, lanceolate to elliptic, 7 to 11 cm. long, acuminate; cymes chiefly in terminal panicles, the flowers mostly pedicellate; corolla 22 to 30 mm. long.

DOUBTFUL SPECIES.

CESTRUM AMYGDALIFOLIUM Dunal in DC. Prodr. 13¹: 653. 1852. Assigned doubtfully to Mexico.

CESTRUM EHRENBERGII Dunal in DC. Prodr. 13¹: 613. 1852. Type from Chapultepec.

CESTRUM MULTINERVIUM Dunal in DC. Prodr. 13¹: 611. 1852. Type collected between Tula and Tampico.

CESTRUM PROPINQUUM Mart. & Gal. Bull. Acad. Brux 12²: 147. 1845. Type from Jalapa, Veracruz.

4. *SWARTZIA* Gmel. Syst. Nat. 2: 360. 1791.

Shrubs, often scandent; leaves entire; flowers large, white or yellow; calyx tubular, 2 to 5-lobate; corolla funnelform, the lobes broad, imbricate, spreading in anthesis; stamens 5, the filaments filiform; fruit baccate, 2-celled.

Calyx and lower surface of leaves tomentose or pubescent.....1. *S. guttata*.

Calyx and leaves glabrous.....2. *S. nitida*.

1. *Swartzia guttata* (Don) Standl.

Solandra guttata Don in Edwards, Bot. Reg. pl. 1551. 1832.

Durango and Zacatecas, and perhaps elsewhere.

Plants subscaudent, 7 meters long or more, the stems 5 to 7 cm. in diameter; leaves petiolate, lance-elliptic to broadly elliptic, 7 to 15 cm. long, abruptly short-acuminate, glabrate above, loosely tomentose beneath or finally glabrate; calyx 6 to 7 cm. long; corolla about 20 cm. long, cream-colored, changing in age to snuff-colored and orange, with bands of purple inside. "Floripondio del monte" (Durango).

The flowers are fragrant.

2. *Swartzia nitida* (Zucc.) Standl.

Solandra nitida Zucc. in Roem. Coll. Bot. 128. 1809.

Datura maxima Sessé & Moc. Pl. Nov. Hisp. 25. 1887.

Solandra selerae Dammer; Loesener, Bull. Herb. Boiss. 3: 617. 1895.

Solandra hartwegii N. E. Brown, Kew Bull. Misc. Inf. 1911: 345. 1911.

Veracruz, Puebla, and Oaxaca.

Scandent or erect shrub, glabrous; leaves long-petiolate, oblong to broadly elliptic, 7 to 18 cm. long, obtuse or abruptly short-acuminate, lustrous; calyx 5 to 7 cm. long, the lobes acuminate; corolla 18 to 25 cm. long, yellow, the limb 20 cm. broad or less. "Tecomaxochitl" (Nahuatl); "copa de oro"; "bolsa de Judas"; "gorro de Napoleón"; "tetona" (Veracruz).

A showy plant, often cultivated for ornament. The water contained in the calyx before the flowers open is said to be applied to the eyes to relieve inflammation.

This species has been reported from Mexico as *Solandra grandiflora* Swartz, a West Indian plant. *Solandra macrantha* Dunal, described from Cuba, is probably a synonym of *S. nitida*.

5. **DATURA** L. Sp. Pl. 179. 1753.

REFERENCE: Safford, Synopsis of the genus *Datura*, Journ. Washington Acad. Sci. 11: 173-189. 1921.

Shrubs or small trees, often herbs; leaves petiolate, entire, dentate, or lobate; flowers large, solitary; calyx elongate-tubular, persistent or deciduous; corolla funnelform, the limb 5-lobate; fruit capsular or baccate.

Several herbaceous species occur in Mexico.

Calyx spathaceous, the limb split along one side but otherwise entire.

1. **D. candida**.

Calyx limb 5-lobate.

Calyx longer than the narrow tubular portion of the corolla...2. **D. arborea**.

Calyx shorter than the narrow tubular portion of the corolla.

3. **D. suaveolens**.1. *Datura candida* (Pers.) Pasquale, Cat. Ort. Bot. Nap. 36. 1867.

Brugmansia candida Pers. Syn. Pl. 1: 216. 1805.

Sinaloa to Veracruz and Oaxaca. Central America.

Shrub, 2.5 to 4.5 meters high; leaves long-petiolate, broadly ovate to oblong-ovate, 40 cm. long or less, acuminate, entire or repand, villosulous or glabrate; flowers sweet-scented; corolla white, about 25 cm. long, the lobes caudate-acuminate. "Floripondio" (Querétaro, Jalisco, San Luis Potosí, Oaxaca, El Salvador, Nicaragua); "floripundio," "trómbita" (Michoacán, León); "campanilla blanca" (Colima); "almizclillo" (Ramírez) "campana" (Guatemala); "reina de la noche" (Costa Rica); "florifundia," "floricundia" (El Salvador).

This plant is common in cultivation in the warmer parts of Mexico, being extremely showy when in flower. It has usually been known as *D. arborea*. Some of the cultivated forms have double flowers. It is, probably, this species of which Acosta wrote in 1606, as follows: "It is true that many of these flowers [of New Spain] are only good to look at, for their odor is not good, or is ordinary, or else they have none at all, but there are some of excellent odor. Such are those that grow on a tree called *floripondio*, which has no fruit, but bears only flowers, which are larger than fleur de lys, shaped like hand-bells, all white, and having within filaments such as one sees in a lily. It bears flowers all the year long, whose odor is wondrously sweet and pleasant, especially in the fresh morning air. The Viceroy Don Francisco de Tollede sent some of these trees to King Philip, as a thing worthy of being planted in the royal gardens."

2. *Datura arborea* L. Sp. Pl. 179. 1753.

The only Mexican specimens seen are from Sinaloa, where the plant is probably cultivated. Native of South America, the type from Peru.

Shrub or small tree; leaves broadly ovate or elliptic, acuminate, entire or repand, villosulous; corolla white, 15 to 18 cm. long, the lobes long-cuspidate; fruit subglobose, about 6 cm. long, "*Floripondio*" (Colombia, Peru, Ecuador); "*borrachero*," "*guante*" (Colombia); "*floripundio*" (Sinaloa).

In Peru the leaves are applied as poultices to sores to relieve pain and accelerate suppuration.

Datura sanguinea Ruiz & Pav., a South American species with red flowers, is cultivated about the City of Mexico.

3. *Datura suaveolens* Humb. & Bonpl.; Willd. Enum. Pl. 227. 1809.

Yucatán, probably in cultivation. Central and South America.

Shrub or small tree; leaves broadly ovate to oblong-ovate, acuminate, mostly entire, finely villosulous or glabrate; corolla white, 25 to 30 cm. long, the lobes cuspidate. "*Campanilla*," "*flor de campana*," "*floripundio blanco*," "*árbol de la bibijagua*" (Cuba).

6. LYCIUM L. Sp. Pl. 191. 1753.

Shrubs, sometimes scandent, usually spiny; leaves entire, small; flowers solitary or fasciculate in the axils or in terminal cymes, white or purplish; calyx campanulate or tubular-campanulate, 3 to 5-lobate; corolla funnelform or salverform, with short or elongate tube, the limb 4 or 5-lobate; stamens included or exserted; fruit a globose or ovoid, 2-celled berry.

The fruit of the Mexican species is edible but insipid. The Indians formerly made considerable use of it, sometimes drying and preserving it until winter. The leaves of *L. barbarum* L., of the Mediterranean region, have been employed as a substitute for Chinese tea. The young shoots of *L. europaeum* L. are said to be eaten as a vegetable in Spain and Italy.

Corolla tube 12 mm. long or more, tubular, only slightly ampliate above.

Lobes of the calyx equaling or longer than the tube.

Stamens exserted; lobes of the calyx nearly or fully twice as long as the tube-----1. *L. macrodon*.

Stamens included; lobes of the calyx about equaling the tube.

Leaves glabrous-----2. *L. schaffneri*.

Leaves glandular-puberulent-----3. *L. puberulum*.

- Lobes of the calyx shorter than the tube.
 Stamens exerted-----4. *L. exsertum*.
 Stamens included.
 Leaves obovate to broadly elliptic, 5 to 20 mm. wide--5. *L. umbellatum*.
 Leaves spatulate-oblongate, usually less than 5 mm. wide.
 6. *L. gracilipes*.
- Corolla tube 8 mm. long or less, often ampliate above.
 Pedicels strongly compressed, sharply angulate above; calyx lobes very unequal, glabrous-----7. *L. carinatum*.
 Pedicels not compressed or sharply angulate; calyx lobes not very unequal or, if so, puberulent.
 Calyx lobes narrow, lanceolate or subulate, equaling or longer than the tube.
 Leaves glabrous; calyx lobes 1 to 1.5 mm. long----8. *L. geniculatum*.
 Leaves usually puberulent; calyx lobes mostly 2 to 4 mm. long.
 9. *L. richii*.
- Calyx lobes broad, usually deltoid, shorter than the tube.
 Lobes of the corolla longer than the tube-----10. *L. carolinianum*.
 Lobes of the corolla shorter than the tube or rarely equaling it.
 Leaves sparsely short-pilose-----11. *L. retusum*.
 Leaves glabrous or minutely puberulent.
 Corolla 7 to 10 mm. long.
 Leaves glabrous.
 Leaves 3 mm. wide or less-----12. *L. berlandieri*.
 Leaves mostly 4 to 7 mm. wide-----13. *L. torreyi*.
 Leaves puberulent-----14. *L. cedrosense*.
- Corolla 4 to 6 mm. long.
 Tube of the corolla not exceeding the calyx lobes.
 15. *L. californicum*.
 Tube of the corolla not exceeding the calyx lobes.
 Corolla lobes spreading or ascending-----16. *L. barbinodum*.
 Corolla lobes recurved-----17. *L. peninsulare*.
1. *Lycium macrodon* A. Gray, Proc. Amer. Acad. 6: 46. 1862.
 Sonora. Type from southern Nevada or California.
 Spiny shrub; leaves oblong-oblongate or elliptic, 1 to 4 cm. long, obtuse or acute, glabrous; calyx 1 cm. long or less; corolla pale lilac, about 1.5 cm. long; fruit orange.
2. *Lycium schaffneri* A. Gray; Hemsl. Biol. Centr. Amer. Bot. 2: 426. 1882.
 Zacatecas and San Luis Potosí; type from San Luis Potosí.
 Leaves lance-oblong or oblongate-oblong, 1.5 to 3.5 cm. long, obtuse or acute, sessile or nearly so; calyx 4 mm. long, glabrous; corolla 1.5 cm. long; fruit about 8 mm. long.
3. *Lycium puberulum* A. Gray, Proc. Amer. Acad. 6: 46. 1862.
 Western Texas, along the Rio Grande, and doubtless occurring in Mexico.
 Spiny shrub, about a meter high; leaves obovate or oblongate-oblong, 8 to 15 mm. long, obtuse; calyx lobes spreading or recurved; corolla nearly 1.5 cm. long, white, the lobes deltoid.
4. *Lycium exsertum* A. Gray, Proc. Amer. Acad. 20: 305. 1885.
 Sonora; type from Altar.
 Spiny shrub, 1 to 2 meters high; leaves spatulate-obovate or elliptic, 1 to 3.5 cm. long, acute to rounded at apex, viscid-puberulent; flowers slender-pedicellate; calyx about 6 mm. long, viscid-puberulent; corolla lobes very short, rounded; fruit orange or red.

5. *Lycium umbellatum* Rose, Contr. U. S. Nat. Herb. 1: 74. 1890.

Baja California; type from La Paz.

Shrub, 2 to 3.5 meters high, unarmed or with spinose branchlets; leaves 1.5 to 3 cm. long, obtuse or rounded at apex, short-petiolate, viscid-puberulent; flowers long-pedicellate; calyx 6 to 8 mm. long, tubular; corolla purple, 1.5 cm. long.

6. *Lycium gracilipes* A. Gray, Proc. Amer. Acad. 12: 81. 1877.

Northern Sonora. Arizona; type from Williams Fork.

Leaves 1 to 2 cm. long, obtuse, attenuate to base, viscid-puberulent; flowers long-pedicellate; calyx tubular-campanulate, 6 mm. long; corolla about twice as long as the calyx, purple or whitish, the lobes rounded.

7. *Lycium carinatum* S. Wats. Proc. Amer. Acad. 24: 65. 1889.

Sonora; type from Guaymas.

Thorny, glabrous shrub, about 1 meter high; leaves linear-spatulate or narrowly spatulate, 5 to 20 mm. long, obtuse; flowers slender-pedicellate; corolla white, 4 to 6 mm. long. "Sal sieso" (Palmer).

8. *Lycium geniculatum* Fernald, Proc. Amer. Acad. 35: 566. 1900.

Oaxaca and Puebla; type from Tehuacán, Puebla.

Spiny shrub; leaves oblong or obovate, 2.5 cm. long or less, obtuse or acute, very glaucous, slender-petiolate; flowers in small terminal cymes, long-pedicellate; corolla 12 mm. long, the lobes cordate.

9. *Lycium richii* A. Gray, Proc. Amer. Acad. 6: 46. 1862.

Lycium palmeri A. Gray, Proc. Amer. Acad. 8: 292. 1870.

Lycium pringlei A. Gray, Proc. Amer. Acad. 20: 305. 1885.

Baja California, Sonora, and Sinaloa; type from La Paz, Baja California. Southern California.

Spiny shrub, 1.5 to 2.5 meters high, finely puberulent throughout; leaves obovate or oblanceolate, usually about 1 cm. long, obtuse or acute, sessile or nearly so; flowers short-pedicellate; calyx about 3 mm. long; corolla lilac, 8 to 10 mm. long; fruit red. "Frutilla" (Baja California).

10. *Lycium carolinianum* Walt. Fl. Carol. 84. 1788.

?*Lycium quadrifidum* Sessé & Moc.; Dunal in DC. Prodr. 13¹: 513. 1852.

In saline marshes or alkaline soil, Baja California, Michoacán, and Tamaulipas. Southern United States.

Glabrous spiny shrub, the long branches trailing or subscandent; leaves oblanceolate-oblong to linear-spatulate, 3 cm. long or less, obtuse or acute; flowers slender-pedicellate; calyx irregularly lobate; corolla purple, the limb subrotate, about 12 mm. broad.

11. *Lycium retusum* Robins. & Fern. Proc. Amer. Acad. 30: 120. 1894.

Type from Oputo, Sonora.

Shrub, 2 to 3 meters high; leaves broadly obovate, 2 cm. long or less, petiolate, rounded or retuse at apex, cuneate at base; flowers slender-pedicellate; calyx tubular, 5 mm. long, glandular-pubescent; corolla 8 mm. long.

12. *Lycium berlandieri* Dunal in DC. Prodr. 13¹: 520. 1852.

?*Lycium brevipes* Benth. Bot. Voy. Sulph. 40. 1844.

Lycium senticosum Miers, Ann. Mag. Nat. Hist. II. 14: 138. 1854.

Lycium stolidum Miers, Ann. Mag. Nat. Hist. II. 14: 191. 1854.

Baja California to Nuevo León and Hidalgo. Western Texas; type from San Antonio.

Spiny shrub, 1 to 2.5 meters high; leaves linear-spatulate, obtuse, about 1 cm. long; flowers on long or short pedicels. "Cilindrillo" (Coahuila).

13. *Lycium torreyi* A. Gray, Proc. Amer. Acad. 6: 47. 1862.

Chihuahua. Western Texas to southern California; type collected in Texas on the Rio Grande.

Spiny shrub, 1 to 2.5 meters high, glabrous; leaves 3.5 cm. long or less, obtuse or acute, attenuate to base; flowers short-pedicellate; corolla about 1 cm. long, purplish; fruit red. "Garambullo" (Chihuahua); "tomatillo" (New Mexico).

14. *Lycium cedrosense* Greene, Pittonia 1: 268. 1889.

Lycium andersonii pubescens S. Wats. Proc. Amer. Acad. 24: 65. 1889.

Baja California; type from Cedros Island.

Spiny shrub, finely puberulent throughout; leaves obovate to narrowly spatulate, 1 cm. long or less, obtuse; flowers short-pedicellate.

15. *Lycium californicum* Nutt.; A. Gray in Brewer & Wats. Bot. Calif. 1: 542. 1876.

Baja California. Southern California; type from San Diego.

Low, stiff shrub; leaves linear or nearly so, 1 cm. long or less, very fleshy; flowers short-pedicellate; corolla white, the limb with 4 rounded lobes.

16. *Lycium barbinodum* Miers, Ann. Mag. Nat. Hist. II. 14: 138. 1854.

Sonora and Sinaloa to Zacatecas and Coahuila.

Shrub, 1 to 2 meters high, with spinose branchlets; leaves linear-spatulate, mostly 1 cm. long or less, obtuse; corolla white. "Agrita" (Zacatecas).

17. *Lycium peninsulare* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 359. 1916.

Baja California; type from San José del Cabo.

Spiny glabrous shrub; leaves linear-spatulate to obovate, 2 cm. long or less, rounded or obtuse at apex; flowers on short or elongate pedicels.

Probably not distinct from *L. barbinode*.

7. **ACNISTUS** Schott, Wien. Zeitschr. 4: 1180. 1829.

Unarmed shrubs; leaves entire; pedicels solitary or fasciculate; calyx campanulate, truncate or 5-dentate, not accrescent; corolla tubular or funnel-form, 5-lobate, the lobes induplicate-valvate; stamens 5; fruit a globose 2-celled berry.

Corolla 12 mm. long-----1. **A. macrophyllum.**

Corolla 8 mm. long-----2. **A. pringlei.**

1. **Acnistus macrophyllum** (Benth.) Standl.

Lycium macrophyllum Benth. Pl. Hartw. 49. 1840.

Acnistus benthami Miers, Lond. Journ. Bot. 4: 342. 1845.

Michoacán; type from Morelia.

Leaves petiolate, oblong, about 10 cm. long, acute at base and apex, glabrous above, puberulent beneath; calyx cupuliform, 3 to 4 mm. long.

2. **Acnistus pringlei** Fernald, Proc. Amer. Acad. 40: 56. 1904.

Type from Valley of Zamora, Michoacán, altitude 1,500 meters.

Shrub, 3 to 4.5 meters high; leaves elliptic-lanceolate or lance-oblong 4 to 11 cm. long, acute, thinly tomentulose or glabrate beneath; calyx 2 to 3 mm. long, glabrous, the lobes obtuse; corolla glabrous; fruit about 7 mm. in diameter.

Probably not distinct from *A. macrophyllum*.

8. SOLANUM L. Sp. Pl. 184. 1753.

REFERENCES: Dunal in DC. Prodr. 13¹: 27-387. 1852; O. E. Schulz in Urban, Symb. Antill. 6: 149-249. 1909; Fernald, A revision of the Mexican and Central American Solanums of the subsection *Torvaria*, Proc. Amer. Acad. 35: 557-562. 1900.

Shrubs or herbs, sometimes scandent, the pubescence often of branched hairs; leaves entire, lobed, or pinnate; flowers usually cymose, racemose, or umbellate; calyx campanulate, 5-dentate or 5-lobate; corolla rotate, 5-angulate or 5-parted; filaments short, the anthers sometimes unequal, connate or connivent; fruit a globose berry.

Many herbaceous species occur in Mexico. Hemsley lists 139 species of *Solanum* from Mexico and Central America, but it is doubtful whether so many occur in the region. A rather large number of shrubby species are known to the writer only from Dunal's descriptions, and only a few of them have been placed in the following list. Many of them are based upon Pavón specimens which may have come from South America rather than Mexico.

The genus contains several species of economic importance, among which may be noted the potato, *Solanum tuberosum* L., native of the South American Andes, and the eggplant ("berenjena"), *Solanum melongena* L., a native of Asia and Africa.

A. Anthers short, the terminal pores usually anterior; plants never prickly. Flowers mostly axillary, the pedicels solitary or fasciculate.

Calyx 5-lobate.....1. *S. geminiflorum*.

Calyx with numerous (usually 10) lobes, or the lobes obsolete.

Pubescence of the leaves of simple hairs.

Calyx lobes obsolete.....2. *S. pringlei*.

Calyx lobes well developed.

Calyx hirsute with long hairs.....3. *S. amatitlanense*.

Calyx hirtellous with short subappressed hairs.

4. *S. nyctaginoides*.

Pubescence of branched hairs, or the leaves sometimes glabrous.

Pedicels and calyx hispid.....5. *S. purpusii*.

Pedicels and calyx glabrous or finely stellate-pubescent.

Leaves usually rounded or obtuse at apex, nearly or fully as broad as long, broadly rounded or subcordate at base...6. *S. lambii*.

Leaves acute to acuminate, much longer than broad or, if obtuse, acute at base.

Corolla 6 mm. long.....7. *S. sideroxyloides*.

Corolla over 1 cm. long.

Leaves densely and finely stellate-pubescent beneath.

8. *S. lentum*.

Leaves glabrous beneath or nearly so.

Leaves small, 5 cm. long or less.....9. *S. nocturnum*.

Leaves mostly 6 to 14 cm. long.

Leaves subcoriaceous, lustrous.....10. *S. chiapense*.

Leaves thin, dull.....11. *S. stephanocalyx*.

Flowers in cymes, racemes, or umbels, these all or mostly pedunculate.

B. Leaves pinnate or pinnate-lobate, or hastate-lobate, sometimes simple but the plants then scandent.

Leaves entire or hastate-lobate at base, or only the lower ones pinnatisect.

Leaves hastate-lobate at base.

Corolla 5-parted.....29. *S. triquetrum*.

Corolla 5-angulate.....30. *S. xanti*.

Leaves not hastate-lobate.

Anthers linear, about 3 times as long as broad; leaves glabrous beneath except along the costa.....12. *S. jasminoides*.

Anthers broadly oblong or oval, less than twice as long as broad; leaves short-villous beneath.....13. *S. macrantherum*.

Leaves all pinnate or pinnate-lobate.

Pubescence of fine branched hairs; lobes of the leaves obtuse.

14. *S. palmeri*.

Pubescence of simple hairs; leaf segments acute or acuminate.

Corolla about 5 mm. long.....15. *S. appendiculatum*.

Corolla about 10 mm. long.

Leaves glabrous beneath.....16. *S. seaforthianum*.

Leaves villosulous beneath.....17. *S. galeotti*.

BB. Leaves simple, entire or toothed, never hastate-lobate; plants commonly erect.

C. Mature leaves densely stellate-pubescent beneath over the whole surface.

Flowers in few-flowered lateral umbels.

Corolla lobes ascending.....18. *S. lignescens*.

Corolla lobes reflexed.

Hairs on the upper surface of the leaves mostly simple.

19. *S. plurifurciculum*.

Hairs on the upper surface of the leaves all branched.

20. *S. jaliscanum*.

Flowers in many-flowered cymes, these often terminal.

Younger branches with coarse, conspicuously stipitate, branched hairs.....21. *S. umbellatum*.

Younger branches with fine stellate hairs, these sessile or nearly so.

Leaves glabrous on the upper surface or nearly so, attenuate at base.....27. *S. cervantesii*.

Leaves densely stellate-pubescent on the upper surface or, if glabrate, obtuse or rounded at base.

Petioles very short, less than 1 cm. long; calyx shallowly and obtusely denticulate.....22. *S. salviifolium*.

Petioles usually more than 1 cm. long; calyx deeply dentate.

Ovary tomentose; leaves velutinous-tomentose on the upper surface.....23. *S. verbascifolium*.

Ovary glabrous; leaves stellate-scaberulous on the upper surface or glabrate.

Hairs on the lower surface of the leaf extremely minute, the leaves appearing glabrous.....24. *S. plumense*.

Hairs on the lower surface of the leaf conspicuous.

25. *S. bicolor*.

CC. Mature leaves glabrous beneath or nearly so, the pubescence, if any, chiefly along or near the costa, or the leaves sometimes rather densely pubescent with simple hairs.

Flowers in large many-flowered cymes, these chiefly terminal.

Branches winged.....26. *S. aligerum*.

Branches not winged.....27. *S. cervantesii*.

Flowers in few-flowered lateral umbels or racemes.

Pubescence of the leaves of simple hairs.

Corolla about 5 mm. long-----28. *S. nigrum*.

Corolla about 10 mm. long-----30. *S. xanti*.

Pubescence none or of branched hairs.

Young branchlets with a feltlike tomentum-----31. *S. brachystachys*.

Young branchlets glabrous or obscurely puberulent.

Leaves acuminate; pedicels usually recurved in fruit.

32. *S. nudum*.

Leaves mostly obtuse; pedicels erect in fruit-----33. *S. diphyllum*.

AA. Anthers more or less elongate, the terminal pores posterior or directed upward; plants nearly always armed with prickles.

D. Prickles of the stems strongly recurved; leaves not prickly on the upper surface.

Leaves glabrous on the upper surface, or pubescent with simple hairs.

Leaves entire-----34. *S. oaxacanum*.

Leaves all or mostly pinnate-lobate-----35. *S. refractum*.

Leaves sparsely or densely stellate-pubescent on the upper surface.

Branches glabrous or nearly so-----36. *S. houstonii*.

Branches copiously pubescent, the indument variable in character.

Prickles of the stems large, few, mostly 3 to 6 mm. long.

Leaves cuneate-decurrent at base, sessile or nearly so.

37. *S. jamaicense*.

Leaves not cuneate-decurrent at base, petiolate.

Leaves green beneath, sparsely stellate-hirsute.

38. *S. donnell-smithii*.

Leaves whitish-tomentose beneath-----39. *S. amictum*.

Prickles of the stems small, numerous, most of them 2 mm. long or less-----40. *S. lanceifolium*.

DD. Prickles straight or only slightly curved, or sometimes wanting, rarely recurved but the leaves then prickly on the upper surface.

Fruit densely hirsute.

Prickles of the stem glandular-puberulent-----41. *S. hirtum*.

Prickles not glandular-puberulent-----42. *S. tequilense*.

Fruit glabrous or nearly so.

Pubescence of the upper surface of the leaves chiefly of long simple hairs.

Calyx and pedicels not prickly-----43. *S. mammosum*.

Calyx and pedicels prickly.

Leaves sparsely hirsute on the upper surface, with few scattered stellate hairs beneath-----44. *S. aculeatissimum*.

Leaves densely pilose above, densely stellate-pubescent beneath.

35. *S. chloropetalum*.

Pubescence of the upper surface of the leaves chiefly of fine stellate hairs.

Calyx accrescent after anthesis, usually closely investing the fruit and nearly or quite equaling it.

Leaves all entire-----46. *S. hindsianum*.

Leaves, at least most of them, undulate or lobate.

Shorter anthers 1.5 cm. long or more; leaves lobed nearly to the costa-----47. *S. azureum*.

Shorter anthers 1 cm. long or less; leaves usually shallowly lobate-----48. *S. amazonium*.

Calyx slightly if at all accrescent, much shorter than the fruit, usually spreading.

Fruit 3 cm. in diameter or larger-----49. *S. marginatum*.

Fruit usually less than 2 cm. in diameter.

Stems bristly-hispid, each bristle with a tuft of hairs at apex.

50. *S. hispidum*.

Stems not hispid.

Pubescence of the pedicels partly of gland-tipped hairs.

Leaves deeply lobate-----51. *S. hernandesii*.

Leaves shallowly lobate or entire.

Pedicels erect in fruit-----52. *S. torvum*.

Pedicels reflexed in fruit-----53. *S. madrense*.

Pubescence of the pedicels eglandular.

Anthers 8 to 10 mm. long-----54. *S. mitlense*.

Anthers about 5 mm. long.

Leaves acute to attenuate at base, entire.

55. *S. laurifolium*.

Leaves usually obtuse to subcordate at base, most of them undulate or sinuate-lobate-----56. *S. diversifolium*.

1. *Solanum geminiflorum* Mart. & Gal. Bull. Acad. Brux. 12¹: 142. 1845.

Type from Chinantla, Oaxaca.

Glabrous shrub; leaves ovate-lanceolate, 7 to 10 cm. long, acuminate, attenuate at base, entire; pedicels geminate; flowers white, 6 mm. long.

Solanum hookerianum Spreng., listed by Hemsley, is a synonym of *S. havanense* Jacq., and is not known from Mexico.

2. *Solanum pringlei* Robins. & Greenm. Amer. Journ. Sci. 50: 160. 1895.

Jalisco and Michoacán; type from Lake Chapala, Jalisco.

Plants suffrutescent, about 2 meters high, the branches viscid-villous; leaves broadly ovate, 5 to 12 cm. long, long-acuminate, broadly rounded and short-decurrent at base, short-villous; pedicels geminate, recurved in fruit; corolla nearly 1.5 cm. long; fruit bright red, 1.5 cm. long, glabrous.

3. *Solanum amatitlanense* Coult. & Donn. Smith, Bot. Gaz. 37: 420. 1904.

Chiapas. Guatemala; type from Amatitlán.

Shrub, the branches hirsute with forked hairs; leaves on very short petioles, oblong-lanceolate or elliptic-oblong, 20 cm. long or less, long-acuminate, obtuse or acute at base and very unequal, entire, hirsute; pedicels fasciculate.

The writer has seen no material of *S. sylvicola* T. S. Brandeg.,¹ described from Finca Irlanda, Chiapas, which may be a synonym of this species.

4. *Solanum nyctaginoides* Dunal in DC. Prodr. 13¹: 172. 1852.

Hidalgo and probably elsewhere; described from somewhere in Mexico.

Slender shrub, 3 to 4.5 meters high, the branches hirtellous; leaves slender-petiolate, lanceolate to ovate-elliptic, 13 cm. long or less, long-acuminate, attenuate at base, pilose-hirsute, entire; pedicels fasciculate; corolla 10 to 14 mm. long; fruit globose, orange.

5. *Solanum purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 62. 1914.

Type from Finca Mexiquito, Chiapas.

Slender shrub, the branches hirsute with branched hairs; leaves short-petiolate, oblong-ovate, 12 cm. long or less, acuminate, rounded at base, entire, sparsely hirsute above, sparsely stellate-pubescent beneath; pedicels solitary or geminate; calyx lobes in fruit sometimes 1.5 cm. long; fruit 1.5 cm. in diameter.

¹ Univ. Calif. Publ. Bot. 6: 373. 1917.

6. *Solanum lambii* Fernald, Bot. Gaz. 20: 536. 1895.

Sinaloa and Jalisco; type from Villa Unión, Sinaloa.

Woody vine, the branches stellate-pubescent; leaves slender-petiolate, rounded-ovate, 4 cm. long or less, entire, finely stellate-pubescent or rarely glabrate; pedicels geminate or fasciculate; corolla bluish, 1.5 cm. long; fruit 5 to 6 mm. in diameter, glabrous.

7. *Solanum sideroxyloides* Schlecht. Linnaea 8: 253. 1833.

Type from Hacienda de la Laguna, Veracruz.

Shrub, the branches stellate-tomentose; leaves petiolate, ovate or oblong-ovate, 7 cm. long or less, acute or short-acuminate, obtuse at base, entire, brownish-tomentose beneath; pedicels fasciculate; corolla white; fruit glabrous.

8. *Solanum lentum* Cav. Icon. Pl. 4: 4. pl. 308. 1797.

Solanum stellatum lentum O. E. Schulz in Urban, Symb. Antill. 6: 189. 1909.

Tamaulipas, Veracruz, and Oaxaca. Cuba, Guatemala, and El Salvador.

Shrub, trailing or scandent, sometimes 3 meters long, the branches densely stellate-pubescent; leaves ovate or oblong-ovate, 6.5 cm. long or less, entire, obtuse or rounded at base; pedicels usually fasciculate; corolla usually violet, 14 to 18 mm. long; fruit red, 6 to 8 mm. in diameter, glabrous. "Quesillo," "manzana montés," "guaco" (El Salvador).

Closely related to *S. virgatum* Lam., a West Indian species, and perhaps not distinct.

9. *Solanum nocturnum* Fernald, Proc. Amer. Acad. 35: 570. 1900.

Guerrero and Oaxaca; type from Acapulco.

Woody vine, the branches minutely stellate-pubescent or glabrate; leaves slender-petiolate, acute or obtuse, entire, finely and sparsely stellate-pubescent when young but soon glabrous; pedicels solitary or geminate; corolla 12 to 15 mm. long; fruit 1 cm. in diameter.

10. *Solanum chiapense* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 192. 1915.

Type from Finca Irlanda, Chiapas.

Shrub, glabrous throughout, probably scandent; leaves on very short petioles, elliptic or lance-oblong, 10 cm. long or less, narrowed to the obtuse or acutish apex, obtuse or subacute at base, entire; pedicels solitary or geminate; anthers unequal.

11. *Solanum stephanocalyx* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 374. 1917.

Veracruz; type from Zacuapan.

Plants slender, herbaceous or fruticose, the branches puberulent or nearly glabrous; leaves petiolate, ovate or elliptic-ovate, 14 cm. long or less, acute to rounded at base, entire, puberulent beneath along the veins or glabrous; pedicels solitary or geminate; corolla 12 to 18 mm. long.

12. *Solanum jasminoides* Paxton, Mag. Bot. 8: pl. 5. 1841.

Morelos and Veracruz, naturalized; cultivated about the City of Mexico. Native of Brazil.

Plants scandent, suffrutescent, puberulent or glabrous; leaves slender-petiolate, triangular-ovate, 5 cm. long or less, narrowed to the obtuse or acute apex, rounded to subcordate at base, entire, glabrous or nearly so, the lower leaves usually parted or cleft; flowers slender-pedicellate, in large cymes; corolla white or bluish, nearly 2 cm. broad. "Flor de San Diego" (Veracruz).

13. *Solanum macrantherum* Dunal, Sol. Syn. 16. 1816.

Michoacán and Guanajuato to Veracruz and Chiapas.

Scandent shrub, the branches villosulous; leaves long-petiolate, ovate to broadly ovate, 13 cm. long or less, acuminate, rounded or truncate at base, entire, puberulent or short-villous beneath or sometimes glabrate; cymes large, many-flowered; corolla violaceous, 2 to 4 cm. broad; flowers sweet-scented; fruit red, about 1 cm. or less in diameter.

Solanum boldoense A. DC., described from Cuba, is a closely related species and perhaps not distinct. It has been reported from Mexico.

14. *Solanum palmeri* Vasey & Rose, Proc. U. S. Nat. Mus. 11: 532. 1889.

Baja California and the adjacent islands; type from San Quentín Bay.

Plants suffrutescent, minutely pubescent with branched hairs; leaves nearly all lobate, usually 3-lobate, the lower lobes sometimes very small or suppressed; flowers in few-flowered umbels; corolla violaceous, 1.5 cm. broad.

15. *Solanum appendiculatum* Dunal, Sol. Syn. 5. 1816.

High mountains, Mexico, Veracruz, and Oaxaca; type from Puente de la Madre de Dios. Guatemala.

Slender shrub, scandent to a height of 9 meters, the branches puberulent or glabrate; leaflets 3 or 5, lance-oblong to ovate, 5 cm. long or less, acuminate, acute at base, entire, very sparsely short-hirsute above, puberulent beneath along the veins; cymes small, few-flowered; corolla white; fruit 6 to 8 mm. in diameter.

16. *Solanum seaforthianum* Andrews, Bot. Rep. 8: pl. 504. 1797-1804.

Specimens seen from Baja California, Tamaulipas, Michoacán or Guerrero (?), and Yucatán, most of them probably from cultivated plants. West Indies, Central America, and northern South America.

Scandent shrub, 2 to 6 meters long, the branches sparsely puberulent or glabrate; leaflets 3 or 5, oblong-lanceolate to ovate, 8 cm. long or less, entire, the upper ones decurrent upon the petiole, glabrous or nearly so; cymes usually large and many-flowered; corolla violaceous, nearly 1 cm. long; fruit red, 6 to 9 mm. in diameter. "Piocha" (Yucatán); "guinda," "falsa belladonna," "jazmín de Italia" (Porto Rico); "Josefina," "dulceamarga" (El Salvador).

This is probably the plant reported from Mexico by various writers as *S. dulcamara* L., and said to be known as "gloria" and "guía de jazmincillo." It is a handsome vine and is commonly cultivated in Mexico and Central America.

17. *Solanum galeotti* Dunal in DC. Prodr. 13¹: 82. 1852.

Type from Ario, Michoacán.

Scandent shrub; leaves long-petiolate, 5-parted, the segments ovate-oblong, 7 cm. long or less, acutish; corolla white.

Solanum stephanodes Schlecht.,¹ described from Cumbre del Obispo, appears, from the description, to be closely related.

18. *Solanum lignescens* Fernald, Proc. Amer. Acad. 33: 91. 1897.

Guerrero to Chiapas; type from Acapulco, Guerrero.

Shrub, the branches closely stellate-pubescent; leaves petiolate, ovate or elliptic, 7 cm. long or less, obtuse or acute, closely stellate-pubescent; umbels short-pedunculate; corolla white, 1.5 cm. broad; fruit glabrous, 1 cm. in diameter.

¹ *Linnaea* 19: 290. 1846.

19. *Solanum plurifurcipes* Bitter, Repert. Sp. Nov. Fedde 11: 15. 1912.

Type from Pacho Forest, near Jalapa, Veracruz, altitude 1,200 meters.

Shrub, 0.5 to 1 meter high, the stems pubescent with coarse branched hairs; leaves short-petiolate, ovate-oblong or ovate, 7.5 cm. long or less, acute, short-decurrent at base, entire; umbels short-pedunculate; corolla white, about 1 cm. broad.

The description of *S. ulmoides* Dunal¹ is strongly suggestive of this plant.

20. *Solanum jaliscanum* Greenm. Proc. Amer. Acad. 34: 571. 1899.

Barranca near Guadalajara, Jalisco, altitude 1,200 meters, the type locality.

Shrub, the branches stellate-pubescent; leaves ovate-oblong or lance-oblong, 13 cm. long or less, acute or obtuse, acute at base, entire, finely stellate-pubescent; umbels short-pedunculate; corolla about 1 cm. broad; fruit 1 cm. in diameter, glabrous.

21. *Solanum umbellatum* Mill. Gard. Dict. ed. 8. *Solanum* no. 27. 1768.

Solanum granuloso-leprosum Dunal in DC. Prodr. 13¹: 115. 1852.

Solanum cortex-virens Dunal in DC. Prodr. 13¹: 372. 1852.

Solanum receptum Heurck & Muell. Arg.; Heurck, Obs. Bot. 1: 46. 1870.

Sonora to Tamaulipas, Veracruz, and Oaxaca. West Indies and Central America.

Shrub or small tree, 1 to 6 meters high; leaves oblong-elliptic to oblanceolate, 20 cm. long or less, acuminate, long-attenuate at base, finely stellate-pubescent above, green, beneath pubescent with branched, chiefly stipitate hairs; cymes dense, many-flowered, long-pedunculate; corolla white, 7 to 9 mm. long; fruit yellow, 1 to 1.5 cm. in diameter. "Berenjena" (Sinaloa); "cazaniche" (Villada); "friega-plato" (Nicaragua); "prendedera macho" (Cuba); "tapalayote" (El Salvador).

The specimens which belong here have nearly always been referred to *S. callicarpifolium* Kunth & Bouché.

22. *Solanum salviifolium* Lam. Tabl. Encycl. 2: 14. 1793.

Solanum geminifolium ("geminiflorum") Schlecht. Linnaea 5: 112. 1830.

Solanum schlechtendalianum Walp. Repert. Bot. 3: 61. 1844-45.

Michoacán or Guerrero to Chiapas, Tabasco, and Veracruz. West Indies and Central America.

Shrub or small tree, 2 to 4.5 meters high, the branches densely stellate-tomentose; leaves often subsessile, lance-oblong to broadly ovate, 15 cm. long or less, acuminate, rounded or subcordate at base, green above, usually glabrate, densely and finely stellate-tomentose beneath with whitish hairs; cymes long-pedunculate, becoming lateral; corolla white, 7 mm. long or less; fruit 7 mm. in diameter, glabrate.

23. *Solanum verbascifolium* L. Sp. Pl. 184. 1753.

Nearly throughout Mexico except Baja California. Southern Florida; Central America; Old World tropics.

Shrub or small tree, 2 to 10 meters high, the branches finely stellate-tomentose; leaves petiolate, ovate to lanceolate, 25 cm. long or less, acute or acuminate, rounded at base or decurrent, entire, velvety-tomentose on both surfaces; cymes long-pedunculate; corolla white, 7 to 9 mm. long; fruit yellowish, 6 to 12 mm. in diameter. "Salvadora" (Tamaulipas); "saca-manteca" (Sinaloa); "guardolobo" (Nuevo León); "xtuhuy," "tom-paap," "xaxox" (Yucatán, Maya); "zoza" or "sosa" (Morelos, Veracruz, San Luis Potosí); "hierba de San Pedro" (Nuevo León); "hoja de manteca" (Conzatti);

¹In DC. Prodr. 13¹: 130. 1852.

"galantea" (Oaxaca, *Reko*); "friega-plato," "berenjena" (Veracruz); "tabaco cimarrón," "prendedera hedionda," "prendedera macho," "pendejera macho" (Cuba); "berenjena de paloma," "berenjena cimarrona," "tabacón pelado" (Porto Rico); "tapalayote" (El Salvador).

The soft velvet-like leaves are used for cleaning dishes. They are also heated and applied to the forehead to relieve headache, and applied as poultices to ulcers and boils.

24. *Solanum plumense* Fernald, Proc. Amer. Acad. 35: 569. 1900.

Type from Pluma, Oaxaca.

Shrub, the branches very minutely stellate-puberulent; leaves ovate-lanceolate, 10 to 18 cm. long, long-acuminate, acutish to rounded at base, entire; cymes long-pedunculate; corolla white, 1.5 cm. broad; fruit 1 cm. in diameter.

25. *Solanum bicolor* Willd.; Roem. & Schult. Syst. Veg. 4: 661. 1819.

Solanum callicarpifolium Kunth & Bouché, Ind. Sem. Hort. Berol. 10. 1845.

Sinaloa to Chiapas and Yucatán. Lesser Antilles, Central America, and northern South America.

Shrub, 1.5 to 3 meters high, the branches finely stellate-pubescent; leaves elliptic to oblong-oblong-lanceolate, usually 10 to 30 cm. long, acute or short-acuminate, decurrent at base, entire, green above; cymes long-pedunculate; corolla white, about 7 mm. long; fruit 6 to 8 mm. in diameter, yellow. "Saca-man-teca" (Sinaloa).

26. *Solanum aligerum* Schlecht. Linnaea 19: 301. 1846.

Michoacán, Mexico, Hidalgo, and Veracruz; type from Anganguero, Michoacán.

Shrub or small tree; leaves short-petiolate, oblong-lanceolate, 16 cm. long or less, acute at base, entire, glabrous above, barbate beneath along the costa or when young loosely tomentose with branched hairs; panicles pedunculate, lax; corolla white, 6 mm. long; fruit glabrous, 1 cm. in diameter.

27. *Solanum cervantesii* Lag. Nov. Gen. & Sp. 10. 1816.

Solanum pubigerum Dunal, Sol. Syn. 160. pl. 6. 1816.

San Luis Potosí and Guanajuato to Chiapas and Veracruz. Guatemala.

Shrub, 1 to 4.5 meters high, the branches puberulent or glabrous; leaves long-petiolate, lanceolate to oblong-elliptic, 24 cm. long or less, acute or acuminate, acute or decurrent at base, usually more or less pubescent beneath but often glabrous; cymes long-pedunculate; corolla white, 5 to 7 mm. long; fruit black, 5 to 7 mm. in diameter. "Hierba del perro" (San Luis Potosí).

The fruit is said to be eaten by children and to be harmless.

28. *Solanum nigrum* L. Sp. Pl. 186. 1753.

Solanum americanum Mill. Gard. Dict. ed. 8. *Solanum* no. 5. 1768.

Solanum oligospermum Bitter, Repert. Sp. Nov. Fedde 12: 80. 1913.

Nearly throughout Mexico. Widely distributed in tropical and temperate regions of both hemispheres.

Usually herbaceous but sometimes woody and as much as 3 meters high, the branches puberulent or villosulous; leaves long-petiolate, mostly ovate, 10 cm. long or less, acute or acuminate, obtuse or rounded at base, sinuate-dentate or frequently entire; umbels slender-pedunculate; corolla white or bluish, 2 to 4 mm. long; fruit 5 to 7 mm. in diameter, black. "Mora" (Jalisco, etc.); "chuchilitas" (Sonora); "tohonchichi" (Oaxaca); "hierba mora" (Tamaulipas, Durango, San Luis Potosí, Oaxaca, Sonora, Cuba, Porto Rico, El Salvador,

Costa Rica, Peru, Colombia); "chichiquelite" (Durango); "tzopilotlaquatl" (Ramírez); "thucupache xaqua" (Michoacán, Tarascan, León); "bitaxe" (Oaxaca, Zapotec, Reko); "mata-gallinas" (Porto Rico).

Black nightshade is a common weed in Mexico as well as in the United States. The berries are commonly believed to be poisonous and there is little doubt that they are in some instances, but some forms of the plant have been introduced into cultivation under the names "wonderberry" and "garden huckleberry," and their fruit is quite harmless and highly valued by many persons, especially for making pies. In Mexico and Central America the young shoots and leaves are commonly cooked as a pot herb, and the same practice is followed in Mauritius, Madagascar, and other countries. In Sinaloa the root is said to have been employed as a remedy for bubonic plague. Elsewhere in Mexico the fruit is a domestic remedy for erysipelas, and a decoction of the plant is employed as a fomentation for sore eyes and for various skin diseases. The leaves are sometimes applied as poultices to allay pain. In Europe the plant is generally reputed to have narcotic properties, and in Bohemia the leaves are placed in the cradles of infants to promote sleep.

Solanum nigrum is a somewhat variable plant, and many of the forms (including several from Mexico) have been described as distinct species.

29. *Solanum triquetrum* Cav. Icon. Pl. 3: 30. pl. 259. 1794.

Coahuila, Nuevo León, and San Luis Potosí. Western Texas.

Plants erect or subsucculent, a meter high or less, suffrutescent, nearly glabrous; leaves 5 cm. long or less, most of them triangular-hastate or lance-hastate, acute or acuminate; cymes umbelliform, few-flowered; corolla white or violet; fruit red, about 1 cm. in diameter.

30. *Solanum xanti* A. Gray, Proc. Amer. Acad. 11: 90. 1876.

Northern Baja California. California; type from Fort Tejon.

Plants suffrutescent, the stems viscid-pubescent; leaves lanceolate to ovate, 1 to 4 cm. long, obtuse, entire or sometimes auriculate-lobate at base, viscid-pubescent; corolla blue or violet, about 2 cm. broad; fruit purplish black.

31. *Solanum brachystachys* Dunal in DC. Prodr. 13¹: 128. 1852.

Solanum lucidum Mart. & Gal. Bull. Acad. Brux. 12¹: 137. 1845. Not *S. lucidum* Moric. 1830.

Solanum venosum Sendtn. in Mart. Fl. Bras. 10: 29. 1846. Not *S. venosum* Humb. & Bonpl. 1819.

Mexico, Oaxaca, and Chiapas; type from Chalco, Mexico. Guatemala.

Shrub; leaves petiolate, lanceolate to elliptic, 6 to 9 cm. long, short-acuminate or acute, obtuse or acute at base, glabrous above, glabrous beneath or when young with a loose feltlike tomentum; corolla 8 to 10 mm. broad; fruit glabrous, about 1 cm. in diameter.

Solanum nigricans Mart. & Gal.,¹ described from Oaxaca, is a closely related plant and perhaps not distinct.

32. *Solanum nudum* H. B. K. Nov. Gen. & Sp. 3: 33. 1818.

Michoacán to Veracruz and Chiapas; type from Jalapa, Veracruz. Central America.

Shrub, 2 to 4.5 meters high, the branches glabrous; leaves oblong-lanceolate to elliptic, 15 cm. long or less, acute at base, usually barbate beneath along the costa; corolla white, 4 to 6 mm. long; fruit about 1 cm. in diameter.

The Mexican specimens have usually been referred to *S. triste* Jacq.

¹Bull Acad. Brux. 12¹: 134. 1845.

33. *Solanum diphyllum* L. Sp. Pl. 184. 1753.

Tepic to Tamaulipas, Veracruz, and Oaxaca. Guatemala and El Salvador.

Shrub, 1 to 1.5 meters high, the branches glabrous or obscurely puberulent; leaves petiolate, lanceolate to oblong-elliptic, 12 cm. long or less, acute or attenuate at base, lustrous, glabrous beneath; corolla white, 3 to 4 mm. long; fruit 6 to 7 mm. in diameter. "Amatillo," "hoja del golpe" (El Salvador).

34. *Solanum oaxacanum* Dunal in DC. Prodr. 13¹: 204. 1852.

Solanum hamatile T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 192. 1915.

Oaxaca and Chiapas; type from Tehuantepec, Oaxaca.

Shrub, glabrous throughout, the branches armed with short remote recurved prickles; leaves long-petiolate, oblong-lanceolate to ovate-elliptic, 8 cm. long or less, acute, decurrent at base, thin, paler beneath and sometimes prickly along the costa; inflorescence few-flowered, the flowers long-pedicellate; corolla about 1 cm. long.

35. *Solanum refractum* Hook. & Arn. Bot. Beechey Voy. 304. 1839-40.

Sinaloa to Jalisco and Morelos; type from Tepic.

Shrub, usually scandent, the branches densely prickly; leaves mostly oblanceolate or obovate, 30 cm. long or less, obtuse to acuminate, long-attenuate to the base, sessile or nearly so, entire or usually lobate, prickly beneath, glabrous or pilose; flowers racemose-cymose, the inflorescences lax, many-flowered; corolla 12 mm. long, white; fruit about 5 cm. in diameter. "Toronja" (Sinaloa).

36. *Solanum houstoni* Dunal, Hist. Sol. 243. 1813.

Solanum tampicense Dunal in DC. Prodr. 13¹: 284. 1852.

Tamaulipas and Veracruz; type from Veracruz. Cuba; El Salvador.

Shrub, 1 to 2 meters high, the branches armed with stout recurved prickles; leaves petiolate, oblong or oblong-ovate, 13 cm. long or less, obtuse or acute, cuneate at base, irregularly lobate, sparsely stellate-pubescent; flowers in axillary umbels or racemes; corolla white, 6 to 11 mm. long; fruit red, 6 to 7 mm. in diameter, glabrous. "Ajicón" (Cuba); "huistomate," "huevo de gato" (El Salvador).

37. *Solanum jamaicense* Mill. Gard. Dict. ed. 8. *Solanum* no. 17. 1768.

Solanum cuneifolium Dunal, Hist. Sol. 193. *pl.* 22. 1813.

Oaxaca. West Indies; Central and South America; type from Jamaica.

Shrub, often scandent, the branches densely tomentose with chiefly stipitate, stellate hairs; leaves broadly ovate or elliptic, 25 cm. long or less, acute, angulate-lobate, densely tomentose with coarse stipitate stellate hairs, often prickly beneath; inflorescences lateral, few-flowered; corolla white, 8 mm. long; fruit orange, 4 to 6 mm. in diameter. "Berenjena" (Porto Rico).

38. *Solanum donnell-smithii* Coult. Bot. Gaz. 16: 144. 1891.

Veracruz, Oaxaca, and Chiapas. Central America; type from Escuintla, Guatemala.

Erect or scandent shrub, the branches hispid with coarse long-stipitate stellate hairs; leaves oblong to ovate, 16 cm. long or less, acute, usually obtuse at base, entire, lobate, or sinuate, usually prickly beneath; cymes few-flowered, lateral; calyx prickly; corolla 1.5 cm. long, parted nearly to the base, white; fruit glabrous, nearly 1 cm. in diameter. "Huistomate" (El Salvador).

39. *Solanum amictum* Moric.; Dunal in DC. Prodr. 13¹: 263. 1852.

Veracruz and perhaps elsewhere; type from Cordillera of Guichilaca.

Branches stellate-hirsute; leaves ovate-lanceolate, 20 cm. long or less, acuminate, sinuate-repand, stellate-pilose above; cymes lateral, many-flowered; calyx hirsute; fruit 6 mm. in diameter.

This species may not be correctly placed in the key. It is known to the writer only from description.

40. *Solanum lanceifolium* Jacq. Coll. Bot. 2: 286. 1788.

Tamaulipas, San Luis Potosí, and Veracruz. West Indies, Central America, and northern South America.

Shrub, usually scandent, the branches stellate-pubescent; leaves petiolate, ovate to oblong, 15 cm. long or less, acute or obtuse, acute to rounded at base, sparsely stellate-pubescent above, densely so beneath and usually prickly; inflorescences lateral, few-flowered, racemiform; corolla white, 9 to 12 mm. long; fruit red, 6 to 9 mm. in diameter.

41. *Solanum hirtum* Vahl, Symb. Bot. 2: 40. 1791.

Solanum flavescens Dunal; Poir. Encycl. Suppl. 3: 778. 1813.

Solanum molestum T. S. Brandeg. Univ. Calif. Publ. Bot. 7: 331. 1920.

Veracruz and Yucatán. Guatemala; West Indies and northern South America.

Shrub, 2.5 meters high or less, the branches stellate-tomentose, densely prickly; leaves broadly ovate to suborbicular, 20 cm. long or less, acute or obtuse, cordate at base, sinuate-lobate, prickly, at least beneath, densely stellate-tomentose beneath; inflorescences lateral, 2 to 8-flowered; calyx 1 cm. long, deeply parted, the lobes obtuse or acutish; corolla white, 1.5 cm. long; fruit about 2 cm. in diameter, yellow, covered with long yellow hairs.

42. *Solanum tequilense* A. Gray, Proc. Amer. Acad. 22: 441. 1887.

Solanum huitlanum T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 192. 1915.

Tepec to Chiapas; type from Tequila, Jalisco. Guatemala.

Erect shrub, the branches stellate-tomentose, densely covered with long stout prickles; leaves oval to rounded-ovate, 40 cm. long or less, obtuse or acute, rounded or subcordate at base, densely stellate-tomentose, sinuate-repand, usually prickly on both surfaces, the prickles sometimes 3 cm. long; inflorescences few-flowered; fruit 2.5 to 3.5 cm. in diameter.

43. *Solanum mammosum* L. Sp. Pl. 187. 1753.

Reported from Veracruz by Hemsley, but perhaps erroneously; reported from Mexico by O. E. Schulz.¹ West Indies; Central and South America.

Plants herbaceous or suffrutescent, 1.5 meters high or less, densely pilose with long articulate hairs; leaves nearly as broad as long, 10 to 15 cm. long, shallowly cordate at base, irregularly lobate, the lobes obtuse or acute, usually armed on both surfaces with long stout prickles; inflorescences umbelliform, lateral, 1 to 6-flowered; corolla violaceous, about 2 cm. long; fruit 3 to 4.5 cm. in diameter, orange. "Berenjena" (Veracruz); "berenjenita peluda" (Tabasco, *Roviroso*); "pichichfo" (Costa Rica); "uña de gato" (Panama); "chichimora" (El Salvador); "chichihua" (Honduras); "chichigua," "chichita," "marimbita amarilla," "chichona" (Nicaragua); "rejalgar" (Colombia); "berenjena cimarrona," "berenjena de marimbo" (Porto Rico); "güirito" (Cuba); "chicha" (Guatemala).

The fruit is said to be very poisonous. In Costa Rica a decoction of the leaves is employed as a remedy for diseases of the kidneys and bladder. In El Salvador the seeds are said to be used as a remedy for colds.

44. *Solanum aculeatissimum* Jacq. Icon. Pl. Rar. 5. pl. 41. 1781-86.

Veracruz. Florida, West Indies, Central and South America; also in the Old World tropics.

¹ In Urban, Symb. Antill. 6: 206. 1909.

Plants suffrutescent, often procumbent, the branches densely covered with long prickles; leaves broadly ovate, 15 cm. long or less, acute, usually subcordate at base, lobate, the lobes acute or obtuse; inflorescences umbelliform, 2 to 5-flowered; corolla white, 1 to 1.5 cm. long; fruit orange, 2 to 3 cm. in diameter. "Berenjena" (Costa Rica).

45. *Solanum chloropetalum* Schlecht. *Linnaea* 19: 291. 1847.

?*Solanum porphyranthum* Dunal in DC. *Prodr.* 13¹: 244. 1852.

Hidalgo and Veracruz; type from Jalapa, Veracruz. Guatemala.

Plants suffrutescent, the branches armed with long, straight or sometimes curved prickles; leaves rounded-ovate, long-petiolate, 16 cm. long or less, acute or obtuse, cordate at base, shallowly sinuate-lobate, armed with stout prickles on both surfaces; inflorescences few-flowered; corolla greenish white, 1 to 1.5 cm. long; fruit yellow.

Solanum globiferum Dunal, a West Indian plant, reported from Mexico by Schulz, is probably not distinct.

46. *Solanum hindsianum* Benth. *Bot. Voy. Sulph.* 39. 1844.

Baja California and Sonora; type from Magdalena Bay, Baja California.

Shrub, 1 to 3 meters high, the branches finely stellate-tomentose, usually armed with long prickles; leaves petiolate, ovate to oblong, 4.5 cm. long or less, obtuse, rounded or subcordate at base, sometimes prickly beneath, covered with a dense close tomentum; inflorescence umbelliform, few-flowered; corolla light or dark violet, about 4 cm. broad; fruit about 1 cm. in diameter. "Mariola" (Baja California).

The plant is said to be employed in Baja California as an emmenagogue.

47. *Solanum azureum* Fernald, *Proc. Amer. Acad.* 35: 570. 1900.

Sinaloa; type from Topolobampo.

Shrub, the branches finely stellate-pubescent, armed with few slender prickles; leaves with numerous obtuse lobes, often prickly beneath, finely stellate-pubescent; peduncles with 10 or fewer flowers; corolla 4 to 5 cm. broad, violet; fruit 12 mm. in diameter.

48. *Solanum amazonium* Ker in Edwards, *Bot. Reg. pl.* 71. 1815.

Solanum obtusifolium Schlecht. *Linnaea* 5: 113. 1830. Not *S. obtusifolium* Dunal, 1813.

Solanum verae-crucis Steud. *Nom. Bot. ed. 2.* 2: 607. 1841.

Sonora and Chihuahua to Zacatecas, Oaxaca, Campeche, and Yucatán.

Shrub, the branches closely stellate-pubescent, usually armed with slender prickles; leaves ovate to oblong, 14 cm. long or less, obtuse or acute, obtuse to subcordate at base, sinuate or sinuate-lobate, sometimes entire, densely stellate-tomentose beneath and often prickly; inflorescences few-flowered; corolla blue or violet, commonly 4 to 5 cm. broad; fruit about 1.5 cm. in diameter. "Berenjena silvestre," "saca-manteca" (Sinaloa); "xkon-yakik" (Yucatán, Maya).

49. *Solanum marginatum* L. f. *Suppl. Pl.* 147. 1781.

Naturalized in the Valley of Mexico. Native of northeastern Africa.

Plants suffrutescent, 1 to 1.5 meters high, the branches white-tomentose, prickly; leaves oval or broadly ovate, 25 cm. long or less, obtuse, shallowly sinuate-lobate, armed with prickles, green and glabrate above, white-tomentose beneath; calyx prickly; corolla white, 2.5 cm. broad; fruit yellow, glabrous.

50. *Solanum hispidum* Pers. *Syn. Pl.* 1: 228. 1805.

Solanum chrysotrichum Schlecht. *Linnaea* 19: 304. 1847.

Michoacán to Veracruz and Chiapas. Guatemala; Peru (?).

Shrub, 4 meters high or less, the branches armed with short stout prickles; leaves ovate-oblong to broadly ovate, 20 cm. long or less, acute, obtuse to subcordate at base, subentire or usually lobate, often prickly, densely stellate-tomentose beneath, some of the hairs stipitate; corolla whitish, 12 to 15 mm. long; fruit 1 to 1.5 cm. in diameter. "Sosa" (Michoacán, Guerrero).

51. *Solanum hernandesii* Moc. & Sessé; Dunal in DC. Prodr. 13¹: 266. 1852. Chiapas. Guatemala to Nicaragua.

Shrub, the branches fulvous-tomentose, armed with stout prickles; leaves 13 cm. long or less, truncate or subcordate at base, prickly, 5 to 7-lobate, the lobes often again lobate, stellate-tomentose; inflorescences few or many-flowered; corolla white, 10 to 13 mm. long; fruit 1 cm. in diameter. "Huistomate," "güistomate" (El Salvador).

52. *Solanum torvum* Swartz, Prodr. Veg. Ind. Occ. 47. 1788.

Solanum ferrugineum Jacq. Pl. Hort. Schönbr. 3: 46. pl. 334. 1798.

Veracruz and Chiapas. Florida, West Indies, Central America, and northern South America; also in the Old World tropics.

Shrub, 1 to 4 meters high, the branches stellate-pubescent, armed with short prickles; leaves broadly ovate, 20 cm. long or less, acute or acuminate, usually rounded or subcordate at base, sinuate-lobate, stellate-tomentose, often prickly; cymes few to many-flowered; corolla white, 10 to 12 mm. long; fruit 1 to 1.5 cm. in diameter, yellow. "Tomatillo" (Guatemala); "berenjena" (Costa Rica); "berenjena cimarrona" (Costa Rica, Porto Rico); "pendejera," "prendera" (Cuba); "friegas-platos" (Colombia).

The names "espina" (Yucatán), "friegas-platos" (San Luis Potosí), and "conoca" (Jalisco) are reported for this species, but they probably relate to other species.

53. *Solanum madrense* Fernald, Proc. Amer. Acad. 35: 558. 1900.

Sonora and Chihuahua to Morelos and Oaxaca; type from Sierra de Alamos, Sonora. Central America.

Shrub, 1 to 4.5 meters high, the branches fulvous-tomentose, armed with short stout prickles; leaves ovate or broadly ovate, 18 cm. long or less, acute or obtuse, usually subcordate at base, subentire to sinuate-lobate, densely stellate-tomentose beneath, often prickly; inflorescence few or many-flowered; corolla 1.5 to 2 cm. long, white; fruit 1 to 1.5 cm. in diameter. "Berenjena" (Durango); "huistomate," "güistomate," "güis," "lava-platos" (El Salvador).

54. *Solanum mitlense* Dunal in DC. Prodr. 13¹: 314. 1852.

Guerrero and Oaxaca; type from Mitla, Oaxaca. Guatemala.

Shrub or small tree, 3 to 4.5 meters high, the branches densely and coarsely tomentose, armed with short prickles; leaves lanceolate to broadly ovate, 25 cm. long or less, obtuse to acuminate, acute to subcordate at base, shallowly sinuate-lobate, densely and loosely tomentose on both surfaces; cymes dense, many-flowered; corolla violet, 3 cm. broad; fruit 1 to 1.5 cm. broad. "Coyotomatl" (Puebla).

55. *Solanum laurifolium* Mill. Gard. Dict. ed. 8. *Solanum* no. 20. 1768.

Solanum lanceolatum Cav. Icon. Pl. 3: 23. pl. 245. 1794.

Solanum cymosum Ortega, Hort. Matr. Dec. 1: 11. 1797.

Solanum macrophyllum Dunal, Hist. Sol. 199. pl. 17. 1813.

Solanum mexicanum Moc. & Sessé; Dunal in Poir. Encycl. Suppl. 3: 770. 1813.

Solanum hartwegii Benth. Pl. Hartw. 68. 1839.

Solanum floccosum Mart. & Gal. Bull. Acad. Brux. 12¹: 141. 1845.

Solanum molinum Fernald, Trees & Shrubs 1: 97. pl. 49. 1903.

San Luis Potosí to Morelos, Oaxaca, and Puebla. Martinique.

Shrub, 1 to 2.5 meters high, the branches stellate-tomentose, armed with few short prickles or often unarmed; leaves oblong, elliptic-oblong, or oblanceolate, 18 cm. long or less, obtuse or acute, densely stellate-tomentose beneath or finely stellate-pubescent, unarmed; cymes many-flowered; corolla pale blue, 12 to 15 mm. long; fruit 6 to 10 mm. in diameter.

56. *Solanum diversifolium* Schlecht. *Linnaea* 19: 297. 1846.

Solanum torvum ochraceo-ferrugineum Dunal in DC. Prodr. 13¹: 160. 1852.

Solanum ochraceo-ferrugineum Fernald, Proc. Amer. Acad. 35: 560. 1900.

Baja California and Sinaloa to Tamaulipas, Veracruz, and Oaxaca; type from Papantla, Veracruz. Central America.

Shrub, 1 to 3 meters high, the branches stellate-tomentose, armed with few short prickles or sometimes unarmed; leaves ovate-oblong to broadly ovate, 18 cm. long or less, acute or obtuse, usually sinuate-lobate but sometimes entire, stellate-tomentose, usually unarmed; cymes few or many-flowered; corolla white or bluish, 12 to 16 mm. long; fruit 1 to 1.5 cm. in diameter. "Salvadora" (Tamaulipas); "berenjena" (Sinaloa).

Palmer reports that in Tamaulipas the fruit is employed for poisoning rats.

9. *ATHENAEA* Sendtn. in Mart. Fl. Bras. 10: 133. 1846.

1. *Athenaea nelsonii* Fernald, Proc. Amer. Acad. 35: 567. 1900.

Type collected between Tumbala and El Salto, Chiapas.

Shrub (?), the stems viscid-villous; leaves petiolate, broadly ovate, 20 cm. long or less, cuspidate-acuminate, deeply cordate at base, entire or with a few sharp teeth, sparsely villosulous beneath; pedicels fasciculate, 3 cm. long or less; calyx glandular-villous, campanulate, with 5 narrow lobes; corolla 1.5 to 2 cm. long, yellowish, deeply 5-lobate; fruit red, inclosed in the calyx.

DOUBTFUL SPECIES.

ATHENAEA XALAPENSIS (H. B. K.) Hemsl. Biol. Centr. Amer. Bot. 2: 422. 1882. *Withania xalapensis* H. B. K. Nov. Gen. & Sp. 3: 13. 1819. Type from Jalapa, Veracruz.

10. *WITHANIA* Pauquy, Diss. Bellad. 14. 1824.

1. *Withania melanocystis* Robinson, Proc. Amer. Acad. 26: 171. 1896.

Type from Tamasopo Canyon, San Luis Potosí.

Shrub, 1.5 to 2.5 meters high; leaves lanceolate or lance-oblong, 3 to 6 cm. long, acute, entire, petiolate, finely pubescent; pedicels axillary, fasciculate, 5 to 10 mm. long; calyx 5-dentate, accrescent, in fruit about 2 cm. long, bladder-like, contracted at the mouth; corolla rotate-campanulate, 1 cm. long, pale yellow with dark spots in throat, 5-lobate to the middle; fruit baccate, red, globose.

The true position of this plant is somewhat doubtful. The other species of the genus are natives of the Old World.

11. *BRACHISTUS* Miers, Ann. Mag. Nat. Hist. II. 3: 264. 1849.

Shrubs or small trees; leaves entire; pedicels geminate or fasciculate; calyx short, broadly campanulate, with 5 to 10 setaceous or minute teeth, not or scarcely accrescent; corolla broadly campanulate, the limb 5-angulate or shallowly lobate; fruit a globose berry.

Larger leaves acutely acuminate.....1. *B. diversifolius*.
Larger leaves obtuse or obtusely short-acuminate.....2. *B. pringlei*.

1. *Brachistus diversifolius* (Klotzsch) Miers, Ann. Mag. Nat. Hist. II. 3: 268. 1849.

Witheringia diversifolia Klotzsch; Walp. Repert. Bot. 3: 29. 1844.

Veracruz, Morelos, and Chiapas.

Slender shrub, 1.5 to 2.5 meters high; leaves lanceolate or lance-ovate, 4 to 11 cm. long, acute at base, thinly pilose or glabrate, the pairs of leaves very unequal, one of each pair small and often obtuse; flowers long-pedicellate, the pedicels usually recurved; corolla greenish yellow, about 7 mm. broad; fruit 6 to 8 mm. in diamter.

2. *Brachistus pringlei* S. Wats. Proc. Amer. Acad. 25: 159. 1890.

Nuevo León, Tamaulipas, and San Luis Potosí to Oaxaca; type from Sierra de la Silla, Nuevo León.

Slender shrub; leaves broadly ovate to oblong-ovate, 4.5 cm. long or less, abruptly contracted at base, sparsely pubescent or densely so beneath; corolla greenish yellow, 8 mm. broad; calyx lobes linear, somewhat elongate in fruit.

DOUBTFUL SPECIES.

BRACHISTUS LIGUSTRINUS (Dunal) Hemsl. Biol. Centr. Amer. Bot. 2: 423. 1882. *Fregirardia ligustrina* Dunal in DC. Prodr. 13¹: 507. 1852. Type from "Desierto Viejo." Scarcely of this genus, but the generic position of the plant is doubtful.

12. *BASSOVIA* Aubl. Pl. Guian. 1: 217. 1775.

Shrubs or small trees; leaves entire or sinuate; pedicels usually fasciculate, sometimes umbellate; calyx broadly campanulate, 5 to 10-dentate or truncate, not or scarcely accrescent; corolla subrotate, cleft to the middle or lower; fruit a 2-celled globose berry.

Pubescence of the leaves of stellate hairs.....1. *B. stellata*.

Pubescence of simple hairs.

Leaves sinuate-dentate.....2. *B. stramoniifolia*.

Leaves entire.

Stems setose-pilose.....3. *B. setosa*.

Stems glabrous or short-villous.

Leaves barbate beneath in the axils of the lateral nerves...4. *B. foliosa*.

Leaves not barbate beneath.

Leaves glabrous beneath; corolla 12 to 14 mm. long.

5. *B. escuintlensis*.

Leaves sparsely short-villous beneath; corolla 6 to 7 mm. long.

6. *B. mexicana*.

1. *Bassovia stellata* Greenm. Proc. Amer. Acad. 41: 246. 1905.

Hidalgo and Veracruz; type from Trinidad Iron Works, Hidalgo, altitude 1,500 meters.

Shrub, 1 to 2 meters high; leaves ovate or oblong-ovate, 5 to 9 cm. long, acuminate, entire, glabrous above or nearly so, stellate-tomentose beneath or finally glabrate; flowers numerous, long-pedicellate; calyx with short rounded lobes; corolla 5 to 6 mm. long.

2. *Bassovia stramoniifolia* (H. B. K.) Standl.

Witheringia stramoniifolia H. B. K. Nov. Gen. & Sp. 3: 13. 1819.

Brachistus stramoniifolius Miers, Ill. S. Amer. Pl. 2: 7. 1849.

Bassovia donnell-smithii Coulter, Bot. Gaz. 16: 145. 1891.

Tepic and Jalisco to Veracruz; type collected between La Banderilla and Jalapa, Veracruz. Guatemala and El Salvador.

Shrub, about 3 meters high; leaves ovate or ovate-elliptic, 5 to 11 cm. long, acute or acuminate, oblique and often subcordate at base, short-villous, especially beneath; corolla about 1 cm. long. "Belladonna montés" (El Salvador).

3. *Bassovia setosa* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 373. 1917.

Type from Zacuapan, Veracruz.

Low slender shrub; leaves lance-oblong or ovate-oblong, 3 to 4.5 cm. long, acute at base and apex, setose-pilose; flowers few, short-pedicellate; calyx with 5 lanceolate lobes; corolla about 6 mm. long, hirtellous; fruit 5 mm. in diameter.

4. *Bassovia foliosa* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 373. 1917.

Type from Zacuapan, Veracruz.

Shrub; leaves oblong or ovate-oblong, 7 to 12 cm. long, short-acuminate, acute at base, glabrous except along the costa beneath; flowers umbellate, the umbels pedunculate, 5 to 7-flowered; calyx shallowly 5-lobate; fruit 5 mm. in diameter.

5. *Bassovia escuintlensis* (Coulter) Standl.

Brachistus escuintlensis Coulter, Bot. Gaz. 16: 144. 1891.

Bassovia purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 372. 1917.

Veracruz and Chiapas. Guatemala; type from Escuintla.

Shrub, the stems glabrous or very minutely puberulent; leaves ovate to ovate-oblong, mostly 10 to 25 cm. long, acuminate, abruptly decurrent at base, thin; flowers long-pedicellate, usually numerous; calyx truncate; fruit about 7 mm. in diameter.

6. *Bassovia mexicana* Robinson, Proc. Amer. Acad. 26: 171. 1891.

Nuevo León, San Luis Potosí, and Veracruz; type from Tamasopo Canyon, San Luis Potosí.

Shrub, 1 to 4.5 meters high, the branches glabrous or sparsely short-villous; leaves long-petiolate, broadly ovate to ovate-oblong, 5 to 17 cm. long, acuminate, usually obtuse or rounded at base; flowers numerous, long-pedicellate; calyx truncate; fruit 6 to 10 mm. in diameter.

Perhaps not distinct from *B. macrophylla* (H. B. K.) Benth. & Hook.

13. **LITHOPHYTUM** T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 188. 1911.

A single species is known.

1. *Lithophytum violaceum* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 188. 1911.

Type from Santa Lucía, Puebla.

Shrub; leaves fasciculate at the nodes, oval, 4 to 7 mm. long, obtuse, entire, 3-nerved, glabrous, ciliolate; flowers pedicellate at the nodes; calyx 3 to 4 mm. long, campanulate, 5-lobate, puberulent; corolla 8 mm. long, violaceous, puberulent, salverform; anthers longitudinally dehiscent; ovary 1-celled, 2 to 4-ovulate.

It is not certain that the plant belongs to the Solanaceae. The material seen by the writer is too fragmentary for critical examination.

149. SCROPHULARIACEAE. Figwort Family.

Shrubs or more commonly herbs; leaves opposite or sometimes alternate or verticillate, entire or toothed (in the genera treated here), estipulate; flowers perfect, usually irregular; calyx inferior, 5-lobate or 5-dentate; corolla

gamopetalous, varying from rotate to funnelform, often bilabiate; stamens usually 4 and didynamous, attached to the corolla tube, the anthers commonly 2-celled; style simple; fruit capsular, many-seeded.

Numerous genera are represented in Mexico only by herbaceous species.

Leaves all alternate.

Stamens 4; leaves entire.....1. **LEUCOPHYLLUM**.

Stamens 2; leaves crenate.....2. **GHIESBREGHTIA**.

Leaves all or chiefly opposite.

Capsule dehiscent by subapical pores. Corolla tubular, red.

3. **GALVEZIA**.

Capsule dehiscent by valves.

Calyx 5-cleft nearly or quite to the base.

Sterile stamen present, nearly or quite as long as the fertile ones.

4. **PENTSTEMON**.

Sterile stamen none or minute.....5. **RUSSELIA**.

Calyx tubular or campanulate, the lobes usually shorter than the tube.

Pedicels bracteate; peduncles usually several-flowered.

Calyx tubular-campanulate, 5-dentate.....6. **BERENDTIA**.

Calyx campanulate, 5-lobate.....7. **HEMICHAEANA**.

Pedicels ebracteate, 1-flowered.....8. **DIPLACUS**.

1. **LEUCOPHYLLUM** Humb. & Bonpl. Pl. Aequin. 2: 95. 1809.

Low shrubs, the pubescence of branched hairs; leaves alternate, entire; pedicels solitary in the leaf axils; calyx 5-cleft; corolla funnelform-campanulate, purple, the 5 lobes rounded, subequal; stamens 4.

The species listed are the only ones known.

Leaves green, glabrate.

Corolla lobes glabrous within.....1. **L. pringlei**.

Corolla lobes villous within.....2. **L. laevigatum**.

Leaves densely stellate-tomentulose, whitish.

Corolla rather broadly campanulate, the lobes nearly equaling the tube.

3. **L. texanum**.

Corolla narrowly campanulate, the lobes one-third to one-half as long as the tube.

Leaves acute or attenuate at base.....4. **L. minus**.

Leaves abruptly contracted and usually rounded at base.

5. **L. ambiguum**.

1. **Leucophyllum pringlei** (Greenm.) Standl.

Faxonanthus pringlei Greenm. Trees & Shrubs 1: 23. pl. 12. 1905.

Puebla; type collected on limestone hills near Tehuacán.

Shrub, 30 to 60 cm. high; leaves linear or spatulate-linear, 1.5 cm. long or less, acute or obtuse; sepals about 8 mm. long; corolla dark purple, 2 to 2.5 cm. long, barbate in the throat.

2. **Leucophyllum laevigatum** Standl., sp. nov.

Type collected between Ramos and Inde, Durango (*Nelson* 4689; U. S. Nat. Herb. no. 332744).

Young branches densely and finely stellate-tomentose; leaves oblanceolate-spatulate, 1 to 2 cm. long, 3 to 6 mm. wide, rounded or emarginate at apex, attenuate to a very short petiole, sparsely stellate-puberulent when young but soon glabrous; sepals linear, 2 to 3 mm. long; corolla narrowly campanulate, 1.5 cm. long, the lobes villous-barbate within, nearly as long as the tube; capsule about 6 mm. long.

3. *Leucophyllum texanum* Benth. in DC. Prodr. 10: 344. 1846.

Coahuila, Nuevo León, and Tamaulipas. Western Texas; type from Laredo.

Shrub, sometimes 2.5 meters high, densely stellate-tomentulose throughout; leaves mostly obovate, 2.5 cm. long or less, obtuse or rounded at apex, acute at base, sessile or nearly so; sepals lanceolate; corolla 1.8 to 2.5 cm. long. "Cenizo" (Tamaulipas, Nuevo León, Texas); "palo cenizo" (Nuevo León); "hierba del cenizo" (Coahuila).

The plant is employed locally as a remedy for fever and ague. It is probably this species which was mentioned by Berlandier¹ as occurring in Texas where it was known as "cenicilla." Berlandier states that an infusion of the leaves was used by the Indians as a febrifuge. He proposed a new genus for the plant and called it *Teranea frutescens*, in honor of General Mier y Teran, the director of the expedition, but no formal description of the genus was published.

4. *Leucophyllum minus* A. Gray in Torr. U. S. & Mex. Bound. Bot. 115. 1859.

Chihuahua to Nuevo León and Zacatecas. Western Texas and southern New Mexico; type collected in Texas along the Pecos River.

Shrub, sometimes 1 meter high, finely stellate-tomentulose throughout; leaves spatulate-obovate, 13 mm. long or less, rounded at apex; sepals linear; corolla 1.8 to 2.5 cm. long, purple but often violet when dry.

5. *Leucophyllum ambiguum* Humb. & Bonpl. Pl. Aequin. 2: 95. pl. 109. 1809.

Leucophyllum campanulatum Miers, Ann. Mag. Nat. Hist. II. 5: 254. 1850. Zacatecas to Hidalgo.

Shrub, 1 to 3 meters high, stellate-tomentose throughout; leaves petiolate, orbicular or broadly elliptic, 2 cm. long or less, rounded at apex; sepals linear-lanceolate; corolla about 1.5 cm. long.

2. *GHIESBREGHTIA* A. Gray, Proc. Amer. Acad. 8: 629. 1873.

A single species is known.

1. *Ghiesbreghtia grandiflora* A. Gray, Proc. Amer. Acad. 8: 630. 1873.

Chiapas (type locality). Guatemala.

Tree, 7.5 meters high or less; leaves alternate, petiolate, elliptic or elliptic-oblong, 3 to 6.5 cm. long, obtuse, coarsely crenate above the middle, acute at base, pubescent; flowers solitary in the leaf axils; calyx 5-parted, the lobes linear or oblong, obtuse; corolla yellowish, about 6 cm. long, bilabiate, the upper lip erect, bilobate, the lower 3-parted; stamens 2; capsule 2 to 2.5 cm. long.

3. *GALVEZIA* Dombey; Juss. Gen. Pl. 119. 1789.

Plants suffrutescent; leaves mostly opposite, entire; flowers axillary or subracemose, red; calyx small, 5-parted; corolla tubular, the upper lip erect, bilobate, the lower lip trifid; stamens 4.

Leaves linear or oblong-linear-----1. *G. juncea*.

Leaves oval to lanceolate-----2. *G. glabrata*.

1. *Galvezia juncea* (Benth.) A. Gray, Proc. Amer. Acad. 22: 311. 1887.

Maurandia juncea Benth. Bot. Voy. Sulph. 41. 1844.

Saccularia veatchii Kellogg, Proc. Calif. Acad. 2: 17. 1863.

Baja California; type from Magdalena Bay.

Shrub 1 to 2.5 meters high, the branches terete, glabrous; leaves 1 cm. long or less, glabrous, soon deciduous; pedicels glandular-puberulent or glabrous; corolla 3 cm. long, short-pilose; capsule 6 to 8 mm. long, erect.

¹Diario de viaje de la Comisión de Límites, p. 276. 1850.

2. Galvezia glabrata T. S. Brandeg. *Zoe* 5: 167. 1903.

Southern Baja California; type from San Felipe.

Plants suffrutescent, the branches sometimes scandent; leaves often ternate, petiolate, 1 to 3 cm. long, obtuse or acute, glabrous; pedicels glabrous; corolla 2 to 3 cm. long; capsule often cernuous.

Galvezia speciosa pubescens T. S. Brandeg.¹ is a pubescent plant which is probably a form of this species.

4. PENTSTEMON Schmidel, *Icon. Pl.* 2. 1762.

Shrubs or more commonly herbs; leaves opposite, entire or dentate; flowers showy, the peduncles usually branched and arranged in terminal thrysiform panicles; calyx 5-parted; corolla bilabiate, the upper lip bilobate, the lower trifid; perfect stamens 4.

Numerous herbaceous species occur in Mexico.

Leaves linear or nearly so.

Corolla 3 cm. long, red.....1. *P. pinifolius*.

Corolla 1.5 cm. long, pink.....2. *P. linarioides*.

Leaves oblong to broadly ovate.

Leaves cordate or subcordate at base.....3. *P. cordifolius*.

Leaves acute at base.

Corolla tubular.....4. *P. baccharifolius*.

Corolla funnellform.....5. *P. antirrhinoides*.

1. Pentstemon pinifolius Greene, *Bot. Gaz.* 6: 218. 1881.

Northeastern Sonora. Southern Arizona and New Mexico; type collected near Clifton, Arizona.

Plants woody below, about 30 cm. high; leaves narrowly linear, 2.5 cm. long or less, glabrous, very numerous and somewhat crowded, entire; corolla tubular, the lips short.

2. Pentstemon linarioides A. Gray in Torr. *U. S. & Mex. Bound. Bot.* 112. 1859.

Northeastern Sonora and mountains of Baja California. Western Texas to Arizona and Utah; type from Organ Mountains, New Mexico.

Plants often woody below, 30 cm. high or less; leaves about 1 cm. long, crowded, entire, minutely puberulent; corolla funnellform.

3. Pentstemon cordifolius Benth. *Scroph. Ind. Introd.* 7. 1835.

Northern Baja California. Southern California.

Plants suffrutescent, the stems long and scandent, finely puberulent; leaves sessile or short-petiolate, ovate or broadly ovate, 4 cm. long or less, acute, serrate or denticulate, scabrous-puberulent; corolla tubular, bright red, 2.5 to 4 cm. long.

4. Pentstemon baccharifolius Hook. in Curtis's *Bot. Mag. pl.* 4627. 1852.

Pentstemon baccharifolius schaffneri Hemsl. *Biol. Centr. Amer. Bot.* 2: 443. 1882.

San Luis Potosí. Western Texas.

Plants suffrutescent, 60 cm. high or less, the branches glabrous or puberulent; leaves sessile or petiolate, oblong or elliptic-oblong, 5 cm. long or less, obtuse, entire or serrate, usually glabrous; corolla deep red, 2.5 to 3 cm. long.

¹*Zoe* 5: 167. 1903.

5. *Pentstemon antirrhinoides* Benth.; A. DC. in DC. Prodr. 10: 594. 1846.

Baja California. Southern California.

Shrub, 1.5 meters high or less, the branches puberulent or glabrous; leaves elliptic to oblong, 1.5 cm. long or less, entire or serrate; corolla yellow, 1.5 to 2.5 cm. long.

5. *RUSSELIA* Jacq. Enum. Pl. Carib. 6. 1760.

REFERENCE: Robinson, Proc. Amer. Acad. 35: 319-321. 1900.

Shrubs, the branches usually angulate; leaves opposite or verticillate, usually furnished with numerous resin glands; flowers red, mostly in cymes; calyx 5-cleft; corolla tubular, the limb somewhat bilabiate, 5-lobate, the lobes rounded; stamens 4.

Stems 4-angulate.

Leaves entire.

Corolla about 18 mm. long.....1. *R. subcoriacea*.Corolla about 13 mm. long.....2. *R. campechiana*.

Leaves crenate or serrate.

Stems with thin wings along the angles.....3. *R. tetraptera*.

Stems not winged.

Calyx lobes gradually attenuate, the tips not subulate; flowers 2 to 2.4 cm. long.....4. *R. jaliscensis*.

Calyx lobes with subulate tips; flowers 1.5 cm. long or less.

Leaves cordate at base.....5. *R. floribunda*.

Leaves rounded to acute at base.

Larger leaves cuneate-attenuate at base.....6. *R. cuneata*.Larger leaves rounded at base.....7. *R. sarmentosa*.

Stems terete or with 6 or more angles.

Stems glabrous or very minutely puberulent.

Peduncles filiform, much elongate and exceeding the bracts, 1 to 3-flowered.....8. *R. equisetiformis*.

Peduncles short, the primary ones shorter than the subtending leaflike bracts, several or many-flowered.

Stems, at least the older ones, terete.....9. *R. multiflora*.

Stems conspicuously angulate.

Stems very minutely puberulent.....10. *R. obtusata*.

Stems glabrous.

Corolla 11 to 12 mm. long.....11. *R. trachypleura*.Corolla 15 to 18 mm. long.....12. *R. verticillata*.

Stems tomentose or pilose, the hairs conspicuous.

Larger stems conspicuously angulate.....13. *R. polyedra*.

Larger stems terete or nearly so.

Leaves entire.....14. *R. purpusii*.

Leaves serrate or crenate.

Leaves cordate and clasping at base.....15. *R. rotundifolia*.

Leaves obtuse or acute at base.

Corolla 8 to 9 mm. long.....16. *R. tepicensis*.Corolla about 14 mm. long.....17. *R. pringlei*.1. *Russelia subcoriacea* Robins. & Seat. Proc. Amer. Acad. 28: 113. 1893.

Type from Tamasopo Canyon, San Luis Potosí.

Plants glabrous; leaves very short-petiolate, ovate, 6 cm. long, acuminate, lustrous above; calyx lobes acuminate.

2. *Russelia campechiana* Standl., sp. nov.

Type from Apazote, near Yohaltum, Campeche (*Goldman* 467; U. S. Nat. Herb. no. 396830).

Stems quadrangular, glabrous; petioles 7 to 9 mm. long; leaves ovate, 5 to 7.5 cm. long, 2.5 to 4 cm. wide, acuminate, rounded at base, coriaceous, entire, lustrous, glabrous; cymes many-flowered, equaling the leaflike bracts, short-pedunculate; calyx lobes ovate, subulate-acuminate; corolla 13 mm. long, the throat yellow-barbate.

3. *Russelia tetraptera* Blake, Proc. Biol. Soc. Washington 33: 120. 1920.

Tepic; type collected near the city of Tepic.

Stems glabrous; leaves sessile or short-petiolate, deltoid-ovate, 7 cm. long or less, acute or acuminate; corolla 8 to 10 mm. long.

4. *Russelia jaliscensis* Robinson, Proc. Amer. Acad. 35: 319. 1900.

Jalisco to Mexico; type from barranca near Guadalajara.

Stems glabrous; leaves rhombic-ovate or ovate, 3 cm. long or less, petiolate, thin, sparsely pubescent or glabrate; peduncles 2 or 3-flowered.

5. *Russelia floribunda* H. B. K. Nov. Gen. & Sp. 2: 359. 1817.

Guerrero and Oaxaca; type collected between Río Papagallo and Venta de Tierra Colorada.

Stems glabrous or pubescent; leaves subsessile, rounded-ovate, obtuse or acute, 7.5 cm. long or less, coarsely crenate; corolla 1 cm. long.

Russelia syringaeifolia Schlecht. & Cham.,¹ described from Papantla, Veracruz, is a closely related plant and perhaps synonymous.

6. *Russelia cuneata* Robinson, Proc. Amer. Acad. 44: 613. 1909.

Michoacán or Guerrero to Oaxaca; type from El Ocote.

Plants suffrutescent, about 1 meter high, the branches glabrous; leaves sessile or short-petiolate, ovate or rhombic-ovate, obtuse, crenate; corolla about 1 cm. long.

7. *Russelia sarmentosa* Jacq. Enum. Pl. Carib. 25. 1760.

Veracruz and Yucatán. Central America; Cuba.

Stems glabrous; leaves short-petiolate, broadly ovate, 5 cm. long or less, acute, subcoriaceous, coarsely crenate-serrate; corolla about 1 cm. long. "Lluvia de coral" (Nicaragua).

8. *Russelia equisetiformis* Schlecht. & Cham. Linnaea 6: 377. 1831.

Russelia juncea Zucc. Flora 1832²: Beibl. 99. 1832.

Sinaloa (perhaps only cultivated) to Veracruz; type from Papantla, Veracruz. Guatemala.

Plants glabrous, herbaceous or suffrutescent; leaves small, ovate or lanceolate, caducous; inflorescence much branched; corolla usually 2 cm. long. "Arete de la cocinera" (Veracruz); "lluvia de coral;" "coralillo;" "lluvia de fuego," "coralitos" (Colombia).

A rather showy plant, common in cultivation in tropical and subtropical regions.

9. *Russelia multiflora* Sims in Curtis's Bot. Mag. pl. 1528. 1813.

Russelia paniculata Mart. & Gal. Bull. Acad. Brux. 12²: 19. 1845.

Veracruz, Puebla, Oaxaca, and Chiapas. Guatemala.

Plants suffrutescent, 1.5 meters high or less; leaves short-petiolate, ovate, 6 cm. long or less, often ternate, acuminate; corolla about 1 cm. long. "Sapoyolillo" (Chiapas, *Seler*).

¹ Linnaea 6: 376. 1831.

10. *Russelia obtusata* Blake, Proc. Biol. Soc. Washington **33**: 119. 1920.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Stems with much thickened, obtuse angles; leaves short-petiolate, ovate or elliptic, 3 cm. long or less, obtuse, crenate or serrate, obtuse or acute at base; calyx lobes acute; corolla 12 to 14 mm. long.

11. *Russelia trachypleura* Robinson, Proc. Amer. Acad. **36**: 474. 1901.

Type from Sierra de Tepoxtlán, Morelos, altitude 2,250 meters.

Stems 6-angulate, the angles roughened by small callosities; leaves short-petiolate, opposite or ternate, elliptic-ovate, 3 cm. long or less, obtuse or acute, serrate; calyx lobes caudate-acuminate.

12. *Russelia verticillata* H. B. K. Nov. Gen. & Sp. **2**: 360. 1817.

Russelia deamii Robinson, Proc. Amer. Acad. **36**: 474. 1901.

Chihuahua and Durango to Guerrero and Morelos; type from Puente de la Madre de Dios. Central America.

Stems 6-angulate; leaves short-petiolate, ovate or elliptic, 2.5 cm. long or less, obtuse or acute, thin, serrate, glabrous or villous.

Russelia deamii is a form with villous leaves. It may be specifically distinct, but it seems more probable that it is only a form of *R. verticillata*.

13. *Russelia polyedra* Zucc. Abh. Akad. Wiss. Muenchen **2**: 328. 1832-36.

Russelia retrorsa Greene, Pittonia **1**: 176. 1888.

Baja California and Sonora to Tamaulipas, Veracruz, and Chiapas. Central America.

Plants suffrutescent, 2.5 meters high or less, the stems 6-angulate, sparsely or densely pubescent; leaves short-petiolate, ovate or broadly ovate, 6 cm. long or less, acute, rounded to acute at base; corolla about 1.5 cm. long. "Hierba de la sueña" (Tamaulipas); "coral de la playa," "coral" (Oaxaca).

It is probable that the proper name for this species is *R. ternifolia* H. B. K.¹ The description of that species agrees well with *R. polyedra* except that the leaves are described as larger than in any specimens seen by the writer.

14. *Russelia purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. **4**: 385. 1913.

Type from Baños del Carrizal, Veracruz.

Branches densely pubescent; leaves ovate, 6.5 cm. long or less, acuminate, subcordate at base, short-petiolate, pubescent beneath; calyx lobes ovate, subulate-acuminate; corolla about 1.5 cm. long.

15. *Russelia rotundifolia* Cav. Icon. Pl. **5**: 9. pl. 415. 1799.

Guerrero.

Shrub, the branches densely pubescent; leaves reniform to rounded-ovate, sessile, 8 cm. long or less, obtuse or rounded at apex, coriaceous, densely pubescent beneath and with prominent and reticulate venation; corolla about 1 cm. long.

16. *Russelia tepicensis* Robinson, Proc. Amer. Acad. **35**: 321. 1900.

Russelia furfuracea T. S. Brandeg. Zoe **5**: 219. 1905.

Sinaloa and Tepic; type from Zopilote, Tepic.

Stems striate, densely pubescent; leaves sessile or short-petiolate, mostly ternate, ovate to rounded-ovate, 4.5 cm. long or less, obtuse, rounded to acute at base, crenate or serrate; flowers in short dense cymes.

17. *Russelia pringlei* Robinson, Proc. Amer. Acad. **43**: 26. 1907.

Guerrero; type from limestone cliffs of Iguala Canyon, altitude 750 meters.

Plants 1 to 2 meters high, the stems densely pubescent, striate; leaves short-petiolate, ovate, 1 to 1.5 cm. long, acute, serrate, densely glandular beneath; cymes short, few-flowered.

¹ Nov. Gen. & Sp. **2**: 359. 1817.

6. **BERENDTIA** A. Gray, Proc. Amer. Acad. 7: 379. 1868.

Shrubs; leaves opposite, entire or toothed; peduncles axillary, 1 to 5-flowered; calyx tubular-campanulate, 5-dentate, 5-costate; corolla tube ampliate above, the limb bilabiate, the lobes spreading; stamens 4.

The species listed are the only ones known.

- Plants glabrous.....1. *B. levigata*.
 Plants copiously pubescent.
 Peduncles mostly 3 to 5-flowered.....2. *B. coulteri*.
 Peduncles 1-flowered.
 Flowers 3.5 to 5 cm. long.....3. *B. rugosa*.
 Flowers about 1.5 cm. long.....4. *B. spinulosa*.

1. *Berendtia levigata* Robins. & Greenm. Proc. Amer. Acad. 32: 39. 1896.

Puebla; type from Tehuacán.

Shrub, 1 meter high or less; leaves ovate-elliptic to lance-oblong, 4.5 cm. long or less, short-petiolate, acute, dentate above the middle; peduncles 1-flowered; corolla about 4 cm. long, orange with crimson spots.

2. *Berendtia coulteri* A. Gray, Proc. Amer. Acad. 7: 380. 1868.

The type locality is not stated by Gray; Hemsley gives it as "Zimapan and San Blas to Guadalajara."

Leaves oblong or obovate, nearly entire; corolla tube scarcely exerted from the calyx, the limb about 12 mm. broad.

3. *Berendtia rugosa* (Benth.) A. Gray, Proc. Amer. Acad. 7: 380. 1868.

Diplacus rugosus Benth. in DC. Prodr. 10: 368. 1846.

Berendtia ghiesbreghtii A. Gray, Proc. Amer. Acad. 7: 380. 1868.

Chiapas.

Plants villous; leaves ovate or obovate-oblong, 3.5 cm. long, crenate-dentate above the middle; corolla tube 3 times as long as the calyx; corolla "scarlet."

4. *Berendtia spinulosa* S. Wats. Proc. Amer. Acad. 25: 159. 1890.

Known only from the Sierra Madre near Monterrey, Nuevo León, on limestone ledges.

Much-branched shrub, glandular-hispidulous throughout; leaves linear-ob lanceolate to elliptic-oblong, acute or obtuse, sessile or short-petiolate, entire or with a few obscure teeth, the margins revolute; corolla yellow.

7. **HEMICHAEANA** Benth. Pl. Hartw. 78. 1841.

A single species is known.

1. *Hemichaena fruticosa* Benth. Pl. Hartw. 78. 1841.

Leucocarpus fruticosus Benth. in DC. Prodr. 10: 336. 1846.

Oaxaca and Chiapas. Central America; type from Quezaltenango, Guatemala.

Plants herbaceous or suffrutescent, about 1 meter high, viscid-villous, the branches terete; leaves opposite, ovate-oblong or oblong-lanceolate, 12 cm. long or less, acute or acuminate, sessile and clasping, dentate; flowers in few-flowered pedunculate axillary cymes; calyx campanulate, 5-lobate, scarcely angulate; corolla about 4 cm. long, the tube broad, the limb 5-lobate, bilabiate; stamens 4.

8. DIPLACUS Nutt. Ann. Nat. Hist. 1: 137. 1838.

Shrubs; leaves opposite, entire or toothed; flowers axillary, solitary, large and showy; calyx tubular, 5-angulate, obliquely 5-dentate; corolla funnelform, the limb bilabiate, the upper lip bilobate, the lower 3-lobate; stamens 4.

The species of this genus are often placed in *Mimulus*.

Corolla red-----1. *D. puniceus*.
Corolla yellow-----2. *D. longiflorus*.

1. Diplacus puniceus Nutt. Ann. Nat. Hist. 1: 137. 1838.

Northern Baja California, ranging from sea level to 900 meters. Southern California; type collected near San Diego.

Shrub, about a meter high; leaves sessile, linear to linear-oblong, 6 cm. long or less, entire or serrate, glutinous and sometimes sparsely pubescent beneath; flowers pedicellate, the calyx glabrous or nearly so; corolla 3.5 to 4.5 cm. long.

2. Diplacus longiflorus Nutt. Ann. Nat. Hist. 1: 139. 1838.

Diplacus stellatus Kellogg, Proc. Calif. Acad. 2: 18. 1863.

Diplacus arachnoidcus Greene, Bull. Calif. Acad. 1: 210. 1885.

Baja California. Southern California; type from Santa Barbara.

Shrub, 1 to 1.5 meters high; leaves linear to ovate-oblong, 5 cm. long or less, sessile or short-petiolate, entire or nearly so, usually with sparse pubescence of branched hairs beneath; calyx often villous; corolla 3.5 to 5.5 cm. long.

BULLETIN OF THE UNITED STATES NATIONAL MUSEUM

II

TREES AND SHRUBS OF MEXICO

By PAUL C. STANDLEY.

150. BIGNONIACEAE. Bignonia Family.

Trees or shrubs, often woody vines; leaves opposite or ternate, simple or usually compound, the terminal leaflet frequently replaced by a tendril; flowers perfect, irregular, usually large and showy; calyx inferior, gamosepalous, often closed in bud, spathaceous, truncate, or 5-dentate; corolla gamopetalous, the limb 5-lobate, the lobes usually somewhat unequal; stamens usually 4, inserted on the upper part of the corolla tube; fruit capsular or baccate, often very large.

Pyrostegia venusta (Ker) Baill. is often cultivated in Mexico. It is a vine with bifoliolate leaves and large clusters of long narrow red-orange flowers, native of Brazil. In El Salvador it is called "San Carlos." *Tecomaria capensis* (Thunb.) Fenzl, a native of South Africa, also is frequently cultivated. It is a vine with pinnate leaves and large, orange-red or scarlet, very showy flowers.

Plants scandent; leaves, at least some of them, with tendrils, and bifoliolate.

Tendrils with sharp-pointed hooked tips; corolla yellow-----1. **BIGNONIA.**

Tendrils without sharp-pointed hooked tips; corolla not yellow.

Disk absent. Flowers purple or pink; fruit linear-----2. **CYDISTA.**

Disk present at base of ovary.

Calyx apparently double, with 2 or 3 interior lobelike appendages. Flowers purple or pink; capsule oblong-elliptic, smooth.

3. **AMPHILOPHIUM.**

Calyx simple, not appendaged.

Corolla white, turning yellowish; fruit muricate, oblong or elliptic.

4. **PITHECOCTENIUM.**

Corolla pink, purple, or orange-red; fruit not muricate.

Corolla orange-red, coriaceous, 9 to 11 cm. long.

5. **PHAEDRANTHUS.**

Corolla pink or purple; corolla less than 9 cm. long.

Capsule oblong or ellipsoid.

Corolla coriaceous-----6. **DISTICTIS.**

Corolla thin-----7. **ADENOCALYMNA.**

Capsule linear. Corolla thin.

Calyx campanulate or tubular-campanulate. 8. **ARRABIDAEA.**

Calyx broadly campanulate or saucer-shaped.

9. **PETASTOMA.**

Plants erect; leaves never with tendrils, simple, digitately 5 to 9-foliolate, pinnate, or rarely 3-foliolate.

Leaves pinnate. Flowers yellow-----10. **TECOMA.**

Leaves simple or digitately compound.

Leaflets 5 to 9; petioles not winged; fruit capsular.

Stamens pubescent; leaflets usually 7 or 9; corolla yellow.

11. **GODMANIA.**

Stamens glabrous; leaflets usually 5; corolla yellow, pink, or purple.

12. TABEBUIA.

Leaflets 1 to 3, rarely 5, but the petioles then broadly winged; fruit capsular or baccate.

Leaves simple, linear; fruit capsular.

Flowers yellow; seeds glabrous, broadly winged...**13. ASTIANTHUS.**

Flowers white or pink; seeds long-hairy, not winged...**14. CHILOPSIS.**

Leaves compound or, if simple, broader than linear; fruit baccate.

Leaves alternate, simple; fruit 2-celled.....**15. AMPHITECNA.**

Leaves opposite or fasciculate, simple or compound; fruit 1-celled.

Calyx spathaceous, slit along one side; fruit elongate, cylindric; plants usually armed with short spines; leaves 3-foliolate

16. PARMENTIERA.

Calyx campanulate, irregularly cleft or truncate; fruit globose or oval; plants unarmed; leaves simple or compound

17. CRESCENTIA.**1. BIGNONIA** L. Sp. Pl. 622. 1753.**1. Bignonia unguis-cati** L. Sp. Pl. 623. 1753.

?*Bignonia pubescens* L. Sp. Pl. ed. 2. 870. 1763.

?*Doxantha mexicana* Miers, Proc. Hort. Soc. Lond. **3**: 190. 1863.

Bignonia acutistipula Schlecht. Linnaea **26**: 375. 1854.

?*Bignonia lanuginosa* Hemsl. Biol. Centr. Amer. Bot. **2**: 491. 1882.

Bignonia californica T. S. Brandeg. Zoe **5**: 170. 1903.

Baja California and Sonora to Oaxaca, Yucatán, Veracruz, and Tamaulipas. West Indies; South America.

Woody vine, the branches often with aerial roots; leaves slender-petiolate; leaflets 2, the third one replaced by a tendril, this trifid, each branch ending in a sharp hook; leaflets lance-oblong to broadly ovate, 3 to 8 cm. long or larger, acute, obtuse to cordate at base, entire, thin, glabrous or pubescent; flowers yellow, the peduncles axillary, 1 or few-flowered; calyx campanulate, loose, 1.3 to 2 cm. long, subtruncate or irregularly lobate; corolla funnelform-campanulate, 4.5 to 7 cm. long; capsule linear, obcompressed, 30 to 40 cm. long, 1 to 1.5 cm. wide, smooth; seeds 2 to 2.5 cm. long, winged. "Xeanol-ak" (Yucatán, Maya); "bejuco legítimo," "San Pedro de guía" (Tamaulipas); "liana uñada," "pegapalo" (Porto Rico); "uña de gato" (Cuba, Porto Rico); "bejuco perdiz" (Cuba); "mano de cachora" (Sinaloa); "bejuco de uña" (El Salvador).

The plant is said to be used locally as a remedy for snake bites and manchineel (*Hippomane mancinella*) poisoning. It is reported also to have been employed as a febrifuge and for intestinal inflammation.

2. CYDISTA Miers, Proc. Hort. Soc. Lond. **3**: 191. 1863.

Scandent shrubs; leaves bifoliolate and often tendril-bearing, entire; flowers large, in chiefly terminal, few-flowered, lax racemes or panicles; calyx campanulate, truncate or 5-denticulate; corolla funnelform-campanulate; fruit capsular, linear, obcompressed, smooth; seeds compressed, broadly winged.

Corolla 5 to 8 cm. long.....**1. C. aequinoctialis.**

Corolla 3 to 4 cm. long.....**2. C. diversifolia.**

1. Cydista aequinoctialis (L.) Miers, Proc. Hort. Soc. Lond. **3**: 191. 1863.

Bignonia aequinoctialis L. Sp. Pl. 623. 1753.

Arrabidaea potosina Schum. & Loes. Bull. Herb. Boiss. **3**: 618. 1895.

Cydista potosina Loesener, Repert. Sp. Nov. Fedde **16**: 209. 1919.

Petastoma langlasseanum Kränzlein, Repert. Sp. Nov. Fedde **17**: 56. 1921.

Sinaloa to Tamaulipas, Veracruz, Yucatán, Tabasco, and Chiapas. West Indies; Central and South America.

Large vine; leaflets oblong to broadly ovate, 5 to 16 cm. long, acute or acuminate, usually obtuse or rounded at base, coriaceous, often very lustrous and with prominent reticulate venation, glabrous or sometimes sparsely hirtellous beneath; calyx 6 to 8 mm. long; corolla pink or pale purple, lepidote outside; fruit 25 to 40 cm. long or larger, 1.5 to 2 cm. wide, often with a dorsal ridge on each side. "Cebollín" (Michoacán, Guerrero); "chacanicab" (Yucatán, Maya); "bejuco tres-lomos" (Tabasco); "bejuco blanco," "liana de la sierra" (Porto Rico); "cuamecate blanco" (Nayarit); "cuero de vaca" (Sinaloa); "ajillo," "bejuco de ajo," "bejuco perdedor" (El Salvador).

The material referred here is variable and perhaps susceptible of division into two or more species. When crushed, the vine exhales a strong odor of garlic.

2. *Cydista diversifolia* (H. B. K.) Miers, Proc. Hort. Soc. Lond. 3: 192. 1863.

Bignonia diversifolia H. B. K. Nov. Gen. & Sp. 3: 133. 1818.

Michoacán to Chiapas and Yucatán; type from Campeche.

Slender vine; leaflets broadly ovate to oblong-elliptic, 4 to 9 cm. long, acuminate, obtuse to cordate at base, glabrous; calyx 4 to 5 mm. long; corolla purple, finely lepidote. "Chacxnetoloc," "xcolak" (Yucatán, Maya).

3. AMPHILOPHIUM Kunth, Journ. de Phys. 87: 451. 1818.

Scandent shrubs; leaves opposite, 3-foliolate or the terminal leaflet absent or replaced by a tendril, the leaflets entire; flowers large, purple, in a terminal panicle; calyx campanulate, the limb ampliate, sinuate, bearing 2 or 3 lobelike appendages within; corolla tube cylindric, the limb longer than the tube, bilabiate, the posterior lip shallowly bilobate, the anterior one 3-lobate; stamens 4; capsule oblong-elliptic, thick, compressed, smooth or nearly so; seeds broadly winged.

Leaflets finely stellate-pubescent beneath..... 1. **A. molle.**

Leaflets merely lepidote beneath, or often barbate along the costa.

2. **A. paniculatum.**

1. *Amphilophium molle* Schlecht. & Cham. Linnæa 5: 120. 1830.

Tamaulipas and Veraeruz; reported from Hidalgo. Central America.

Leaves long-petiolate, the leaflets long-petiolulate, broadly ovate or rounded-ovate, 6 to 10 cm. long, short-acuminate, usually cordate at base, stellate-pubescent or glabrate above; calyx about 1 cm. long; corolla 3 to 4 cm. long. "Cuchara de pico," "pico de pato," "cuchara de pato," "cucharillo" (El Salvador).

Doubtfully distinct from *A. paniculatum*.

2. *Amphilophium paniculatum* (L.) H. B. K. Nov. Gen. & Sp. 3: 149. 1818.

Bignonia paniculata L. Sp. Pl. 623. 1753.

Sinaloa to Guerrero; reported from Tabasco. Porto Rico and the Lesser Antilles; Guatemala to Peru and the Guianas.

Leaflets rounded-ovate, 4.5 to 10 cm. long, abruptly short-acuminate, cordate at base, minutely lepidote on both surfaces; corolla 3 to 4 cm. long; fruit 8 to 10 cm. long, 4 cm. wide, obtuse or acute at apex. "Pico de pato" (Tabasco, *Rovirosa*; Nicaragua); "liana de cuello" (Porto Rico).

4. PITHECOCTENIUM Mart.; DC. Prodr. 9: 193. 1845.

1. *Pithecoctenium echinatum* (Jacq.) Schum. in Engl. & Prantl, Pflanzenfam.

4^{3b}: 218. 1894.

Bignonia echinata Jacq. Enum. Pl. Carib. 25. 1760.

Pithecoctenium muricatum Moc.; DC. Prodr. 9: 194. 1845.

Pithecoctenium hexagonum DC. Prodr. 9: 195. 1845.

Sinaloa to Tamaulipas, Yucatán, and Oaxaca. Guatemala to Peru and Brazil; type from Cartagena, Colombia.

Large scandent shrub, the branches angulate; leaves opposite, long-petiolate, 3 or 2-foliolate, the terminal leaflet often replaced by a trifid tendril; leaflets ovate or rounded-ovate, 6 to 10 cm. long, usually short-acuminate, truncate or cordate at base, entire, finely lepidote and often pubescent; flowers white, turning yellow in age, in terminal racemes or panicles; calyx campanulate, subtruncate; corolla campanulate-funnelform, 4.5 to 5 cm. long, curved, tomentulose outside; fruit oblong or elliptic, 15 to 20 cm. long, 4.5 to 6.5 cm. wide, somewhat compressed, the valves hard and woody, densely covered with large sharp tubercles; seeds broadly winged, 6 to 8 cm. broad. "Güico" (Sinaloa); "xnetoloe" (Yucatán, Maya); "mariposa" (San Luis Potosí, Oaxaca; seeds); "palomitas" (seeds; San Luis Potosí, Oaxaca); "lengua de vaca" (Tamaulipas, Guatemala); "bejuco de huico" (Sinaloa, Oaxaca); "corneta" (Oaxaca); "hiedra bocina" (Herrera); "clarín" (Oaxaca); "petaquillas" (seeds; Morelos, Guatemala); "cucharilla" (Costa Rica); "hoja de cucharilla" (Guatemala); "peine de mico" (Nicaragua, Costa Rica); "tonalxochitl" (Nahuatl, *Reko*); "pico de pato," "bateita" (El Salvador).

The large seeds are light and float through the air, hence the names "mariposas" ("butterflies") and "palomitas" ("little doves") applied to them. They are widely used in Mexico as a remedy for headache, being moistened and stuck upon the forehead. The hard portion of the seed is ground, mixed with tallow, and applied to the temples as a remedy for sore eyes (in Tamaulipas, according to Palmer). A decoction of the flowers is said to have been used by the Aztecs as a remedy for fevers. The curious rough fruits are used as back scratchers and pin-cushions.

DOUBTFUL SPECIES.

PITHECOCTENIUM TRIBRACHIATUM Loesener, Repert. Sp. Nov. Fedde 16: 209. 1919. Type from Zacuapan, Veraacruz.

5. *PHAEDRANTHUS* Miers, Proc. Hort. Soc. Lond. 3: 182. 1863.

A single species is known.

1. *Phaedranthus buccinatorius* (DC.) Miers, Proc. Hort. Soc. Lond. 3: 182. 1863.

Pithecoctenium buccinatorium DC. Prodr. 9: 195. 1845.

Bignonia buccinatoria Mariet; DC. Prodr. 9: 195, as synonym. 1845.

Bignonia ghiesbreghtii Heller, Linnaea 30: 45. 1859.

Phaedranthus lindleyanus Miers, Proc. Hort. Soc. Lond. 3: 182. 1863.

Phaedranthus exsertus Miers, Proc. Hort. Soc. Lond. 3: 182. 1863.

Phaedranthus cinerascens Miers, Proc. Hort. Soc. Lond. 3: 182. 1863.

Jalisco and San Luis Potosí to Puebla.

Large vine; leaflets 2, the third one usually represented by a tendril, oblong to oval or ovate-elliptic, 5 to 9 cm. long, acute to rounded at apex, rounded or subcordate at base, entire, lepidote beneath, coriaceous; flowers purple-red, in few-flowered terminal panicles; calyx campanulate, 1 to 1.5 cm. long, obscurely 5-dentate, densely tomentose; corolla coriaceous, tubular-funnelform, 9 to 11 cm. long, tomentulose outside, the lobes short, rounded. "Trompetilla grande" (Querétaro); "clarín," "hiedra bocina" (*Ramírez*).

The plant is often cultivated in Mexico.

6. *DISTICTIS* Bureau, Monogr. Bignon. 46. 1864.

Scandent shrubs; leaves opposite, 2 or 3-foliolate, the terminal leaflet often represented by a tendril, the leaflets entire; flowers large and showy, purple or pink, in terminal racemes or panicles; calyx campanulate, truncate or 5-denticulate; corolla funnelform-campanulate; capsule oblong or elliptic, smooth, obcompressed; seeds broadly winged.

Pubescence of simple hairs.....1. *D. laxiflora*.
 Pubescence of stellate hairs.....2. *D. rovirosana*.

1. *Distictis laxiflora* (DC.) Greenm. Proc. Amer. Acad. 33: 486. 1898.

Pithecoctenium laxiflorum DC. Prodr. 9: 195. 1845.

Pithecoctenium cinereum DC. Prodr. 9: 195. 1845.

Distictis cinerea Greenm. Proc. Amer. Acad. 33: 487. 1898.

Jalisco and Guanajuato to Puebla and Oaxaca; type from Oaxaca.

Woody vine; leaves bifoliolate, the leaflets broadly ovate to oblong-elliptic, 3 to 6 cm. long, acute to rounded at apex, rounded at base, entire, lepidote, pubescent; flowers purple, in few-flowered terminal racemes or panicles; calyx tomentulose; corolla 5.5 to 8.5 cm. long, densely tomentulose outside; capsule oblong-elliptic, 7 to 9 cm. long, 4 cm. long, nearly smooth, with a dorsal ridge on each valve, glabrous; seeds broadly winged. "Jeroliz morado" (Querétaro); "manto de la Virgen."

This plant is often cultivated in Mexico.

2. *Distictis rovirosana* Donn. Smith, Bot. Gaz. 20: 7. 1895.

Tabasco, the type from Atasta. Guatemala to Nicaragua.

Leaflets oblong-obovate to oval, 10 to 15 cm. long, caudate-acuminate, usually retuse, stellate-pubescent when young; calyx 5 to 6 mm. long, velutinous; corolla pink, about 5 cm. long; capsule oblong, 9.5 cm. long, 3.5 cm. wide. "Pie de gallo" (Tabasco).

Not seen by the writer.

7. **ADENOCALYMNA** Mart.; DC. Prodr. 9: 199. 1845.

Scandent shrubs; leaves normally bifoliolate, with a terminal tendril, but often trifoliolate, the leaflets entire; flowers large, pink or purple, in chiefly terminal racemes or panicles; calyx campanulate, truncate or 5-dentate, glandular within, pubescent; corolla elongate-funnelform; capsule oblong or broadly linear, compressed parallel with the septum or subterete, usually tuberculate-rugose; seeds usually broadly winged.

Calyx not conspicuously nerved; corolla 5 to 6 cm. long...1. *A. alboviolaceum*.

Calyx conspicuously nerved, the nerves tortuous, excurrent in the small calyx teeth; corolla 3 to 5 cm. long.

Corolla 3 to 3.5 cm. long.....2. *A. seleri*.

Corolla 4.5 to 5 cm. long.....3. *A. fissum*.

1. *Adenocalymna alboviolaceum* Loesener, Verh. Bot. Ver. Brand. 56: 100. 1923.

Oaxaca and Veraacruz; type from Tehuantepec, Veraacruz.

Leaflets ovate, obtuse or acutish, rounded or subcordate at base, 3 to 5 cm. long or larger, puberulent or glabrate beneath; calyx 5 to 6 mm. long, puberulent; corolla purplish, glabrous. "Loobaa-beete" (Oaxaca).

2. *Adenocalymna seleri* Loesener, Verh. Bot. Ver. Brand. 56: 101. 1923.

Type collected between Ticul and Tabi, Yucatán.

Leaflets ovate-lanceolate, villosulous and glandular-punctate beneath; calyx 6 to 8 mm. long, sparsely villosulous, the teeth scarcely 1 mm. long; corolla puberulent. "Oppol che."

3. *Adenocalymna fissum* Loesener, Verh. Bot. Ver. Brand. 56: 102. 1923.

Type from Xkombee, Yucatán.

Leaflets ovate-lanceolate, acute or obtuse at base, about 6.5 cm. long, puberulent on the nerves; inflorescence puberulent; calyx 8 mm. long, villosulous; corolla sparsely puberulent, cleft on one side.

8. **ARRABIDAEA** DC. *Bibl. Univ. Genève* 17: 126. 1838.

Scandent shrubs; leaves opposite, 2 or 3-foliolate, the leaflets entire, the terminal one often replaced by a tendril; flowers large or small, in chiefly terminal panicles; calyx campanulate, truncate or 5-denticulate; corolla funnelform-campanulate; fruit a linear capsule, obcompressed.

Corolla 1.3 to 1.8 cm. long.....1. **A. floribunda**.

Corolla 3.5 to 4.5 cm. long.

Corolla thinly villosulous outside.....2. **A. litoralis**.

Corolla densely and closely tomentellous.....3. **A. seleriana**.

1. **Arrabidaea floribunda** (H. B. K.) Loesener, *Repert. Sp. Nov. Fedde* 16: 209. 1919.

Bignonia floribunda H. B. K. *Nov. Gen. & Sp.* 3: 134. 1818.

Bignonia andrieuxii DC. *Prodr.* 9: 156. 1845.

?*Arrabidaea pseudochica* Kränzlein, *Repert. Sp. Nov. Fedde* 17: 19. 1921.

Oaxaca, Campeche (type locality), and Yucatán.

Leaflets 2, ovate to ovate-oblong, 9 cm. long or less, obtusely acuminate or obtuse, rounded or obtuse at base, glabrous, lustrous, the upper leaves, at least, purple when dried; panicles large and many-flowered; calyx 3 mm. long, truncate, purple-tomentulose; corolla purple, puberulent. "Xbaque ak" (Yucatán, Maya).

2. **Arrabidaea litoralis** (H. B. K.) Standl.

Bignonia litoralis H. B. K. *Nov. Gen. & Sp.* 3: 139. 1818.

Guerrero; type from Acapulco.

Large vine; leaflets 2 or 3, broadly ovate to elliptic, 13 cm. long or less, acuminate, rounded at base, pubescent or glabrate beneath; panicles large and many-flowered; calyx 3 to 4 mm. long, puberulent; corolla purple; fruit 20 to 35 cm. long, 10 to 13 mm. wide, glabrous. "Bejuco vaquero."

Palmer reports that the stems are used for clotheslines.

3. **Arrabidaea seleriana** Loesener, *Verh. Bot. Ver. Brand.* 56: 99. 1923.

Type from Tequisistlán, Oaxaca. Guatemala.

Leaves not known; flowers "pale red," 3 to scarcely 4 cm. long; calyx 3 to 6 mm. long, very shortly puberulent, obscurely 5-dentate.

9. **PETASTOMA** Miers, *Proc. Hort. Soc. Lond.* 3: 194. 1863.

1. **Petastoma patelliferum** (Schlecht.) Miers, *Proc. Hort. Soc. Lond.* 3: 195. 1863.

Bignonia patellifera Schlecht. *Linnaea* 8: 516. 1833.

Veracruz, Oaxaca, and Chiapas; type from Hacienda de la Laguna, Veracruz. Central America to Brazil.

Large woody vine; leaves opposite, bifoliolate, often ending in a tendril but the tendril more commonly absent; leaflets elliptic or broadly ovate, 5 to 13 cm. long, short-acuminate, rounded at base, densely pubescent or glabrate, entire; flowers purple, in large terminal leafy panicles; calyx broadly campanulate or saucer-shaped, truncate, glabrous or nearly so; corolla funnelform-campanulate, pale purple, 3.5 to 4 cm. long, glabrous outside except on the lobes; capsule obcompressed, linear, 20 to 30 cm. long, 10 to 13 mm. wide, smooth, glabrous; seeds winged, 15 to 17 mm. wide. "Bejuco de corral" (El Salvador).

10. **TECOMA** Juss. *Gen. Pl.* 139. 1789.

1. **Tecoma stans** (L.) H. B. K. *Nov. Gen. & Sp.* 3: 144. 1818.

Bignonia stans L. *Sp. Pl. ed. 2.* 871. 1763.

Tecoma mollis H. B. K. *Nov. Gen. & Sp.* 3: 144. 1818.

Tecoma stans velutina DC. *Prodr.* 9: 224. 1845.

Stenolobium stans Seem. Journ. Bot. 1: 88. 1863.

Stenolobium incisum Rose & Standl. Contr. U. S. Nat. Herb. 16: 174. 1913.

Stenolobium tronadora Loesener, Repert. Sp. Nov. Fedde 16: 210. 1919.

Stenolobium quinquejugum Loesener, Repert. Sp. Nov. Fedde 16: 211. 1919.

Nearly throughout Mexico. Widely distributed in tropical and subtropical America.

Shrub or small tree, 1 to 8 meters high; leaves opposite, pinnate, the leaflets 5 to 13, linear-lanceolate to ovate-lanceolate or elliptic, acute or acuminate, serrate or rarely entire, glabrous beneath or often pubescent or tomentose; flowers bright yellow, in terminal racemes or panicles; calyx tubular-campanulate, 5-dentate; corolla 3.5 to 5 cm. long, funnelform-campanulate, the limb somewhat bilabiate, 5-lobate; stamens 4; capsule linear, 10 to 20 cm. long, about 6 mm. broad, loculicidally dehiscent, compressed; seeds winged. "Retamo" or "retama" (Michoacán, Guerrero, Jalisco, Mexico, Durango); "tronador" or "tronadora" (Zacatecas, Guanajuato, Mexico, Hidalgo); "trompetilla" (Hidalgo); "trompeta" (Durango); "gloria" (Sinaloa); "kanlo," "xkanlol" (Yucatán, Maya); "guie-bichi" (Oaxaca, Zapotec, *Reko*); "tulasúchil" (Oaxaca); "palo de arco" (Chihuahua, Sonora, Oaxaca); "flor de San Pedro," "San Pedro" (Tamaulipas, San Luis Potosí, Veracruz, Durango, Coahuila, Mexico); "corneta amarilla" (Durango); "nixtamaxochitl" or "nextamalxochitl" (Nahuatl); "borla de San Pedro" (Chiapas, San Luis Potosí, Mexico); "hierba de San Nicolás," "hierba de San Pedro" (*Flores*); "flor amarilla" (Yucatán, Nicaragua); "miñona" (Nuevo León); "mazorca," "huachacata," "icheculili" (*Ramírez*); "sauco amarillo" (Cuba, Porto Rico); "roble amarillo," "ruibarba" (Porto Rico); "copete" (Panama); "sardinillo" (Nicaragua); "fresno," "chirlobirlos," "palo hueso" (Colombia); "tache," "tasto" (El Salvador); "candelillo" (Costa Rica); "garrocha" (Argentina, Uruguay); "garanguay amarillo," "guaran-guaran" (Argentina); "San Andrés," "marchucha," "tagualaishte" (El Salvador).

The shrub is sometimes known as "trumpet-flower" or "yellow elder." It is a showy plant and is common in cultivation. The flowers are slightly fragrant and are said to yield much honey. The wood is of little value but it was formerly used by the Indians for making bows. The roots are reported to be a powerful diuretic, and tonic, antisyphilitic, and vermifuge properties are ascribed to the plant. In Veracruz a decoction of the flowers and bark is administered for pains in the stomach, and in some parts of Mexico the plant has the reputation of alleviating and even curing diabetes. At Guadalajara the roots are said to be used for making a kind of beer.

The species is a variable one, but although the writer has spent a large amount of time in study of the extensive series of specimens available, it has been impossible to find any reliable characters by which to assign the material to two or more species. In the typical form the leaflets are usually glabrous. *T. stans velutina* is a form in which the leaflets are pubescent or tomentose beneath. This has usually been maintained as a distinct species, but there is every possible gradation between the forms with glabrous leaflets and those with tomentose ones. *Tecoma stans angustata* Rehder¹ (*Stenolobium incisum* Rose & Standl.) is a form common in northeastern Mexico and the adjacent United States in which the leaflets are unusually narrow and incised-serrate.

11. *GODMANIA* Hemsl. Diag. Pl. Mex. 35. 1879.

One other species has been described from Brazil.

1. *Godmania aesculifolia* (H. B. K.) Standl.

Bignonia aesculifolia H. B. K. Nov. Gen. & Sp. 3: 140. 1818.

¹ Mitt. Deutsch. Dendr. Ges. 1915: 227. 1915.

Tecoma fuscata DC. Prodr. 9: 218. 1845.

Godmania macrocarpa Hemsl. Diag. Pl. Mex. 35. 1879.

Guerrero to Chiapas. Central America and Venezuela; type collected near the city of Panama.

Tree, 4.5 to 8 meters high; leaves opposite, long-petiolate, digitately 5 to 9-foliolate, the leaflets obovate or oblanceolate-oblong, 6 to 17 cm. long, usually acuminate, acute at base, petiolulate, entire, pubescent or glabrate beneath; flowers in dense axillary corymbs; calyx broadly campanulate, 5-dentate; corolla yellow, with brownish lines, about 1 cm. long, campanulate, puberulent outside; stamens 4; capsule slender-cylindric, sometimes 90 cm. long, costate; seeds broadly winged. "Roble" (Oaxaca); "cacho de toro" (Chiapas); "corteza de chivo" (Costa Rica), "cortez blanco" (El Salvador).

12. *TABEBUIA* Gomes, Obs. Bot. 2: 7. 1803.

Trees; leaves opposite, long-petiolate, digitately 5 or 7-foliolate, the leaflets entire or toothed; flowers large, in terminal cymes or panicles; calyx tubular or campanulate, closed in bud, variously cleft or toothed in anthesis; corolla tube ampliate, the limb somewhat bilabiate; stamens 4; capsule slender-cylindric, subterete; seeds broadly winged.

The trees of this genus are very showy when in flower. They usually blossom when leafless. The name "guayacán" is said to be employed in Mexico for one or more of the species.

Calyx lepidote, 1.5 cm. long or larger; flowers purple or pink. 1. *T. pentaphylla*.
Calyx densely pubescent or tomentose, at least at first, 1 cm. long or less or, if larger, the flowers yellow.

Flowers (yellow) in large pyramidal panicles. 2. *T. donnell-smithii*.

Flowers in small, dense, usually headlike clusters.

Calyx covered with a fine close whitish tomentum; corolla pink or purple.

3. *T. palmeri*.

Calyx covered with long, short-barbate, fulvous or brown hairs; corolla yellow. 4. *T. chrysantha*.

1. *Tabebuia pentaphylla* (L.) Hemsl. Biol. Centr. Amer. Bot. 2: 495. 1882.

Bignonia leucoxydon L. Sp. Pl. 624. 1753. Not *Tabebuia leucoxydon* DC. 1845.

Bignonia pentaphylla L. Sp. Pl. ed. 2. 870. 1763.

Tecoma pentaphylla Juss. Gen. Pl. 139. 1789.

Tecoma leucoxydon Mart.; DC. Prodr. 9: 219. 1845.

Tamaulipas to Sinaloa, Oaxaca, and Veracruz. West Indies; Central America to Venezuela.

Shrub or tree, 2 to 20 meters high; leaflets 5, long-petiolulate, elliptic-oblong to elliptic or oblong-ovate, 20 cm. long or less, acute or acuminate, rounded to acute at base, entire, finely lepidote; flowers in short lax few-flowered corymbs; corolla 7 to 10 cm. long; fruit 20 to 35 cm. long or larger, about 12 mm. thick. "Maculiz," "maculiz prieto" (Tabasco); "palo yugo" (Michoacán, Guerrero); "roble" (San Luis Potosí, Guerrero); "roble blanco" (Oaxaca, San Luis Potosí, Cuba, Costa Rica, Porto Rico); "palo de rosa" (Tamaulipas, Oaxaca); "maquile" (Ramírez); "maquil" (Oaxaca); "amapola" (Sinaloa); "roble colorado" (El Salvador); "mano de león" (Honduras); "maquilizo" (Guatemala, Honduras); "roble de yugo," "palo blanco," "leño blanco" (Cuba); "amapa rosa" (Nayarit); "rosa morada" (Colima); "maquiligua," "maquiliguat" (El Salvador).

This is an important timber tree in some parts of Mexico and Central America, and furnishes wood of excellent quality for house building, cabinet work, wagons, oars, and other purposes. In Europe the wood has been employed as a substitute for boxwood in engraving. In Cuba the plant is considered an antidote for poisoning by manchineel (*Hippomane mancinella*), and it has been used in some regions (the decoction, taken internally) as a remedy for snake bites. The powdered bark and leaves were formerly used in the Antilles as a febrifuge.

When in flower, *Tabebuia pentaphylla* is one of the most showy and most beautiful of American trees and an extensive stand of them is a sight long to be remembered. The blossoms exhibit great variation in color, ranging from nearly white to deep purple-pink. The color effect produced is strikingly like that seen in Japanese cherries.

Specimens from Central America identified as *Couralialia rosea* (Bertol.) Donn. Smith do not appear to differ from *Tabebuia pentaphylla*.

2. *Tabebuia donnell-smithii* Rose, Bot. Gaz. 17: 418. pl. 26. 1892.

Colima. Guatemala and El Salvador; type from Cuyuta, Guatemala.

Tree, 15 to 25 meters high, the trunk often 1.2 meters in diameter; leaflets 5 or 7, long-petiolulate, oblong-elliptic, 25 cm. long or less, acuminate, rounded or subcordate at base, entire or sinuate-serrate, glabrate; panicles about 20 cm. long; calyx about 1.5 cm. long; corolla 4.5 to 5 cm. long; fruit 20 to 30 cm. long, 2.5 cm. wide, longitudinally ridged and irregularly tuberculate. "Primavera" (Colima); "cortez," "cortez blanco" (El Salvador).

The wood is exported from Mexico for veneering and cabinet work, and is reported to be known in trade as "white mahogany."

3. *Tabebuia palmeri* Rose, Contr. U. S. Nat. Herb. 1: 109. pl. 11. 1891.

Sonora to Guerrero; type from Alamos, Sonora.

Tree, 5 to 20 meters high; leaflets 5, long-petiolulate, elliptic-oblong to ovate-elliptic, 14 cm. long or less, acuminate, rounded at base, entire, densely pubescent or glabrate; calyx 5 to 6 mm. long; corolla 6.5 to 8 cm. long; fruit about 35 cm. long and 1.5 cm. thick, smooth. "Amapa" (Sonora, Sinaloa); "roble" (Guerrero); "amapa prieta," "amapa rosa" (Sinaloa).

The wood is said to be brown, with red lines, and very handsome, heavy, rather hard, resistant, taking a good polish, and durable when exposed to moisture. It is much used locally for building purposes and for cabinet work. A violet ink is said to be made from it.

4. *Tabebuia chrysantha* (Jacq.) Nicholson, Dict. Gard. 4: 1. 1887.

Bignonia chrysantha Jacq. Pl. Hort. Schoenbr. 2: 45. pl. 211. 1797.

?*Tecoma mexicana* Mart.; DC. Prodr. 9: 218. 1845.

Tecoma chrysantha DC. Prodr. 9: 221. 1845.

?*Tabebuia mexicana* Hemsl. Biol. Centr. Amer. Bot. 2: 495. 1882.

Tecoma palmeri Kränzlein, Repert. Sp. Nov. Fedde 17: 220. 1921.

Sonora to Chiapas. Central America to Venezuela; type from Caracas, Venezuela.

Small or large tree with scaly bark; leaflets 5, broadly obovate to elliptic-oblong, 18 cm. long or less, abruptly acuminate, rounded or subcordate at base, entire, stellate-pubescent or glabrate; calyx about 1 cm. long; corolla 5 to 6.5 cm. long; fruit 20 to 30 cm. long or larger, 12 to 15 mm. thick, smooth or tuberculate, stellate-tomentose or glabrate. "Verdecillo" (Michoacán, Guerrero); "amapa," "amapa prieta" (Sinaloa); "roble" (Guerrero); "guayacán," "corteza amarilla" (Costa Rica); "cortez," "cortez amarillo," "cortez coyote," "cortez negro" (El Salvador).

The flowers are sweet-scented. The wood is blackish and very hard.

13. **ASTIANTHUS** Don, Edinburgh Phil. Journ. 9: 262. 1823.

The genus consists of a single species.

1. **Astianthus viminalis** (H. B. K.) Baill. Hist. Pl. 10: 44. 1888.

Bignonia viminalis H. B. K. Nov. Gen. & Sp. 3: 132. 1819.

Astianthus longifolius Don, Edinburgh Phil. Journ. 9: 262. 1823.

Tecoma viminalis Hemsl. Biol. Centr. Amer. Bot. 2: 497. 1882.

Colima to Oaxaca, Puebla, and Veracruz; type collected between Mexcala and Estola, Guerrero. Guatemala.

Tree, sometimes 15 meters high, glabrous; bark gray or whitish, fissured; leaves mostly ternate, linear, 20 to 30 cm. long, attenuate to each end, entire; flowers yellow, in loose paniced cymes; calyx campanulate, 1 cm. long, 5-dentate; corolla funnelform, 5.5 to 6 cm. long, the lobes erose-dentate and somewhat crispate; fruit linear, 8 to 12 cm. long, 8 mm. broad, compressed, smooth or nearly so; seeds small, with broad thin white wings. "Ahuejote" (Oaxaca, etc.); "palo de agua," "flor de agua," "axochitl" (Oaxaca).

The tree usually grows along streams.

14. **CHILOPSIS** Don, Edinburgh Phil. Journ. 9: 261. 1823.

A single species is known.

1. **Chilopsis linearis** (Cav.) Sweet, Hort. Brit. 283. 1827.

Bignonia linearis Cav. Icon. Pl. 3: 35. *pl.* 269. 1794.

Chilopsis saligna Don, Edinburgh Phil. Journ. 9: 261. 1823.

Baja California and Sonora to Tamaulipas, Zacatecas, and Durango. Western Texas to southern California.

Slender shrub or tree, sometimes 9 meters high, with a trunk 30 cm. in diameter, the trunk short, the bark thin, irregularly ridged, scaly; leaves opposite and alternate, linear, 10 to 30 cm. long, attenuate to each end, entire, pubescent or glabrous; flowers purplish or white, in terminal racemes or narrow panicles; calyx bilabiate, 5-dentate; corolla 2.5 to 3.5 cm. long, somewhat bilabiate, 5-lobate; stamens 4; fruit linear, 10 to 30 cm. long, about 6 mm. thick, subterete, smooth; seeds long-hairy; wood soft, weak, close-grained, dark brown, its specific gravity about 0.59. "Mimbre" (Zacatecas, Chihuahua, Nuevo León, Durango).

The tree grows most commonly along arroyos. It is often planted because of its showy sweet-scented flowers. In the United States it is known as "desert willow" or "flowering willow," the leaves bearing a strong resemblance to those of some species of willow (*Salix*). The wood is sometimes used for fence posts and the tough slender branches for making baskets. A decoction of the flowers is employed locally for coughs and as a stimulant in cardiac diseases, and the dried flowers are often sold in the markets for these purposes.

15. **AMPHITECNA** Miers, Trans. Linn. Soc. Bot. 26: 163. 1868.1. **Amphitecna macrophylla** (Seem.) Miers; Baill. Rev. Hort. 1882: 465. 1882.

Crescentia macrophylla Seem. Kew Journ. Bot. 6: 274. 1854.

Veracruz and Tabasco; type from Teapa, Tabasco. Guatemala.

Shrub or small tree, glabrous; leaves alternate, borne at the ends of the branches, oblanceolate or oblong-oblanceolate, 40 to 75 cm. long, acute or acuminate, long-attenuate to the base, sessile or nearly so, entire; flowers long-pedicellate, fasciculate on old wood; calyx closed in bud, splitting in anthesis; corolla funnelform-campanulate, greenish, about 5 cm. long; fruit baccate, oval or ellipsoid, 5 cm. or more in diameter. "Huiro de montaña" (Tabasco, *Rovirosa*).

16. *PARMENTIERA* DC. Prodr. 9: 244. 1845.

Trees, usually armed with spines; leaves alternate or subopposite, mostly trifoliolate; flowers large, greenish, pedicellate, solitary or fasciculate on old wood; calyx closed in bud, in anthesis cleft along one side and spathe-like; corolla tube dilated and campanulate, curved, the limb somewhat bilabiate, 5-lobate; stamens 4; ovary 2-celled; fruit elongate, terete, indehiscent, with fleshy pericarp, smooth or costate; seeds small, numerous, not winged.

One other species is known, *P. cereifera* Seem., the candle-tree of Panama.

Fruit short and thick, costate; leaflets mostly acute and entire. 1. *P. edulis*.
Fruit long and slender, smooth or nearly so; leaflets usually very obtuse and often toothed. 2. *P. aculeata*.

1. *Parmentiera edulis* DC. Prodr. 9: 244. 1845.

?*Crescentia edulis* Desv. Journ. de Bot. Desv. 4: 113. 1814.

?*Parmentiera foliolosa* Miers, Trans. Linn. Soc. Bot. 26: 166. 1870.

?*Parmentiera lanceolata* Miers, Trans. Linn. Soc. Bot. 26: 167. 1870.

Sinaloa to Tamaulipas, Campeche, and Oaxaca; type from Yautepec, Morelos. Guatemala and El Salvador.

Tree, 4.5 to 9 meters high, the branches armed with short stout incurved spines; leaves glabrous, long-petiolate, the petiole naked or narrowly winged, the leaflets elliptic, ovate, or obovate, 3 to 8.5 cm. long, acute or abruptly attenuate at base; corolla about 7 cm. long; fruit 10 to 16 cm. long and 2 cm. thick or larger. "Chote" (Tamaulipas, San Luis Potosí); "cuajilote," "huajilote," "cuachilote," "guajilote" (Oaxaca, Tamaulipas, Veracruz, Jalisco, Morelos, Campeche, Sinaloa, Costa Rica, El Salvador, Guatemala; from the Nahuatl *cuau-xilotl*); "gueto-xiga" (Oaxaca, Zapotec, *Reko*).

The tree is often cultivated for its shade and fruit. The fruit is sweet and edible, and is eaten either raw or cooked. It is sometimes made into pickles or preserves and also roasted in ashes. Stock of all kinds are fond of it. It is considered a good remedy for colds; the roots are used as a diuretic, especially in the treatment of dropsy, and the juice of the leaves was formerly, at least, dropped into the ears as a cure for deafness. The flowers are greenish white or greenish yellow, and the fruit green tinged with yellow.

The name *Crescentia edulis* Desv. has no connection with *Parmentiera edulis* DC., and it is not certain that Desvau's name relates to the present plant. He describes the leaves as simple, but his description of the fruit points to *Parmentiera edulis*.

2. *Parmentiera aculeata* (H. B. K.) Seem. Bot. Voy. Herald 183. 1854.

Crescentia aculeata H. B. K. Nov. Gen. & Sp. 3: 158. 1818.

Colima, Campeche, and Yucatán; type from Campeche.

Shrub or tree, 3.5 to 7.5 meters high, the branches armed with stout spines; leaves long-petiolate, the petioles not winged, the leaflets suborbicular to obovate, 1 to 3 cm. long, abruptly decurrent at base, puberulent or glabrous; calyx 2 cm. long; fruit 18 to 25 cm. long, about 1 cm. thick. "Xkat-cunc," "kaat," "pepina" (Yucatán).

The flowers are said to be green. This species has been reported from Yucatán as *P. cereifera* Seem.

17. *CRESCENTIA* L. Sp. Pl. 626. 1753.

Unarmed trees; leaves alternate or fasciculate, simple or trifoliolate (rarely 5-foliolate); flowers large, yellowish, solitary or fasciculate along the trunk and larger branches; calyx closed in bud, in anthesis campanulate and irregularly cleft; corolla tube campanulate, the limb oblique, 5-lobate; stamens 4; fruit large, oval or globose, indehiscent, the pericarp hard and shell-like; seeds numerous, exalate, imbedded in pulp.

Leaves simple-----	1. <i>C. cujete</i> .
Leaves trifoliolate-----	2. <i>C. alata</i> .

1. *Crescentia cujete* L. Sp. Pl. 626. 1753.

Guerrero to Chiapas, Yucatán, Veraacruz, and Tamaulipas. Southern Florida, West Indies, and Central and South America; cultivated in the Old World tropics.

Tree, sometimes 10 meters high, with a trunk 20 cm. in diameter, the branches long and often drooping, the bark thin, close, gray; leaves persistent, oblanceolate to spatulate, 5 to 16 cm. long, acute to rounded at apex, attenuate to base, entire, glabrous or puberulent beneath; corolla yellowish marked with purple, 5 to 8 cm. long, the lobes usually crispate; fruits commonly oval, 15 to 30 cm. long; wood soft, close-grained, flexible. "Güiro," "huas" "lunch" (Yucatán); "jícara" or "jícara" (the former the tree, the latter the fruit; Tabasco, Oaxaca, Guerrero, Yucatán, El Salvador, Nicaragua); "cujete" (Yucatán); "cirián" (Guerrero, Palmer); "tecomate," (Oaxaca); "cuautecomate"; "tecomatl"; "árbol de las calabazas" "guaje" (Herrera); "pog" (Oaxaca, Totonac, Ramírez); "morro" (Guatemala); "calabazo," "güiro totumo" (Sessé & Mociño); "güira cimarrona" (Cuba, El Salvador); "güira" (Cuba); "calabacero," "guacal" (Costa Rica); "palo de turtumas," "calabazo," "calabaza," "palo de calabaza" (Panama); "morro guacalero" (Guatemala); "mate" (Colombia, Ecuador); "totumo" (Colombia, El Salvador); "cutueo" (El Salvador); "totuma" (Cuba); "jícara de cuchara," "jícara de guacal," "huacal" (El Salvador).

The calabash tree is a common plant of southern Mexico, noteworthy because of its large fruits, many of which are borne close to the trunk. The seeds are sometimes cooked and eaten. The pulp is much used in domestic medicine and is said to have emollient, expectorant, laxative, and astringent properties. It is employed chiefly as a healing agent for wounds and as a remedy for disturbances of the respiratory system. The fruit is often eaten by cattle during the dry season, but it is said that it often produces abortion. Seemann states that the sap was employed in Panama for dyeing silk black. The wood is of little value, but is often used for various purposes. The hard shell of the fruit, which resembles a gourd, has been used in Mexico from ancient times for making "jícara" or drinking cups, which are often ornamented by carving and painting. Vessels thus made are sufficiently substantial for moderate use over fire.

2. *Crescentia alata* H. B. K. Nov. Gen. & Sp. 3: 158. 1819.

Parmentiera alata Miers, Trans. Linn. Soc. Bot. 26: 166. 1870.

Baja California and Sonora to Chiapas; Morelos and Veraacruz (probably cultivated); type from Acapulco, Guerrero. Central America; cultivated in Guam and the Philippines, and probably elsewhere.

Tree, 5 to 14 meters high, with gray bark and long spreading irregular branches; leaves long-petiolate, the petiole broadly winged and resembling a leaflet, the leaflets usually 3 but sometimes 5, linear to obovate, 2 to 9 cm. long, obtuse or rounded at apex, entire, coriaceous, glabrous; corolla about 6 cm. long, greenish yellow striped with brown; fruit globose or ovoid, 5 to 12 cm. in diameter or often much larger. "Cirián" (Michoacán, Guerrero); "tecomate" (Sinaloa); "morro" (Chiapas, Guatemala); "ayal" or "ayale" (Sonora, Sinaloa); "cuautecomate" (Michoacán); "huajericián," "tecomatl," "cuautecomatl" (Ramírez); "cuastecomatl" "güiro," "guaje cirián" (Nueva Farm. Mex.); "huiro" (Ramírez); "cuira"; "jayacaste" (Sinaloa); "raspa-guacal" (Costa Rica); "hoja cruz" (Philippines); "jícara" (Guam); "morrito," "cutueo," "cuchara" (El Salvador).

The wood is used locally for making wagons and other articles. The flowers have a strong unpleasant odor. The fruit is employed in domestic medicine like that of *C. cujete*, and the roots also are used medicinally. The pulp is sweet, since it contains much sugar, and is said to be fermented sometimes to obtain alcohol.

A decoction of the leaves is reported to be used for promoting the growth of the hair. In Nicaragua a cooling drink is made from the seeds. The shells of the fruits are much used for making cups, as in the case of *Crescentia cujete*.

The earliest account of this species and of *C. cujete* is that given by Oviedo (Lib. VIII, Cap. IV), part of which is translated below. The leaves which resemble a cross are, of course, those of *C. alata*, in which the resemblance is very striking.

"The *Higüero* is a large tree like the mulberry trees of Castile. It is a kind of calabash, round or somewhat elongate; and the round ones are very round, of which the Indians make cups or other vessels, for drinking. The wood is strong and good for chairs and other purposes. It is flexible and strong, and when worked resembles in grain pomegranate or hawthorn. The leaf of this tree is long and narrow, and the widest part is at the tip, from which it narrows to the base where it is attached, as I sketch it here. In times of scarcity the Indians eat this fruit. I refer to the interior—which is like a green calabash. When dried and the interior removed, to make a vessel of the *higüera*, the vessel has a luster like a gourd, and indeed it is a gourd of the sort I have described. These fruits or calabashes are so large that the larger ones are like a water-jar that holds a gallon of water, and some are no larger than a closed fist; and thus they make of them vessels of the size that the dimensions permit. These trees are common in Hispaniola and all the islands of these Indies and in the Spanish Main. * * * I may state that the leaf of the *higüero* is long and narrow, and the widest part is near the tip, from which it narrows to the base where it is attached, as I said above, and this is seen plainly in plate 3, figure 3. But there are other *higüeros* in Tierra-Firme which are different, not in the fruit or in any other particular I have mentioned, but only in the leaves, as shown in plate 3, figure 4, each leaf in the form of a cross, as I have drawn it; and this seems to me a very noteworthy thing, in which appears a testimony of the cross, a thing of which these people can not have been ignorant. These *higüero* trees, which have the leaves all formed like crosses, I have seen in the Province of Nicaragua, especially in Negrando, where lies the city of León, and in other parts of that country; and marveling upon the leaves, I gathered some to show in Spain, as I did show them, and I still have some in my possession. But in Nicaragua, where as I have said there are many of these trees, they call the tree *guacal*. The precious vessels of the *higüeros* are found in Darién and in the Gulf of Urabá, with handles of gold, and so handsome that the most powerful king might drink from them without reproach. And these come through the channels of trade from the great river of San Juan, which empties into the Gulf of Urabá."

DOUBTFUL GENERA.

LUNDIA SCHUMANNIANA Kränzlein, Repert. Sp. Nov. Fedde 17: 120. 1921. Described from Campeche, but according to the author the locality is doubtful.

151. GESNERIACEAE. Gesneria Family.

Shrubs or usually herbs, often epiphytic or scandent; leaves opposite or verticillate, simple, entire or toothed; flowers usually showy, axillary or terminal, solitary, umbellate, or cymose, perfect, commonly irregular; calyx inferior or adnate to the ovary, the lobes entire or dentate; corolla gamopetalous, the tube elongate, ventricose, straight or curved, the limb usually bilabiate, 5-lobate; stamens 4 or 2, some of them frequently sterile, the anthers 2-celled; disk present at base of ovary; style simple, the stigma capitate or bilamellate; fruit capsular or rarely fleshy, 1-celled; seeds numerous.

Numerous herbaceous plants of this family, representing several genera, occur in Mexico.

Ovary wholly or partly inferior.

Ovary partly inferior; calyx cleft to the ovary..... 1. **KOHLERIA**.
Ovary wholly inferior; calyx tube developed.

Lobes of the calyx as long as the tube, narrow and acute; corolla tube only slightly exceeding the calyx; flowers solitary.... 2. **SOLENOPHORA**.

Lobes of the calyx much shorter than the tube; corolla tube much exceeding the calyx; flowers umbellate..... 3. **HIPPODAMIA**.

Ovary superior.

Disk ringlike, not separated into glands..... 4. **BESLERIA**.

Disk separated into several glands, but only one of them usually well developed.

Filaments free or nearly so..... 5. **DRYMONIA**.

Filaments united below into a tube.

Anthers free..... 6. **ALLOPECTUS**.

Anthers coherent..... 7. **COLUMNEA**.

1. **KOHLERIA** Regel, Flora 31: 250. 1848.

Plants herbaceous or suffrutescens; leaves opposite or verticillate; flowers usually red, axillary or in terminal leafy racemes; calyx tube adnate to the ovary, the limb 5-lobate; corolla tube ventricose, the lobes subequal, short; fruit a bivalvate capsule.

Flowers in terminal leafy racemes, the leaves of the inflorescence much reduced; stigma deeply bilobate.

Calyx lobes obtuse, the pubescence brown or red, loose and spreading.

1. **K. spicata**.

Calyx lobes acute, the pubescence whitish, appressed..... 2. **K. longifolia**.

Flowers in axillary long-pedunculate umbels, or the peduncles rarely 1-flowered, the leaves of the inflorescence little if at all reduced; stigma only shallowly lobate.

Leaves glabrous on the upper surface.

Branches appressed-pilose 3. **K. fruticosa**.

Branches glabrous..... 4. **K. viminalis**.

Leaves appressed-pilose on the upper surface.

Calyx lobes in anthesis equaling or shorter than the campanulate tube.

5. **K. deppeana**.

Calyx lobes in anthesis usually twice as long as the tube, if shorter the tube narrowly turbinate.

Leaves glabrous beneath except along the veins..... 6. **K. martensii**.

Leaves densely appressed-pilose beneath..... 7. **K. elegans**.

1. **Kohleria spicata** (H. B. K.) Hanst. Linnaea 29: 520. 1858.

Gesneria spicata H. B. K. Nov. Gen. & Sp. 2: 393. pl. 188. 1817.

Gesneria schiedeana Hook. in Curtis's Bot. Mag. pl. 4152. 1845.

Isoloma spicatum Decaisne, Rev. Hort. 1848: 465. 1848.

Kohleria schiedeana Hanst. Linnaea 29: 518. 1858.

Isoloma schideanum Hemsl. Biol. Centr. Amer. Bot. 2: 479. 1882.

Veracruz and Oaxaca. Guatemala to Venezuela; type from Colombia.

Plants herbaceous or suffrutescens, often epiphytic, the stems villous-hirsute with appressed or spreading hairs; leaves mostly ternate, short-petiolate, lance-oblong or ovate-oblong, 7 to 15 cm. long, acute or acuminate, obtuse to attenuate at base, crenate, scabrous above, villous-sericeous beneath; corolla scarlet, 18 to 20 mm. long, densely villous.

2. **Kohleria longifolia** (Lindl.) Hanst. Linnaea 29: 525. 1858.

Gesneria longifolia Lindl. in Edwards, Bot. Reg. 1841: Misc. 92. 1841.

Isoloma longifolium Decaisne, Rev. Hort. 1848: 465. 1848.

Kohleria chiapensis T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 66. 1914.

Chiapas. Guatemala (type locality) and El Salvador.

Plants chiefly herbaceous, the stems appressed-villous with white hairs; leaves opposite or ternate, short-petiolate, oblong-lanceolate, 8 to 16 cm. long, acuminate, obtuse to attenuate at base, crenate, villous-sericeous, more densely so beneath; corolla about 18 mm. long, villous. "Digital montés," "diente de perro" (El Salvador).

3. *Kohleria fruticosa* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 67. 1914.

Type from Cerro del Boquerón, Chiapas.

Plants suffrutescent; leaves opposite, short-petiolate, oblong-lanceolate, 5 to 8.5 cm. long, acuminate, obtuse or acute at base, serrulate, ciliate, sparsely appressed-villous beneath; peduncles 1-flowered, equaling or shorter than the leaves; calyx lobes lance-linear, fully twice as long as the tube; corolla 3 cm. long.

4. *Kohleria viminalis* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 194. 1915.

Type from Finca Irlanda, Chiapas.

Shrub; leaves short-petiolate, ovate-lanceolate, 3 to 6 cm. long, acuminate, cuneate at base, denticulate, hirsutulous beneath along the veins; peduncles 1-flowered, 7 cm. long; calyx lobes linear-lanceolate, 1 cm. long; corolla red, 3 cm. long, pubescent.

Not seen by the writer.

5. *Kohleria deppeana* (Schlecht. & Cham.) Fritsch in Engl. & Prantl, Pflanzenfam. 4^{3b}: 174. 1894.

Gesneria deppeana Schlecht. & Cham. Linnaea 5: 110. 1830.

Gesneria lasiantha Zucc. Pl. Nov. 1: 300. 1839.

Gesneria elongata Mart. & Gal. Bull. Acad. Brux. 9²: 32. 1842. Not *G. elongata* H. B. K. 1817.

Veracruz, Oaxaca, and Guerrero; reported from Morelos and Chiapas; type from Jalapa, Veracruz. Guatemala.

Plants herbaceous or suffrutescent; leaves mostly opposite, on long or short petioles, oblong-lanceolate or oblong-ovate, 6 to 17 cm. long, acuminate, obtuse or acute at base, crenate or serrate, villous-sericeous; peduncles equaling or shorter than the leaves, usually 3 or 4-flowered, the pedicels shorter than the peduncles; corolla bright red, about 2.8 cm. long, villous or puberulent.

6. *Kohleria martensii* Fritsch, Bot. Jahrb. Engler 50: 428. 1913.

Gesneria triflora Mart. & Gal. Bull. Acad. Brux. 9²: 33. 1842. Not *Kohleria triflora* Regel, 1848.

Veracruz; type from Mirador.

Plants slender, suffrutescent, the stems appressed-villous or glabrate; leaves opposite, short-petiolate, lance-oblong or ovate-lanceolate, acuminate, acute at base, crenate-serrate, sparsely appressed-pilosulous above; inflorescences longer than the leaves, mostly 3-flowered, the pedicels equaling or shorter than the peduncles; calyx lobes slightly shorter than the narrowly turbinate tube; corolla nearly 3 cm. long.

7. *Kohleria elegans* (Decaisne) Loesener, Bull. Herb. Boiss. 7: 574. 1899.

Moussonia elegans Decaisne; Planch. Fl. Serr. Jard. 5: pl. 189. 1849.

?*Moussonia papillosa* Hanst. Linnaea 34: 288. 1865-66.

Isoloma jaliscanum S. Wats. Proc. Amer. Acad. 25: 159. 1890.

Kohleria collina T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 66. 1914.

Kohleria pedunculata T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 67. 1914.

Tepic to Chiapas. Type from Guatemala.

Plants herbaceous or suffrutescent, the stems villous with mostly spreading hairs; leaves opposite, on short or long petioles, ovate-oblong, 5 to 12 cm. long, acuminate, obtuse or rounded at base, serrate or crenate, usually scabrous above and villous-sericeous beneath; inflorescences equaling or shorter than the leaves, 1 to 4-flowered, the pedicels commonly longer than the peduncles; corolla 3 to 3.5 cm. long.

EXCLUDED SPECIES.

KOHLERIA SAXICOLA T. S. Brandeg. Univ. Calif. Pub. Bot. 6: 66. 1914.
According to Brandege¹ this is *Diastema rupestre* T. S. Brandeg.

2. *SOLENOPHORA* Benth. Pl. Hartw. 68. 1840.

A single species is known.

1. *Solenophora coccinea* Benth. Pl. Hartw. 68. 1840.

Type from mountains of Chinantla, Oaxaca.

Shrub, 1 to 2 meters high, the branches minutely puberulent; leaves opposite, petiolate, ovate, 15 to 20 cm. long, acuminate, narrowed and oblique at base, duplicate-serrate; pedicels axillary, solitary, 7.5 to 10 cm. long; flowers scarlet, about 6 cm. long; calyx adnate to the ovary below, the lobes narrowly lanceolate, denticulate; corolla glabrous, the lobes fimbriate-crenate; capsule 5-angulate.

3. *HIPPODAMIA* Decaisne, Rev. Hort. III. 2: 464. 1848.

Plants suffrutescens; leaves opposite, large; flowers orange or whitish, umbellate; calyx adnate to the ovary below, the lobes short and broad; corolla pubescent, the tube elongate, the lobes lacinate.

Corolla whitish. Umbels sessile or nearly so.....1. *H. obscura*.

Corolla orange.

Umbels subsessile.....2. *H. endlicheriana*.

Umbels pedunculate.....3. *H. insignis*.

1. *Hippodamia obscura* (Hanst.) Fritsch in Engl. & Prantl, Pflanzenfam. 4^{3b}: 183. 1894.

Solenophora obscura Hanst. Linnaea 34: 315. 1865-66.

Type from Chinantla, Oaxaca.

Stems hirtous; leaves serrate, sparsely scaberulous; pedicels shorter than the calyx, the latter villous, the lobes acute, serrate.

2. *Hippodamia endlicheriana* (Heller) Fritsch in Engl. & Prantl, Pflanzenfam. 4^{3b}: 183. 1894.

Arctocalyx endlicherianus Heller; Fenzl in Otto & Dietr. Allg. Gartenz. 16: 307. 1848.

Solenophora endlicheriana Hanst. Linnaea 34: 314. 1865-66.

Type from Mirador, Veracruz.

Stems suffrutescens, long-hirsute; leaves long-petiolate, broadly elliptic, 45 cm. long or less, acuminate, duplicate-serrate, long-hirsute; pedicels equaling or shorter than the calyx; calyx inflated, hirsute, the lobes rounded-ovate, crenulate; corolla 6.5 to 7.5 cm. long, hirsute.

3. *Hippodamia insignis* (Mart. & Gal.) Decaisne, Rev. Hort. 1848: 464. 1848.

Besleria insignis Mart. & Gal. Bull. Acad. Brux. 9²: 37. 1842.

Solenophora insignis Hanst. Linnaea 34: 314. 1865-66.

Type from mountains of Oaxaca, altitude 1,200 meters. Costa Rica.

Stems hirsute; leaves obliquely ovate-lanceolate or elliptic, acuminate, duplicate-serrate, short-hirsute above, pubescent beneath along the veins but elsewhere glabrous; pedicels as long as the calyx; calyx hirsute, the lobes rounded-ovate, serrulate; corolla sparsely hirsute.

4. *BESLERIA* L. Sp. Pl. 619. 1753.

Plants suffrutescens; leaves opposite, thin; inflorescence axillary, the flowers usually yellow; calyx inferior, campanulate or inflated, shallowly or deeply

¹ Univ. Calif. Publ. Bot. 6: 193. 1915.

5-lobate; corolla tube cylindric, straight or oblique, slightly ampliate above; disk annular; fruit usually globose, indehiscent.

Calyx large, equaling the corolla.

Calyx hirsute.....1. *B. cyrtanthemum*.

Calyx appressed-pubescent.....2. *B. deflexa*.

Calyx small, shorter than the corolla.

Leaves hirsute.....3. *B. hirsuta*.

Leaves glabrous or with appressed hairs.

Leaves glabrous beneath.....4. *B. glabra*.

Leaves with sparse appressed hairs beneath.....5. *B. chiapensis*.

1. *Besleria cyrtanthemum* Hanst. *Linnaea* 34: 321. 1865-66.

Cyrtanthemum hirsutum Oerst. *Dansk. Vid. Selsk. Skrivt.* 5: 130. *pl.* 20, *f.* 20-31. 1861.

Type from Oaxaca.

Stems hirsute-tomentose above; leaves long-petiolate, obliquely oblong-elliptic, 18 to 23 cm. long, short-acuminate, acute at base, obsoletely serrate, pilose above, pilosulous beneath; pedicels shorter than the calyx; posterior calyx lobe nearly 2.5 cm. long; corolla glabrous.

2. *Besleria deflexa* (Oerst.) Hanst. *Linnaea* 34: 321. 1865-66.

Cyrtanthemum deflexum Oerst. *Dansk. Vid. Selsk. Skrivt.* 5: 130. *pl.* 20, *f.* 32-39. 1861.

Type from Oaxaca.

Stems hirsute above; leaves elongate-oblong or subfalcate-elliptic, short-attenuate, suboblique at base, entire, minutely appressed-pilose above, glabrate beneath; peduncles 4 to 8 mm. long; corolla glabrous.

3. *Besleria hirsuta* (Oerst.) Hanst. *Linnaea* 34: 326. 1865-66.

Gasteranthopsis hirsuta Oerst. *Dansk. Vid. Selsk. Skrivt.* 5: 129. *pl.* 10, *f.* 9-13. 1861.

Type material from Tepinapa and Chinantla, Oaxaca.

Stems hirsute above; leaves petiolate, elongate-oblong, 20 cm. long, acuminate, attenuate at base, obsoletely serrate; peduncles much shorter than the petioles; calyx lobes obtuse.

4. *Besleria glabra* Hanst. *Linnaea* 34: 325. 1865-66.

Gasteranthopsis glabra Oerst. *Dansk. Vid. Selsk. Skrivt.* 5: 129. *pl.* 10, *f.* 1-8. 1861.

Type from Chinantla, Oaxaca.

Stems glabrous; leaves petiolate, 18 to 23 cm. long, obliquely elliptic-oblong, acute at base; peduncles shorter than the petioles; calyx lobes obtuse; corolla 18 mm. long.

5. *Besleria chiapensis* T. S. Brandeg. *Univ. Calif. Publ. Bot.* 6: 64. 1914.

Oaxaca and Chiapas; type from Finca Mexiquito, Chiapas.

Branches glabrous or appressed-pilose; leaves slender-petiolate, elliptic-oblong, 6 to 13 cm. long, acuminate, acute at base, obscurely serrulate; peduncles about as long as the petioles; corolla red, 2 cm. long.

Perhaps not distinct from *B. glabra*.

5. **DRYMONIA** Mart. *Nov. Gen. & Sp.* 3: 57. 1829.

1. *Drymonia chiapensis* T. S. Brandeg. *Univ. Calif. Publ. Bot.* 6: 64. 1914.

Type from Finca Mexiquito, Chiapas.

Plants scandent, the young branches puberulent; leaves elliptic, 10 to 13 cm. long, acute, cuneate at base, sinuate-dentate, hirsutulous above, paler and pubescent beneath; flowers solitary, the pedicels 15 cm. long; calyx lobes ovate-

cordate, acute, dentate, 18 mm. long; corolla reddish, puberulent at base, 4 cm. long.

Not seen by the writer.

6. **ALLOPECTUS** Mart. Nov. Gen. & Sp. 3: 53. 1829.

Plants suffrutescens, the stems often scandent and rooting; leaves opposite; flowers fasciculate or solitary in the axils; calyx inferior, 5-parted, usually red, the lobes dentate or cristate; corolla usually whitish, the tube cylindric or ventricose; fruit globose or ovoid, dehiscent or indehiscent.

Corolla about 5 cm. long.....1. **A. tetragonus**.

Corolla about 3 cm. long.....2. **A. strigosus**.

1. **Alloplectus tetragonus** (Oerst.) Hanst. Linnaea 34: 368. 1865-66.

Glossoloma tetragonum Oerst. Dansk. Vid. Selsk. Skrivt. 5: 41. pl. 7. 1861.

Chiapas. Central America; type from Turrialba, Costa Rica.

Scandent shrub, the branches villous-hirsute; leaves long-petiolate, elliptic or oblong-elliptic, 15 to 25 cm. long, acuminate, obtuse or acute at base, serrulate, sparsely pilose; pedicels shorter than the petioles; calyx red, 2.5 to 3 cm. long, hirsute, the lobes laciniate-dentate; corolla pink, densely villous-hirsute.

2. **Alloplectus strigosus** (Oerst.) Hanst. Linnaea 34: 374. 1865-66.

Saccoplectus strigosus Oerst. Dansk. Vid. Selsk. Skrivt. V. 5: 118. 1861.

Type material from Chinantla, Tepinapa, and Tintalcingo, Oaxaca.

Stems hirsute-tomentose above, finally glabrous; leaves long-petiolate, obliquely elliptic-oblong, the larger ones 20 to 22 cm. long, acuminate, narrowed at base, puberulent; pedicels 12 mm. long; calyx nearly 2.5 cm. long, the lobes shallowly and remotely serrate, red; corolla puberulent.

DOUBTFUL SPECIES.

ALLOPECTUS GLABER DC. Prodr. 7: 546. 1839. Type from mountains of Mazatlán (Guerrero?). Stems said to be glabrous.

7. **COLUMNNEA** L. Sp. Pl. 638. 1753.

Shrubs, usually scandent and rooting; leaves opposite; flowers usually red or yellowish, solitary or fasciculate in the axils; calyx inferior, 5-parted, the lobes usually entire; corolla tube often gibbous at base, straight or incurved, usually ventricose; fruit commonly baccate and indehiscent.

Corolla yellow, not spotted.....1. **C. flava**.

Corolla red, or yellow spotted with red.

Corolla red, not spotted.....2. **C. erythrophoea**.

Corolla yellowish, with large, dark red spots.....3. **C. schiedeana**.

1. **Columnnea flava** Mart. & Gal. Bull. Acad. Brux. 11²: 39. 1842.

Type from mountains of Oaxaca.

Plants scandent, the branches fulvous-pilose; leaves sessile, oblong-lanceolate, sericeous-villous; peduncles shorter than the leaves; calyx lobes ovate, acute, entire, reddish, hirsute; corolla villous.

2. **Columnnea erythrophoea** Decaisne, Rev. Hort. 39: 172. 1867.

Described from cultivated plants, grown from seeds collected in Chiapas.

Branches fleshy; leaves short-petiolate, lanceolate to elliptic, acuminate, glabrous except beneath along the nerves; calyx deep rose, the segments cordate-acuminate, dentate; corolla 8 cm. long, villous.

3. **Columnnea schiedeana** Schlecht. Linnaea 8: 249. 1833.

Veracruz, Puebla, and Oaxaca; type material from Misantla and Hacienda de la Laguna, Veracruz.

Scandant shrub, the fleshy branches reddish-villous above; leaves short-petiolate, obliquely oblong or lanceolate, 5 to 10 cm. long, acute, very oblique at base, sericeous or somewhat tomentose, especially beneath, often tinged with red; flowers slender-pedicellate; calyx red, the lobes lanceolate or ovate, acuminate, entire or remotely dentate, rounded at base, villosulous; corolla 5.5 to 6 cm. long villous; fruit globose, white.

152. ACANTHACEAE. *Acanthus* Family.

Shrubs or herbs, rarely small trees, the pubescence usually of simple hairs; leaves opposite, mostly entire, commonly marked with linear cystoliths, estipulate; flowers perfect, small or large, usually irregular, bracteate and bibracteolate; calyx inferior, the 5 (rarely 4) segments usually united for less than half their length, often nearly free; corolla gamopetalous, the tube slender or broad, the limb subequally 5-lobate or more commonly bilabiate; perfect stamens 4 or 2, attached to the corolla tube, the fifth stamen (or 2 of the others also) sometimes represented by staminodia; style simple, usually bilobate at apex; fruit capsular, usually stipitate, 2-celled, elastically dehiscent; seeds 2 or several.

A large number of herbaceous plants of the family, some of them belonging to genera not listed here, occur in Mexico.

Fertile stamens 4.

Corolla limb with subequal lobes.

Flowers in large dense terminal spikes furnished with large bracts.

1. **BARLERIA.**

Flowers not spicate.

Anthers 1-celled..... 2. **HOLOGRAPHIS.**

Anthers 2-celled.

Calyx lobes narrow, acute or acuminate, not coriaceous... 3. **RUELLIA.**

Calyx lobes broad, obtuse, coriaceous..... 4. **BRAVAISIA.**

Corolla limb bilabiate.

Flowers in very dense spikes, subtended by large bracts; corolla tube long and slender..... 5. **APHELANDRA.**

Flowers in small interrupted spikes, the bracts small and inconspicuous; corolla tube short, ampliate..... 6. **BERGINIA.**

Fertile stamens 2.

Calyx with 3 segments..... 7. **LOUTERIDIUM.**

Calyx with 4 or 5 segments.

Anther cells parallel, equal, both inserted at the same height upon the filament.

Staminodia (sterile stamens) present.

Flowers in axillary few-flowered cymes... 8. **CHILERANTHEMUM.**

Flowers in terminal, simple or paniculate racemes.

9. **ODONTONEMA.**

Staminodia none.

Corolla lobes widely spreading, longer than the tube; flowers small.

10. **CARLOWRIGHTIA.**

Corolla lobes erect-recurved, often shorter than the tube; flowers large.

11. **ANISACANTHUS.**

Anther cells unequal, inserted at different heights.

Calyx tubular, 5-dentate..... 12. **NEOHALLIA.**

Calyx deeply 5-lobate or 5-parted.

Calyx lobes broad, foliaceous..... 13. **TABASCINA.**

Calyx lobes usually linear or subulate.

Anther cells not mucronate at base..... 14. **JACOBINIA.**

Anther cells mucronate or calcarate at base.

Corolla tube usually ampliate above.....15. **JUSTICIA.**

Corolla tube slender, not or scarcely ampliate.

Corolla lobes abruptly spreading.....16. **SIPHONOGLOSSA.**

Corolla lobes not abruptly spreading, the posterior lip erect or nearly so.....17. **BELOPERONE.**

1. **BARLERIA** L. Sp. Pl. 636. 1753.

1. **Barleria micans** Nees; Benth. Bot. Voy. Sulph. 146. 1844.

Barleria discolor Nees; Benth. Bot. Voy. Sulph. 146. 1844.

Tepec to Morelos, Veracruz, and Chiapas. Guatemala to Colombia; type from Taboga Island, Panama.

Plants herbaceous or fruticose, 1 to 1.5 meters high; leaves ovate to narrowly lanceolate, 10 to 25 cm. long, long-acuminate, attenuate or abruptly decurrent at base, sparsely strigose or hirtellous; flowers in large dense terminal spikes, the bracts large, lance-ovate to broadly ovate, acute or obtuse, strigose and hirsute-ciliate, bluish when dry; calyx lobes very unequal, 2 of them narrow, the other 2 large and resembling the bracts; corolla 5 to 5.5 cm. long, yellow, turning bluish purple when dry, the tube long and slender, the 5 lobes subequal, spreading; stamens 4; seeds 2 in each cell. "Ojo de buey" (Veracruz).

2. **HOLOGRAPHIS** Nees in DC. Prodr. 11: 728. 1847.

Holographis (?) *ilicifolia* T. S. Brandeg.,¹ the only other species assigned to the genus, has not been seen by the writer.

1. **Holographis ehrenbergiana** Nees in DC. Prodr. 11: 728. 1847.

Tamaulipas and San Luis Potosí to Puebla; type from Hacienda de Guadela.

Slender shrub; leaves petiolate, elliptic-oblong to oblong-ovate or broadly ovate, 1 to 3 cm. long, obtuse or rounded at apex, acute or obtuse at base, scaberulous above, whitish-puberulent beneath; flowers axillary, solitary or in few-flowered clusters; calyx 5-parted, the lobes linear-lanceolate, 5 to 6 mm. long; corolla about 1.5 cm. long, puberulent, the tube very short, the throat obconic, the lobes of the limb subequal; stamens 4, the anthers lanate.

3. **RUELLIA** L. Sp. Pl. 634. 1753.

Shrubs or more commonly herbs; leaves entire or serrulate; flowers large, axillary, solitary, fasciculate, or cymose, the bracts usually narrow and inconspicuous; calyx 5-parted or deeply 5-lobate, the segments linear or lanceolate, subequal; corolla tube straight or incurved, abruptly dilated into a campanulate throat, the lobes spreading, subequal, contorted; stamens 4; capsule clavate or oblong-linear, stipitate, the seeds usually 6 or more.

Numerous herbaceous species occur in Mexico.

Corolla contracted at the mouth, the lobes small, 3 mm. long or less.

Corolla glabrous.....1. **R. cupheoides.**

Corolla pilose.....2. **R. sororia.**

Corolla not contracted at the mouth, the lobes large.

Leaves glabrous beneath.

Leaves 1 to 3 cm. long; tube of the corolla shorter than the throat.

3. **R. peninsularis.**

Leaves mostly 4 to 15 cm. long; tube of the corolla equaling or longer than the throat.

Calyx in anthesis 5 mm. long or less; capsule glabrous or nearly so.

4. **R. alboviolacea.**

¹ Zoe 5: 236. 1906.

Calyx in anthesis 8 to 10 mm. long; capsule densely pruinose-puberulent.

5. *R. albiflora*.

Leaves finely or coarsely pubescent beneath.

Corolla lobes 5 mm. long or less.....6. *R. albicaulis*.

Corolla lobes 1 cm. long or larger.

Calyx lobes 3 to 6 mm. wide, lanceolate or linear-lanceolate.

Corolla throat not saccate below, the tube equaling or longer than the throat.....7. *R. speciosa*.

Corolla throat strongly saccate at base, the tube much shorter than the throat.

Leaves broadly deltoid-ovate; corolla glabrous outside.

8. *R. bourgaei*.

Leaves lance-oblong; corolla pilose outside.....9. *R. palmeri*.

Calyx lobes less than 2 mm. wide; linear.

Flowers in large cymes; calyx about 5 cm. long.....10. *R. jaliscana*.

Flowers mostly solitary; calyx 2.5 cm. long or less.

Pubescence of the branches eglandular; corolla white.

11. *R. leucantha*.

Pubescence of the branches of gland-tipped hairs; corolla purple or purplish.

Pubescence of the leaves of stellate hairs.

12. *R. hirsuto-glandulosa*.

Pubescence of the leaves of simple hairs.....13. *R. californica*.

1. *Ruellia cupheoides* Fernald, Proc. Amer. Acad. 36: 502. 1901.

Type from limestone mountains above Iguala, Guerrero, altitude 1,200 meters.

Slender shrub, 1 to 1.5 meters high, the branchlets short-pilose; leaves elliptic-ovate, 3 to 5 cm. long, short-acuminate, entire, short-pilose or glabrate; peduncles 1 to 3-flowered, longer than the leaves; calyx 1.5 to 2 cm. long, the lobes linear-lanceolate; corolla red, 3.5 cm. long.

2. *Ruellia sororia* Standl., sp. nov.

Type collected between Chilapa and Tixtla, Guerrero (*Nelson* 2160; U. S. Nat. Herb. no. 908023).

Shrub, the branchlets cinereous-puberulent and somewhat glandular-viscid; leaves petiolate, elliptic-ovate, 3 to 4.5 cm. long, acute, obtuse or acute at base, entire, whitish-pilose above, densely so beneath; flowers in dense few-flowered cymes, short-pedicellate; calyx 1.5 cm. long, the lobes linear, densely covered with short gland-tipped hairs and with some longer white eglandular ones; corolla 3.5 cm. long, glandular-pilose outside, the tube about 17 mm. long, 2 mm. thick, the throat about 15 mm. long and 7 mm. thick, very oblique, the lobes erect, 3 mm. long; anthers 3 mm. long, exceeding the corolla lobes.

In form the corolla is like that of *R. cupheoides*.

3. *Ruellia peninsularis* (Rose) I. M. Johnston, Proc. Calif. Acad. IV. 12: 1172. 1924.

Calophanes peninsularis Rose, Contr. U. S. Nat. Herb. 1: 75. 1890.

Baja California and Sonora; type from La Paz, Baja California.

Shrub, about 1 meter high, the leaves and young parts glutinous, glabrous throughout; leaves broadly ovate to oblong-ovate, acute or acuminate, rounded at base, entire; flowers solitary, short-pedicellate; calyx 5 to 6 mm. long, the lobes linear-subulate; corolla purple, 3 to 5 cm. long, the throat about 1 cm. broad.

4. *Ruellia alboviolacea* Lindau, Bull. Herb. Boiss. II. 4: 318. 1904.

Type from La Victoria, Michoacán or Guerrero, altitude 900 meters.

Shrub, 1 meter high, the branches glabrous; leaves narrowly oblong-lanceolate, 8 to 12 cm. long, long-acuminate, acute at base, entire, glabrous; peduncles several-flowered; calyx lobes linear-subulate; corolla about 3.5 cm. long, white with violet center, the throat 1 cm. broad, obscurely puberulent outside.

5. *Ruellia albiflora* Fernald, Proc. Amer. Acad. **33**: 92. 1897.

Colima to Oaxaca; type from Acapulco, Guerrero.

Shrub, about 1 meter high, the branches glabrous; leaves oblong-lanceolate to narrowly ovate, 4 to 16 cm. long, acuminate, acute to attenuate at base, entire; flowers white, sessile or nearly so in the axils; calyx 10 to 12 mm. long, the lobes linear-subulate; corolla 3 to 3.5 cm. long, puberulent, the throat 5 to 6 mm. broad. "Tronador" (Guerrero).

6. *Ruellia albicaulis* Bert.; Spreng. Syst. Veg. **2**: 822. 1825.

Sinaloa to Oaxaca, Yucatán, and Veraacruz. Central America and northern South America; type from Cartagena, Colombia.

Plants suffrutescent, about a meter high, the branches glandular-pilose, the older ones whitish; leaves long-petiolate, lance-oblong to ovate, 13 cm. long or less, acuminate, acute or short-decurrent at base, usually denticulate or serrulate, hispidulous; flowers in loose axillary cymes, slender-pedicellate; calyx glandular-pilose, the lobes linear, 1 to 1.5 cm. long; corolla purplish, 2 to 2.5 cm. long, the throat 4 to 5 mm. thick. "Hierba del cabro," "chancho del monte" (El Salvador).

The plant exhales a very strong and offensive goatlike odor.

7. *Ruellia speciosa* (Nees) Lindau in Engl. & Prantl, Pflanzenfam. **4**^{3b}: 310. 1895.

Ophthalmacanthus speciosus Nees in DC. Prodr. **11**: 220. 1847.

Ruellia pulcherrima T. Anderson; Hemsl. Biol. Centr. Amer. Bot. **2**: 507. 1882.

Hidalgo, Mexico, Puebla, and Oaxaca; type from Baños de Atoto el Grande.

Shrub, 1 to 2 meters high, the young branches glandular-pilosulous; leaves ovate or oblong-ovate, 4 to 7.5 cm. long, acute or short-acuminate, rounded or obtuse at base, entire, short-pilose and viscid, densely so beneath; peduncles elongate, 1 to 3-flowered; calyx 2.5 to 3 cm. long, the lobes lance-linear; corolla pale yellow, about 6 cm. long.

8. *Ruellia bourgaei* Hemsl. Diag. Pl. Mex. **35**. 1879.

Jalisco to Veraacruz and Mexico; type from mountains near Guadalupe, Mexico.

Plants large and coarse, herbaceous or perhaps suffrutescent, the stems densely glandular-pubescent; leaves 8 to 21 cm. long, acuminate, rounded to truncate at base and abruptly long-decurrent, sinuate-dentate, densely pubescent or sometimes glabrate; flowers pink, cymose-paniculate; calyx 2.5 to 3 cm. long; corolla 9 to 11 cm. long, the throat about 4 cm. broad.

9. *Ruellia palmeri* Greenm. Field Mus. Bot. **2**: 343. 1912.

Ruellia montezumae Lindau, Repert. Sp. Nov. Fedde **12**: 424. 1913.

Guerrero and Oaxaca; type from Acapulco, Guerrero.

Shrub, 1 to 2.5 meters high, the branches viscid-puberulent; leaves 5 to 15 cm. long, acuminate, acute to rounded at base, entire, gland-dotted, puberulent or glabrate; peduncles few-flowered; calyx 2 to 2.5 cm. long; corolla 7 to 8.5 cm. long, creamy white, the throat about 3 cm. broad.

10. *Ruellia jaliscana* Standl., sp. nov.

Type collected between Mascota and San Sebastián, Jalisco (Nelson 4051; U. S. Nat. Herb. no. 327151).

Branches obtusely quadrangular, tomentulose, glandular-pilosulous above; leaves petiolate, broadly ovate or elliptic-ovate, 9 to 18 cm. long, abruptly short-acuminate, rounded at base and abruptly decurrent, shallowly sinuate-dentate, villous-hirsutulous with whitish hairs; flowers cymose-paniculate, the peduncles

many-flowered, the flowers short-pedicellate; calyx about 5 cm. long, the lobes narrowly linear, foliaceous, densely glandular-pilose; corolla about 7 cm. long, sparsely pilosulous outside, the tube 3 cm. long, 2 to 3 mm. thick, the throat 3 cm. long, nearly 2 cm. broad, the lobes 1 cm. long, obtuse or acutish; anthers 7 mm. long, equaling the corolla lobes.

11. *Ruellia leucantha* T. S. Brandeg. *Zoe* 5: 109. 1901.

Southern Baja California.

Shrub, about 80 cm. high, the branches densely pubescent with eglandular hairs; leaves broadly ovate or oblong-ovate, 3 to 6.5 cm. long, acute or short-acuminate, entire, densely pubescent; calyx 1.5 to 2 cm. long; corolla about 6 cm. long.

12. *Ruellia hirsuto-glandulosa* (Oerst.) Hemsl. *Biol. Centr. Amer. Bot.* 2: 505. 1882.

Dipteracanthus hirsuto-glandulosus Oerst. *Nat. For. Kjöbenhavn Vid. Medd.* 1854: 123. 1854.

Querétaro, Hidalgo, and Puebla, and perhaps elsewhere; type material from Hacienda Buena Vista, Veracruz, and Tehuacán, Puebla.

Shrub; leaves broadly ovate or oblong-ovate, 1 to 3.5 cm. long, obtuse or acute, entire, densely stellate-pubescent and glandular-puberulent; calyx 2 to 2.5 cm. long; corolla 5 to 7 cm. long.

13. *Ruellia californica* (Rose) I. M. Johnston, *Proc. Calif. Acad.* IV. 12: 1171. 1924.

Calophanes californica Rose, *Contr. U. S. Nat. Herb.* 1: 85. 1890.

Baja California and Sonora; type from Santa Rosalía, Baja California.

Shrub, 1 meter high or less, densely glandular-puberulent or glandular-hirtellous; leaves broadly ovate or oblong-ovate, 1 to 3 cm. long, acute or acuminate, entire; calyx 1 to 1.5 cm. long; corolla 4.5 to 5.5 cm. long.

4. **BRAVAISIA** DC. *Bibl. Univ. Genève* 17: 124. 1838.

Shrubs or trees; leaves petiolate, entire or sinuate-dentate; flowers in paniculate cymes or thyrses; calyx 5-cleft, the lobes subcoriaceous, rounded at apex; corolla tube short, the throat ampliate, campanulate, the lobes subequal, rounded, spreading; stamens 4; ovules 2 to 4 in each cell of the ovary.

Bractlets shorter than the calyx; bracts mostly small and inconspicuous.

1. **B. integerrima.**

Bractlets longer than the calyx; bracts large and leaflike.....2. **B. tubiflora.**

1. **Bravaisia integerrima** (Spreng.) Standl.

Amazonia integerrima Spreng. *Syst. Veg.* 3: 765. 1826.

Bravaisia floribunda DC. *Prodr.* 9: 240. 1845.

Onychacanthus berlandierianus Nees in DC. *Prodr.* 11: 217. 1847.

Tamaulipas to Guerrero and Oaxaca. Central and South America.

Shrub or tree, 3.5 to 15 meters high, the young branches finely puberulent; leaves elliptic-oblong to elliptic, mostly 8 to 19 cm. long, acute or acuminate, acute or sometimes obtuse at base, glabrous or nearly so; corolla white, about 2 cm. long. "Palo blanco" (Guerrero); "palo de agua" (Costa Rica).

The genus *Androcentrum* Lem.¹ was based upon a single species, *A. multiflorum*, described from Mexico. The specimens referred to that species, which have been seen by the writer, do not appear to differ from *Bravaisia integerrima*.

¹ *Fl. Serr. Jard.* 3: 242. 1847.

2. *Bravaisia tubiflora* Hemsl. in Hook. Icon. Pl. 16: *pl. 1516*. 1886.

Yucatán; type from Cozumel Island.

Shrub or tree, sometimes 7.5 meters high, the branchlets hirtellous; leaves elliptic or oblong-elliptic, 4 to 7 cm. long, acute at base, glabrate; corolla purplish, 2 to 2.5 cm. long, the lobes usually emarginate.

5. *APHELANDRA* R. Br. Prodr. Fl. Nov. Holl. 475. 1810.

Shrubs or large herbs; leaves large; flowers red or yellow, sessile in the axes of large imbricate opposite bracts, forming large terminal spikes; calyx 5-parted, the segments narrow, subequal or the posterior one larger; corolla tube straight or incurved, sometimes ampliate above, the limb bilabiate, the posterior lip erect, the anterior reflexed-spreading, 3-lobate; stamens 4; ovules 2 in each cell.

Leaves quaternate.....1. *A. verticillata*.

Leaves opposite.

Bracts entire.

Bracts acuminate.

Lateral lobes of the lower lip of the corolla nearly as long as the central one.....2. *A. madreensis*.

Lateral lobes much shorter than the central one....3. *A. pulcherrima*.

Bracts very obtuse.

Corolla pilose outside; bracts about 2 cm. long.....4. *A. schiedeana*.

Corolla glabrous; bracts 3 to 4 cm. long.....5. *A. speciosa*.

Bracts serrate.

Lateral lobes of the lower lip one-third as long as the central one or longer.

6. *A. aurantiaca*.

Lateral lobes of the lower lip less than one-fourth as long as the central one.

7. *A. deppeana*.

1. *Aphelandra verticillata* Nees (in DC. Prodr. 11: 281, as synonym. 1849); Hemsl. Biol. Centr. Amer. Bot. 2: 513. 1882.

Crossandra haenkeana Nees in DC. Prodr. 11: 281. 1847.

Type from somewhere in Mexico.

Plants herbaceous, 60 to 90 cm. high, villous; leaves ovate, 9 cm. long or less, acuminate, attenuate at base, pilose above, pubescent beneath; bracts elliptic, cuspidate, glabrous but ciliate; corolla glabrous, 3.5 cm. long.

Known to the writer only from the original description.

2. *Aphelandra madreensis* Lindau, Bull. Herb. Boiss. II. 4: 326. 1904.

Type from the Sierra Madre of Michoacán or Guerrero, altitude 1,600 meters.

Shrub 3 to 4 meters high, the branches glabrous; leaves oblong or ovate, 10 to 15 cm. long, obtusely acuminate, glabrous above, pubescent beneath along the nerves; bracts about 17 mm. long; corolla red, puberulent, the tube 28 mm. long, the posterior lip 7 mm. long.

3. *Aphelandra pulcherrima* (Jacq.) H. B. K. Nov. Gen. & Sp. 2: 236. 1817.

Justicia pulcherrima Jacq. Enum. Pl. Carib. 11. 1760.

Reported from Guerrero. Martinique and northern South America.

Shrub, the branches villous above; leaves elliptic or ovate, decurrent at base into a short petiole, villous beneath; bracts half as long as the calyx, ovate, pubescent and ciliate; corolla red, villous.

Probably not distinct from *A. tetragona* (Vahl) Nees, which occurs in Panama and Costa Rica.

4. *Aphelandra schiedeana* Schlecht. & Cham. Linnaea 5: 95. 1830.

Veracruz and Oaxaca; type from Hacienda de la Laguna and Barranca de Tioselo, Veracruz.

Shrub; leaves oblong-lanceolate, 8 to 15 cm. long, long-acuminate, long-attenuate to the slender petiole, entire, glabrous above, sparsely appressed-pilose beneath or nearly glabrous; spikes 9 cm. long or less; bracts oval, thin, glabrous or nearly so, longer than the calyx; corolla red, about 6 cm. long, pilose,

5. *Aphelandra speciosa* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 196. 1915.
Type from Finca Mexiquito, Chiapas.

Plants suffrutescent, glabrous throughout; leaves elliptic-oblong, long-petiolate, 10 to 32 cm. long, long-acuminate, attenuate at base, thin, entire; spikes 12 to 16 cm. long, the bracts reddish, ciliolate, longer than the calyx; corolla red, glabrous, the tube 2 cm. long.

6. *Aphelandra aurantiaca* (Scheidw.) Lindl. Bot. Reg. 31: pl. 12. 1845.

Hemisandra aurantiaca Scheidw. Bull. Acad. Brux. 9¹: 22. 1842.

Aphelandra acutifolia Nees in DC. Prodr. 11: 299. 1847.

?*Hydromestus maculatus* Scheidw. in Otto & Dietr. Allgem. Gartenz. 1842: 285. 1842.

?*Strobilorchis glabra* Klotzsch; Link, Klotzsch & Otto, Icon. Pl. Rar. 117. pl. 48. 1842.

?*Aphelandra hydromestus* Hemsl. Biol. Centr. Amer. Bot. 2: 512. 1882.

Oaxaca, Chiapas, and Tabasco. Central and South America.

Plants herbaceous or suffrutescent; leaves lance-oblong to elliptic, 8 to 30 cm. long, acuminate, acute or attenuate at base, entire, glabrous or nearly so; spikes 6 to 16 cm. long, the bracts pilose or puberulent; corolla orange, about 6 cm. long.

7. *Aphelandra deppeana* Schlecht. & Cham. Linnaea 5: 96. 1830.

Aphelandra cristata H. B. K. Nov. Gen. & Sp. 2: 236. 1817. Not *A. cristata* R. Br. 1810.

Aphelandra pectinata Willd.; Nees in DC. Prodr. 11: 297. 1847.

Aphelandra haenkeana Nees in DC. Prodr. 11: 298. 1847.

Guerrero to Chiapas, Tabasco, Yucatán, and Veracruz; type from Hacienda de la Laguna, Veracruz. Central and South America; West Indies.

Shrub, 1 to 4.5 meters high; leaves ovate-elliptic to lance-oblong, 7 to 20 cm. long, acuminate, decurrent below, often to the base of the petiole, entire, usually scabrous above and pubescent beneath; spikes often clustered, the bracts with glandular spots on each side; corolla red, about 4 cm. long. "Añilillo," "añil cimarrón" (Tabasco); "chamoltaco" (Nicaragua); "oreja de coyote," "cordoncillo," "palo del golpe" (El Salvador).

6. **BERGINIA** Harv.; Benth. & Hook. Gen. Pl. 2: 1096. 1873.

Low shrubs with whitish branches; leaves sessile or nearly so, entire; flowers small, sessile in the axils of small bracts, forming terminal, more or less interrupted spikes; bractlets narrow, rigid, resembling the calyx lobes; calyx 5-parted, the segments linear-lanceolate, acute, rigid; corolla tube short, ampliate above, the limb bilabiate; stamens 4, the anthers glabrous; ovules 2 in each cell.

The following species are the only ones known.

Leaves oblong-lanceolate to linear-lanceolate, minutely scaberulo-puberulent.

1. **B. virgata**.

Leaves broadly ovate to oval or rounded, hirtellous-----2. **B. palmeri**.

1. **Berginia virgata** Harv.; Benth. & Hook. Gen. Pl. 2: 1097. 1873.

Pringleophytum lanceolatum A. Gray, Proc. Amer. Acad. 20: 293. 1885.

Baja California and Sonora; type probably from Sonora.

Branches scaberulous; leaves 1 to 4 cm. long, obtuse or acute; spikes 13 cm. long or less; calyx 5 to 6 mm. long, minutely puberulent; corolla about 12 mm. long, puberulent, pink.

2. *Berginia palmeri* Rose, Contr. U. S. Nat. Herb. 1: 86. 1890.

Type from Santa Rosalia, Baja California.

Shrub, 50 cm. high; leaves 7 to 15 mm. long, obtuse or rounded at apex; spikes 6 mm. long or less; calyx densely glandular-pubescent; corolla pink, 1 cm. long.

7. **LOUTERIDIUM** S. Wats. Proc. Amer. Acad. 23: 283. 1888.

Shrubs; leaves petiolate, crenate or entire; flowers large, in narrow, nearly naked, terminal racemes or panicles; calyx cleft nearly to the base, the lobes broad, the 3 upper ones wholly united, the 2 upper ones distinct; corolla tube very short, abruptly expanded into a broad hoodlike throat, the lobes short; stamens 2, exerted; capsule sessile, the cells 6 to 8-seeded.

Two other species are known, natives of Guatemala and Costa Rica.

Leaves oblanceolate-oblong, long-attenuate to the base-----1. *L. mexicanum*.

Leaves rounded-ovate, cordate or subcordate at base-----2. *L. conzattii*.

1. *Louteridium mexicanum* (Baill.) Standl.

Neolindenia mexicana Baill. Bull. Soc. Linn. Paris 2: 851. 1889.

Louteridium purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 68. 1914.

Chiapas; type from Zacuapán.

Plants suffrutescent, glabrous except in the inflorescence, there minutely puberulent; leaves 15 to 28 cm. long, short-acuminate, short-petiolate, nearly entire; flowers yellowish and purplish, long-pedicellate; calyx 2 to 3.5 cm. long.

2. *Louteridium conzattii* Standl., sp. nov.

Type collected along the banks of the Río Grande, between Jalapa de Díaz and La Raya, Distrito de Tuxtépec, Oaxaca, altitude 450 meters (*Conzatti* 3788; U. S. Nat. Herb. no. 1,014,038).

Plants glabrous throughout; petioles 4.5 to 6 cm. long; leaves rounded-ovate, 11 to 22 cm. long, 10 to 17 cm. wide, cuspidate-acuminate, shallowly or deeply cordate at base, entire or nearly so; flowers in a terminal elongate leafy-bracted panicle; calyx about 2 cm. long, the upper lobe abruptly short-acuminate, the lower ones falcate, obtuse.

All the flowers are still in bud and the corollas not yet fully developed. The plant is closely related to *L. donnell-smithii* S. Wats., but in that all parts are densely pubescent.

8. **CHILERANTHEMUM** Oerst. Dansk. Vid. Medd. 1854: 166. 1854.

A single species is known.

1. *Chileranthemum trifidum* Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1854: 166. 1854.

Veracruz; type from Mecapalco.

Glabrous shrub; leaves lance-oblong, about 6 cm. long, obtusely acuminate, acute at base, petiolate, entire; peduncles axillary, trichotomous, few-flowered; calyx 5-parted, the segments equal, linear, 6 mm. long; corolla tube 5 mm. long, the limb bilabiate, 8 mm. long; fertile stamens 2, the anther cells equal and inserted at the same height, 2 small staminodia also present; ovules 2 in each cell.

Known to the writer only from the original description and from Hemsley's illustration.¹

9. **ODONTONEMA** Nees, Linnæa 16: 300. 1842.

Plants herbaceous or suffrutescent, large; leaves large, entire; flowers red, pedicellate, fasciculate in the axils of small bracts, arranged in terminal, simple or paniculate racemes; calyx small, 5-parted, the segments narrow, acuminate;

¹ Biol. Centr. Amer. Bot. pl. 67, f. 1-5.

corolla tube elongate, straight or slightly curved, slightly ampliate above, the limb nearly regular or bilabiate, the posterior lip entire or bilobate, the anterior one 3-parted; stamens 2; ovules 2 in each cell.

Corolla limb conspicuously bilabiate, the lobes 5 to 8 mm. long.

1. *O. callistachyum*.

Corolla limb nearly regular, the lobes usually shorter.

Leaves pubescent on both surfaces; inflorescence leafy-bracted.

2. *O. foliaceo-bracteatum*.

Leaves glabrous or nearly so; inflorescence not leafy-bracted.

Inflorescence racemose, puberulent; leaves puberulent beneath along the costa-----

3. *O. cuspidatum*.

Inflorescence thyrsoid-paniculate, glabrous; leaves glabrous.

4. *O. glabrum*.

1. *Odontonema callistachyum* (Schlecht. & Cham.) Kuntze, Rev. Gen. Pl. 2: 494. 1891.

Justicia callistachya Schlecht. & Cham. Linnaea 6: 370. 1831.

Thysacanthus callistachyus Nees in DC. Prodr. 11: 326. 1847.

Thysacanthus lilacinus Lindl. Journ. Hort. Soc. Lond. 6: 159. 1851.

Veracruz, Puebla, Oaxaca, and Chiapas; type from Misantla, Veracruz. Central America.

Plants suffrutescent, 2 to 4.5 meters high; leaves lance-oblong to elliptic-ovate, 10 to 30 cm. long, acuminate, glabrous or nearly so, the upper ones usually sessile but the lower petiolate; flowers red or pink, in dense or interrupted, racemiform, often paniculate thyrses, the branches pubescent or glabrous; corolla 2.5 to 3 cm. long, the throat 5 mm. broad.

2. *Odontonema foliaceo-bracteatum* (Oerst.) Kuntze, Rev. Gen. Pl. 2: 494. 1891.

Thysacanthus foliaceo-bracteatus Oerst. Nat. For. Kjöbenhavn. Vid. Medd. 1854: 146. 1855.

Type from Mirador, Veracruz.

Stems villous; leaves oblong or ovate-oblong, about 13 cm. long, short-acuminate, attenuate at base to a short petiole; flowers sessile; calyx lobes linear.

Known to the writer only from the original description. The plant was referred doubtfully to *Thysacanthus* by Oersted and may belong to some other genus.

3. *Odontonema cuspidatum* (Nees) Kuntze, Rev. Gen. Pl. 2: 494. 1891.

Thysacanthus cuspidatus Nees in DC. Prodr. 11: 323. 1847.

Chiapas and Tabasco; reported from Oaxaca; type from Teapa, Tabasco.

Leaves oval to elliptic-oblong, about 25 cm. long, acuminate, acute at base, petiolate, glabrous above; corolla 2.5 cm. long.

Thysacanthus strictus Nees,¹ of Guatemala and El Salvador, is scarcely distinct.

4. *Odontonema glabrum* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 195. 1915. Chiapas; type from Finca Irlanda.

Plants suffrutescent, glabrous throughout; leaves short-petiolate, lance-oblong to oblong-elliptic, 10 to 20 cm. long, long-acuminate, acute at base; corolla 2.5 cm. long.

10. **CARLOWRIGHTIA** A. Gray, Proc. Amer. Acad. 13: 364. 1877.

Plants suffrutescent or herbaceous; leaves entire; flowers small, loosely spicate or racemose, often paniculate; calyx 5-parted or 5-cleft; corolla tube slender, the throat not dilated, the limb nearly equally 4-cleft; stamens 2, the anther cells equal, inserted at the same height; capsule stipitate, 4-seeded.

¹ In DC. Prodr. 11: 324. 1847.

Leaves linear or nearly so.

- Branches of the inflorescence glabrous.....1. *C. pectinata*.
 Branches of the inflorescence puberulent.
 Pubescence glandular.....2. *C. lindauiana*.
 Pubescence eglandular.....3. *C. linearifolia*.

Leaves lanceolate to broadly ovate.

Flowers axillary or in short racemes.

Stems very minutely puberulent, the hairs scarcely perceptible.

4. *C. parvifolia*.

Stems pilose or pubescent, the hairs conspicuous.

Pubescence all or chiefly eglandular.....5. *C. pubens*.

Pubescence chiefly of gland-tipped hairs.

Leaves cordate or subcordate at base.....6. *C. glandulosa*.

Leaves obtuse or acute at base.....7. *C. serpyllifolia*.

Flowers chiefly in long naked spikes.

Branches bisulcate and angulate.

Stems scaberulous; capsule glabrous.....8. *C. ovata*.

Stems sparsely hirsute; capsule puberulent.....9. *C. haplocarpa*.

Branches terete.

Leaves nearly sessile, 6 mm. wide or less.....10. *C. arizonica*.

Leaves conspicuously petiolate, 1 to 4 cm. wide or larger.

Leaves rounded or obtuse at base.....11. *C. glabrata*.

Leaves cordate or subcordate at base.

Stems very minutely puberulent.....12. *C. cordifolia*.

Stems short-pilose or pubescent.....13. *C. californica*.

1. *Carlowrightia pectinata* T. S. Brandeg. Proc. Calif. Acad. II. 3: 160. 1891.

Baja California, Sonora, and Sinaloa; type from San José del Cabo, Baja California.

Plants slender, herbaceous or suffrutescent, erect or decurrent, glabrous; leaves sessile, 2 to 10 cm. long, 2 to 7 mm. wide; flowers in interrupted panicle few-flowered spikes; corolla 6 to 7 mm. long, the tube much shorter than the lobes.

Carlowrightia fimbriata T. S. Brandeg.,¹ described from San Pedro, Baja California, is scarcely distinct.

2. *Carlowrightia lindauiana* Standl.

Carlowrightia linearifolia Lindau, Bull. Herb. Boiss. 5: 661. 1897. Not

C. linearifolia A. Gray, 1877.

Querétaro and Hidalgo; type from some unknown Mexican locality.

Plants slender, woody below, the stems striate, glabrate; leaves 2 to 5 cm. long, 5 mm. wide or less, sessile or nearly so, glabrous or scaberulous; flowers in slender interrupted naked spikes; corolla purplish, 8 to 10 mm. long, the tube 2 mm. long; capsule puberulent or glabrous.

3. *Carlowrightia linearifolia* (Torr.) A. Gray, Proc. Amer. Acad. 13: 364. 1877.

Schauëria linearifolia Torr. U. S. & Mex. Bound. Bot. 123. 1859.

No Mexican specimens seen by the writer, but the plant doubtless occurs in Chihuahua. Western Texas to southern Arizona.

Plants herbaceous or often fruticose below, the branches minutely scaberulous; leaves narrowly linear, 1 to 3.5 cm. long, scaberulous; flowers pedicellate, racemose-paniculate; corolla purplish, 1 cm. long.

4. *Carlowrightia parvifolia* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 190. 1911.

¹ Proc. Calif. Acad. II. 3: 161. 1891.

Coahuila and Nuevo León; type from Sierra de la Paila, Coahuila.

Plants chiefly herbaceous, 20 cm. high or less, much branched; leaves linear-lanceolate to lance-ovate, less than 1 cm. long, acute at base; corolla 7 mm. long.

5. **Carlowrightia pubens** A. Gray, Proc. Amer. Acad. **21**: 406. 1886.

Shauceria parvifolia Torr. U. S. & Mex. Bound. Bot. 122. 1859. Not *Carlowrightia parvifolia* T. S. Brandeg. 1911.

Dianthera parvifolia A. Gray, Syn. Fl. **2**: 330. 1878.

Chihuahua to Nuevo León. Western Texas; type collected along Cibolo Creek.

Plants chiefly herbaceous, 25 cm. high or less, much branched; leaves petiolate, ovate or broadly ovate, 1.5 cm. long or less, obtuse or acute, densely pubescent; corolla about 7 mm. long; stipe shorter than the body of the capsule.

6. **Carlowrightia glandulosa** Robins. & Greenm. Proc. Amer. Acad. **32**: 40. 1896.

San Luis Potosí to Puebla and Oaxaca; type from Monte Alban, Oaxaca, altitude 1,650 meters.

Plants chiefly herbaceous, densely glandular-pubescent or pilose throughout; leaves petiolate, ovate or broadly ovate, 1 to 6 cm. long, acute or obtuse; corolla purplish, about 1.5 cm. long; stipe fully as long as the body of the capsule.

7. **Carlowrightia serpyllifolia** A. Gray, Proc. Amer. Acad. **21**: 405. 1886.

Coahuila; type from mountains near Jimulco.

Plants suffrutescent, loosely branched, with whitish branches; leaves petiolate, lance-oblong to ovate, 6 to 15 mm. long, acute or obtuse, glandular-puberulent; corolla purplish; stipe equaling the body of the capsule.

8. **Carlowrightia ovata** A. Gray, Proc. Amer. Acad. **21**: 406. 1886.

Type collected near the city of Chihuahua.

Plants woody below, procumbent; leaves short-petiolate, ovate or broadly ovate, 1 to 1.5 cm. long, acuminate, rounded at base, glabrate; corolla purple; stipe equaling the body of the capsule.

9. **Carlowrightia haplocarpa** Robins. & Greenm. Proc. Amer. Acad. **29**: 30. 1894.

San Luis Potosí; type from Villar.

Plants slender, suffrutescent, 40 cm. high or less; leaves subsessile, broadly ovate, 2 to 4 cm. long, subcordate at base, sparsely hirsute or glabrate beneath; corolla purple, 10 to 12 mm. long; capsule pubescent, the stipe equaling the body.

10. **Carlowrightia arizonica** A. Gray, Proc. Amer. Acad. **13**: 364. 1877.

Sonora and Sinaloa. Southern Arizona; type from Camp Grant.

Plants woody below, 50 cm. high or less, the branches minutely puberulent; leaves oblong to linear-lanceolate, 1.5 to 3 cm. long, acuminate, short-petiolate; corolla about 13 mm. long, cream-colored; stipe usually longer than the body of the capsule.

11. **Carlowrightia glabrata** Fernald, Bot. Gaz. **20**: 536. 1895.

Sinaloa to Guerrero; type from Manzanillo, Colima.

Plants large, slender, hirtellous or glabrous; leaves short-petiolate, lance-oblong to oblong-ovate, 4 to 7.5 cm. long, acute, pubescent or glabrate beneath; stipe longer than the body of the capsule.

12. **Carlowrightia cordifolia** A. Gray, Proc. Amer. Acad. **21**: 406. 1886.

Chihuahua and Baja California; type from mountains above Batopilas, Chihuahua.

Plants chiefly herbaceous; leaves petiolate, ovate, 1 to 4 cm. long, acute or acuminate, finely puberulent; corolla white, 1 cm. long; stipe equaling the body of the capsule.

13. *Carlowrightia californica* T. S. Brandeg. Zoc 5: 172. 1903.

Baja California and Sinaloa; type from southern Baja California.

Plants chiefly herbaceous; leaves petiolate, ovate or broadly ovate, 3 to 6 cm. long, pubescent, acuminate; corolla cream-colored, 8 mm. long; stipe equaling the body of the capsule.

Probably only a form of *C. cordifolia*.

11. ANISACANTHUS Nees, *Linnaea* 16: 307. 1842.

Shrubs; leaves petiolate, entire; flowers red, mostly in terminal, simple or branched, secund, interrupted, terminal spikes, the bracts usually small; calyx 5-cleft, the segments narrow, subequal; corolla tube slender, elongate, straight or slightly incurved, the limb bilabiate, the posterior lip usually entire, the anterior 3-parted; stamens 2, the anther cells equal and inserted at the same height; ovules 2 in each cell.

Bractlets much longer than the calyx..... 1. *A. abditus*.

Bractlets much shorter than the calyx.

Calyx lobes longer than the stipe of the capsule and often equaling the body of the capsule..... 2. *A. thurberi*.

Calyx lobes equaling or shorter than the stipe of the capsule.

Calyx without glandular pubescence.

Calyx lobes glabrous but ciliate; lips of the corolla shorter than the tube.

3. *A. gonzalezii*.

Calyx lobes pubescent on the back; lips about as long as the tube.

4. *A. pumilus*.

Calyx glandular-puberulent.

Corolla 4 to 5.5 cm. long..... 5. *A. insignis*.

Corolla 3 to 3.5 cm. long.

Calyx in anthesis about 3 mm. long..... 6. *A. wrightii*.

Calyx in anthesis 5 to 6 mm. long..... 7. *A. quadrifidus*.

1. *Anisacanthus abditus* T. S. Brandeg. Zoc. 3: 348. 1893.

Sonora; type from Sierra Matapán.

Shrub, 1 meter high or less, with whitish branches; leaves long-petiolate, lanceolate or ovate-lanceolate, 2 to 3 cm. long, acuminate, densely glandular-puberulent; inflorescence short and dense, leafy-bracted, few-flowered; bractlets 8 to 12 mm. long, obtuse glandular-pilosulous; corolla rose-colored, 3 to 4 cm. long, glabrous.

2. *Anisacanthus thurberi* (Torr.) A. Gray, Syn. Fl. 2: 328. 1878.

Drejera thurberi Torr. U. S. & Mex. Bound. Bot. 124. 1859.

Chihuahua and Sonora; type from Las Animas, Sonora. Arizona and New Mexico.

Shrub, 1.5 meters high or less; leaves lanceolate or oblong, short-petiolate, 1.5 to 5 cm. long, hirtellous or puberulent; flowers pedicellate, the calyx glandular-puberulent; corolla red, 2.5 to 3.5 cm. long, pilose, the lobes equaling or shorter than the tube. "Chuparosa" (Sonora, Arizona).

3. *Anisacanthus gonzalezii* Greenm. Proc. Amer. Acad. 39: 89. 1903.

Oaxaca; type from Cuesta de Quiotepec, altitude 1,200 meters.

Shrub, the branchlets appressed-pubescent or glabrate; leaves short-petiolate, lance-ovate to linear-lanceolate, 2 to 4.5 cm. long, acuminate, glabrous or pubescent beneath along the costa; calyx 6 to 8 mm. long; corolla red, 3 to 4 cm. long, pilosulous, the lips shorter than the tube.

4. *Anisacanthus pumilus* (Dietr.) Nees in DC. Prodr. 11: 445. 1847.

Justicia pumila Dietr. Vollst. Lex. Gärt. Nachtr. 4: 197. 1815-21.

Drejera greggii Torr. U. S. & Mex. Bound. Bot. 124. 1859.

Anisacanthus greggii A. Gray, Syn. Fl. 2¹: 328. 1878.

San Luis Potosí to Michoacán.

Low shrub with exfoliating bark; leaves lanceolate or lanceovate, short-petiolate, 4 cm. long or less, cinereous-pilose beneath or finally glabrate; calyx about 6 mm. long; corolla 4 to 4.5 cm. long, puberulent.

5. *Anisacanthus insignis* A. Gray, Syn. Fl. ed. 2. 2¹: 457. 1886.

Chihuahua, Coahuila, and Durango. Western Texas.

Shrub; leaves short-petiolate, linear to narrowly lanceolate (on young sterile shoots sometimes lance-ovate and long-petiolate), 2 to 3 cm. long, puberulent or glabrate; flowers pedicellate; calyx 6 to 7 mm. long; corolla rose-red or salmon-colored, pilosulous.

The writer has seen no material of *A. tulensis* Greenm.¹, which was described from Santa María del Tule, Oaxaca. Its description agrees well with specimens of *A. insignis*, but it may be a distinct species.

6. *Anisacanthus wrightii* (Torr.) A. Gray, Syn. Fl. 2¹: 328. 1878.

Drejera wrightii Torr. U. S. & Mex. Bound. Bot. 123. 1859.

Coahuila and Zacatecas to Tamaulipas. Western Texas; type collected between the Guadalupe River and the Rio Grande.

Shrub, about 1 meter high, the branches puberulent in lines; leaves short-petiolate, linear to ovate-lanceolate, 2 to 4.5 cm. long, acuminate, glabrous or nearly so; flowers sessile; corolla puberulent or pilosulous. "Muicle" (Tamaulipas).

The plant is employed in Tamaulipas as a remedy for colic.

7. *Anisacanthus quadrifidus* (Vahl) Standl.

Justicia coccinea Cav. Icon. Pl. 2: pl. 199. 1793. Not *J. coccinea* Aubl. 1775.

Justicia quadrifida Vahl, Enum. Pl. 1: 124. 1804.

Justicia virgularis Salisb. Parad. Lond. pl. 50. 1806-07.

Anisacanthus virgularis Nees in DC. Prodr. 11: 445. 1847.

Drejera puberula Torr. U. S. & Mex. Bound. Bot. 123. 1859.

Drejera juncea Torr. U. S. & Mex. Bound. Bot. 124. 1859.

Anisacanthus junceus Hemsl. Biol. Centr. Amer. Bot. 2: 522. 1882.

San Luis Potosí to Puebla and Oaxaca.

Shrub, about 1 meter high; leaves short-petiolate or subsessile, linear to lanceolate, 2 to 5 cm. long, long-acuminate, glabrous or nearly so; corolla red, pilosulous or puberulent.

12. **NEOHALLIA** Hemsl. Biol. Centr. Amer. Bot. 2: 519. 1882.

A single species is known.

1. *Neohallia borraerae* Hemsl. Biol. Centr. Amer. Bot. 2: 519. 1882.

Veracruz and Chiapas; type from Chiapas.

Plants large, probably shrubby, glabrous; leaves oblong-ob lanceolate, 20 to 35 cm. long, acuminate, attenuate to the base, short-petiolate, entire; flowers in pedunculate clusters of 2 or 3, the large bracts about 6 cm. long, cuplike; calyx tubular, subequally 5-dentate; corolla about 7 cm. long, the tube slender, slightly incurved, the limb bilabiate, the posterior lip erect, narrow, subemarginate, the lower short and 3-dentate; stamens 2, the anther cells unequal.

13. **TABASCINA** Baill. Hist. Pl. 10: 445. 1891.

The single species of the genus is known to the writer only from description.

1. *Tabascina lindeni* Baill. Hist. Pl. 10: 445. 1891.

Mexico, the locality not indicated, but (judging from the generic name) probably in Tabasco.

¹ Field Mus. Bot. 2: 343. 1912.

Shrub; leaves elliptic-acuminate, long-attenuate to the petiole, large, nearly glabrous; flowers in terminal cymes, the bracts and bractlets small; calyx lobes broad, foliaceous, the posterior one larger; corolla tube campanulate, pubescent, the limb with 5 short subequal lobes; stamens 2. the cells unequal.

14. **JACOBINIA** Moric. Pl. Nouv. Amer. 156. 1846.

Shrubs or herbs; leaves entire; flowers usually red or yellow, sessile in the axils of bracts or short-pedicellate, solitary, cymose, spicate, or paniculate; calyx 5-cleft or 5-parted, the lobes narrow; corolla tube usually slender and elongate, straight or incurved, the limb bilabiate, the posterior lip narrow, erect, entire or shallowly bilobate, the anterior lip 3-lobate; stamens 2, the anther cells more or less unequal, not appendaged at base; ovules 2 in each cell.

Flowers in a large dense terminal thyrse; leaves not auriculate at base of petiole.

1. **J. umbrosa.**

Flowers not in a dense terminal thyrse or, if so, the leaves auriculate at base of petiole.

Leaves stellate-pubescent.....2. **J. stellata.**

Leaves glabrous or with pubescence of simple hairs.

Calyx lobes mostly 2 to 3 mm. wide, large and herbaceous, sometimes obtuse.

Calyx lobes obtuse.....3. **J. purpusii.**

Calyx lobes acuminate.

Calyx parted nearly to the base.....4. **J. paniculata.**

Calyx with a tube nearly as long as the lobes.....5. **J. albicaulis.**

Calyx lobes 1.5 mm. wide or less, small, linear or lance-subulate, never obtuse.

Leaves auriculate at base of petiole.....6. **J. auriculata.**

Leaves not auriculate at base.

Corolla glabrous.

Leaves densely velutinous-pubescent beneath.....7. **J. incana.**

Leaves glabrous beneath except along the veins.....8. **J. spicigera.**

Corolla pilose or puberulent.

Calyx glandular-pubescent.

Stems pubescent-tomentose.....9. **J. aschenborniana.**

Stems hirsute.....10. **J. heterophylla.**

Calyx without glandular pubescence.

Bracts equaling or longer than the calyx.....11. **J. candicans.**

Bracts much shorter than the calyx.

Leaves glabrate beneath.....12. **J. mexicana.**

Leaves subtomentose beneath.....13. **J. mollis.**

1. **Jacobinia umbrosa** (Benth.) Blake, Contr. Gray Herb. n. ser. 52: 103. 1917.

Justicia aurea Schlecht. *Linnaea* 7: 393. 1832.

Justicia umbrosa Benth. Pl. Hartw. 79. 1841.

Cyrtanthera catalpaefolia Nees in Curtis's Bot. Mag. pl. 4444. 1849.

?*Cyrtanthera chrysostephana* Hook. f. in Curtis's Bot. Mag. pl. 5887. 1871.

Jacobinia aurea Hemsl. Diag. Pl. Mex. 35. 1879. Not *J. aurea* Hiern, 1877-78.

Veraacruz, Oaxaca, and Chiapas; type from Tioselo, Veraacruz. Central America.

Shrub or small tree, 1 to 4 meters high or larger, the branches puberulent or glabrous; leaves petiolate, lance-oblong to broadly ovate, 10 to 45 cm. long, usually acute or acuminate, abruptly decurrent at base, puberulent or nearly glabrous beneath; thyrses 7 to 30 cm. long, many-flowered; corolla yellow, about 5 cm. long, puberulent or pilosulous. "Monte de oro," "pluma de oro" (Veraacruz, Oaxaca); "cola de ardilla" (El Salvador).

- 2. *Jacobinia stellata*** Robins. & Greenm. Proc. Amer. Acad. **29**: 390. 1894.
Type from barranca of Tequila, Jalisco.
Plants finely stellate-pubescent throughout; leaves short-petiolate, lanceolate or ovate-lanceolate, 5 to 13.5 cm. long, acuminate; flowers in few-flowered cymes in the upper axils; calyx glandular-pubescent, the lobes linear-oblong, acute; corolla reddish purple, 4 cm. long.
- 3. *Jacobinia purpusii*** T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 195. 1915.
Chiapas; type from Finca Irlanda.
Plants chiefly herbaceous, the stems villosulous; leaves slender-petiolate, ovate-oblong to broadly ovate, 5 to 9 cm. long, acuminate, acute to rounded at base, villosulous or sometimes hirsute beneath; flowers in small sessile terminal clusters; corolla yellow (?), about 7 cm. long, glandular-villosulous.
- 4. *Jacobinia paniculata*** Oerst. Nat. For. Kjöbenhavn Vid. Medd. **1854**: 153. 1855.
Veracruz; cultivated at Guanajuato; type material from Mirador and Colipa, Veracruz. Central America.
Plants suffrutescent, glabrous or nearly so; leaves petiolate, lance-oblong or elliptic-oblong, acuminate, acute at base; flowers in lax terminal panicles; calyx 16 mm. long or less; corolla red and yellow, 3 to 3.5 cm. long, pubescent.
- 5. *Jacobinia albicaulis*** T. S. Brandeg. Univ. Calif. Publ. Bot. **4**: 386. 1913.
Type from Baños del Carrizal, Veracruz.
Shrub, the branches glabrous; leaves nearly sessile, oblong-obovate, 6 to 12.5 cm. long, short-acuminate, cuneate-attenuate at base, scaberulous above, sparsely puberulent or glabrate beneath; flowers cymose-paniculate; calyx 7 mm. long, glabrate; corolla red, 18 mm. long, glabrous.
- 6. *Jacobinia auriculata*** Rose, Contr. U. S. Nat. Herb. **1**: 349. 1895.
Type from Colima.
Shrub, 1 meter high, the branchlets quadrangular; leaves sessile and clasping, lance-oblong or ovate-oblong, 8 to 15 cm. long, acuminate, rather abruptly attenuate, glabrate; flowers in a dense terminal panicle; corolla crimson, 2.5 cm. long.
- 7. *Jacobinia incana*** (Nees) Hemsl. Biol. Centr. Amer. Bot. **2**: 521. 1882.
Sericographis incana Nees in DC. Prodr. **11**: 361. 1847.
Nuevo León, Tamaulipas, and San Luis Potosí; reported from Veracruz; type from Toluca (Querétaro ?).
Shrub, about 1 meter high, the branches densely pubescent; leaves petiolate, oblong to ovate, 6 to 14 cm. long, usually obtuse, acute or decurrent at base; flowers in few-flowered axillary and terminal cymes; corolla red, 4 cm. long. "Muicle" (Nuevo León, Tamaulipas).
Used in Tamaulipas as a remedy for colic.
- 8. *Jacobinia spicigera*** (Schlecht.) L. H. Bailey, Stand. Cycl. Hort. 1715. 1915.
Justicia spicigera Schlecht. Linnaea **7**: 395. 1832.
Justicia atramentaria Benth. Pl. Hartw. 69. 1840.
Drejera willdenowiana Nees in DC. Prodr. **11**: 334. 1847.
Sericographis mohintli Nees in DC. Prodr. **11**: 361. 1847.
Jacobinia mohintli Hemsl. Biol. Centr. Amer. Bot. **2**: 521. 1882.
Tepec to San Luis Potosí, Veracruz, and Chiapas; often cultivated; type from Jalapa, Veracruz. Central America.
Shrub, 1 to 1.5 meters high, the branches puberulent or glabrate; leaves short-petiolate, lance-oblong to ovate, 6 to 17 cm. long, usually acute, glabrate; flowers in few-flowered, axillary or terminal cymes; corolla red or orange, 3 to 3.5 cm. long. "Micle" (Guerrero, Durango); "mohuitli," "muicle," "moictle," "muicli," "moytli," "mohitli," "mohintli," "mohintle" (Oaxaca, Guanajuato, Querétaro, Mexico, etc.; derivatives of the Nahuatl *mohuitli*, "blue"); "hierba del

añil" (Chiapas); "hierba azul" (Veracruz); "trompetilla" (Veracruz); "charait-zicua" (Tarascan, *Ramírez*); "hierba añil" (*Ramírez*); "mozote" (*Nueva Farm. Mex.*); "mirto del cerro" (Querétaro); "tinta," "sacatina," "hierba de la Santísima Trinidad" (El Salvador).

This plant is well known in Mexico and nearly throughout Central America. The leaves are placed in hot water, which at first assumes a dingy blackish color but later becomes dark blue. This solution is employed by laundresses for whitening clothes, in the same manner as indigo. The plant was employed formerly in Mexico also as a dye. It is used as a remedy for dysentery, fevers, gonorrhoea, and other affections.

9. *Jacobinia aschenborniana* (Nees) Hemsl. Biol. Centr. Amer. Bot. 2: 520. 1882.

Sericographis aschenborniana Nees in DC. Prodr. 11: 362. 1847.

?*Sericographis haplostachya* Nees in DC. Prodr. 11: 362. 1847.

Described from somewhere in Mexico.

Leaves long-petiolate, broadly ovate, obtusely cuspidate, hirsute above, hirsute-tomentose beneath; corolla 2.5 cm. long.

Known to the writer only from the original description.

10. *Jacobinia heterophylla* (Schlecht. & Cham.) Hemsl. Biol. Centr. Amer. Bot. 2: 520. 1882.

Justicia heterophylla Schlecht. & Cham. Linnaea 5: 95. 1830.

Type from Cerro Colorado, Veracruz.

Stems fruticose; leaves petiolate, ovate, obtusely acuminate, acute at base, hirsute along the costa; corolla 2.5 cm. long.

Known to the writer only from description.

11. *Jacobinia candicans* (Nees) Benth. & Hook.: Hook. & Jacks. Ind. Kew 1: 1246. 1893.

Adhatoda candicans Nees in DC. Prodr. 11: 396. 1847.

Dianthera candicans Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 517. 1882.

Jacobinia ovata A. Gray, Proc. Amer. Acad. 21: 405. 1886.

Jacobinia ovata subglabra S. Wats. Proc. Amer. Acad. 24: 67. 1889.

Sonora to Oaxaca and Puebla; type from mountains of Oaxaca.

Shrub, 1 to 1.5 meters high; leaves petiolate, ovate or broadly ovate, 3 to 7 cm. long, acute or acuminate, pubescent or glabrate; flowers in small, dense, few-flowered, sessile or subsessile clusters; corolla red, 3.5 to 4 cm. long. "Espuela de caballero" (Sinaloa).

12. *Jacobinia mexicana* Seem. Bot. Voy. Herald 325. pl. 66. 1857.

?*Jacobinia uhdei* Lindau, Bull. Herb. Boiss. 3: 488. 1895.

Sinaloa; Querétaro (?); type from the Sierra Madre.

Shrub, the branchlets puberulent or glabrate; leaves petiolate, ovate or lanceolate, 3 to 12 cm. long, acuminate, abruptly decurrent at base; corolla red, about 3.5 cm. long.

13. *Jacobinia mollis* Greenm. Proc. Amer. Acad. 39: 91. 1903.

Type from Oaxaca.

Branchlets hirsute-pubescent; leaves petiolate, ovate or ovate-lanceolate, 2 to 9 cm. long, short-acuminate; flowers in short axillary racemes; corolla purplish, 3.5 cm. long.

DOUBTFUL SPECIES.

JACOBINIA GHIESBREGHTIANA (Lem.) Hemsl. Biol. Centr. Amer. Bot. 2: 520. 1882. *Cyrtanthera ghiesbreghtiana* Lem. Fl. Serr. Jard. 1847: Misc. No. 7. 1847; *Sericographis ghiesbreghtiana* Nees in DC. Prodr. 11: 730. 1847. Described from cultivated plants of Mexican origin.

JACOBINIA LONGIFLORA (Nees) Hemsl. Biol. Centr. Amer. Bot. **2**: 521. 1882. *Heinzelia longiflora* Nees in DC. Prodr. **11**: 314. 1847. Type from "Las Ajuntas."

JACOBINIA MACROPHYLLA (Oerst.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. **2**: 521. 1882. *Sericographis macrophylla* Oerst. Nat. For. Kjöbenhavn Vid. Medd. **1854**: 149. 1855. Type from Veracruz.

JACOBINIA OAXACANA Greenm. Proc. Amer. Acad. **39**: 91. 1903. Type from Oaxaca.

JACOBINIA VIRGATA (Oerst.) Hemsl. Biol. Centr. Amer. Bot. **2**: 522. 1882. *Sericographis virgata* Oerst. Nat. For. Kjöbenhavn Vid. Medd. **1854**: 154. 1855. Type from Acatlán and Ejutla. Oaxaca.

15. *JUSTICIA* L. Sp. Pl. 15. 1753.

Shrubs or herbs; leaves entire; flowers small or large, white, purplish, or red, variously arranged; calyx 4 or 5-parted, the segments narrow; corolla tube usually shorter than the limb, ampliate above, the limb bilabiate; stamens 2, the anther cells unequal, the lower one appendaged at base; ovules 2 in each cell.

Several herbaceous species occur in Mexico.

Leaves linear..... 1. *J. linearis*.

Leaves much broader than linear.

Calyx glandular-pubescent.

Calyx covered with sessile glands..... 2. *J. hians*.

Calyx glandular-pilose..... 3. *J. salviaeflora*.

Calyx without glandular pubescence.

Bractlets spatulate, obtuse..... 4. *J. palmeri*.

Bractlets linear-subulate..... 5. *J. mexicana*.

1. *Justicia linearis* Robins. & Greenm. Amer. Journ. Sci. **50**: 161. 1895.

Type from Las Tablas, San Luis Potosí.

Plants tomentulose, fruticose; leaves 1-nerved, sessile, 2.5 cm. long, 2 mm. wide; flowers axillary, sessile; calyx 8 mm. long; corolla 18 mm. long, pubescent.

2. *Justicia hians* T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 194. 1915.

Beloperone hians T. S. Brandeg. Proc. Calif. Acad. II. **2**: 194. 1889.

Justicia insolita T. S. Brandeg. Proc. Calif. Acad. II. **2**: 195. 1889.

Baja California; type from Comondú.

Shrub, 1 to 2 meters high, the branches minutely whitish-puberulent; leaves short-petiolate, oblong to oval or lance-oblong, 1 to 3.5 cm. long, obtuse or acute, sparsely pubescent or glabrate; flowers in few-flowered interrupted spikes; corolla 2 to 2.5 cm. long.

Brandegee has referred *J. palmeri* Rose to synonymy under *J. hians*. A specimen of the latter species, presumably of the type collection, seen by the writer is identical with *J. insolita*.

3. *Justicia salviaeflora* H. B. K. Nov. Gen. & Sp. **2**: 233. 1817.

Justicia paniculata Rose, Contr. U. S. Nat. Herb. **1**: 348. 1895.

Jalisco to Oaxaca and Morelos; described from cultivated plants.

Plants suffrutescens, the branches glandular-pilose; leaves petiolate, lance-oblong or oblong-ovate, 5 to 8 cm. long, acuminate, acute at base, pubescent; flowers mostly in few-flowered secund spikes, sometimes cymose; corolla 1.5 to 2 cm. long, red.

4. *Justicia palmeri* Rose, Contr. U. S. Nat. Herb. **1**: 75. 1890.

Baja California; type from La Paz.

Shrub, 1 to 2 meters high, the branches minutely cinereous-tomentulose; leaves short-petiolate, ovate to lanceolate, 4 to 7 cm. long, obtusely acuminate, obtuse or acute at base, glabrous or nearly so; flowers fasciculate in the axils or in short leafy-bracted spikes; corolla red, 3 to 3.5 cm. long.

5. *Justicia mexicana* Rose, Contr. U. S. Nat. Herb. 1: 348. 1895.

Sonora and Sinaloa; type from Agiabampo, Sonora.

Slender shrub, 1 to 2 meters high, the branches pubescent or glabrate; leaves slender-petiolate, lanceolate or ovate, 4 to 10 cm. long, acuminate, acute or obtuse at base, sparsely pubescent or glabrate; flowers in terminal and axillary clusters; corolla red, 3 to 3.5 cm. long. "Mitle cimarrón" (Sinaloa).

This species and *J. palmeri* should probably be referred to the genus *Beloperone*.

16. *SIPHONOGLOSSA* Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1854: 159. 1855.

Several herbaceous species occur in Mexico.

1. *Siphonoglossa pringlei* (Robins. & Greenm.) Lindau, Bull. Herb. Boiss. 5: 662. 1897.

Carlwrightia pringlei Robins. & Greenm. Proc. Amer. Acad. 32: 50. 1896.

Oaxaca; type from Tomellín Canyon, altitude 1,050 meters.

Slender shrub, 1 to 1.5 meters high; leaves lanceolate or linear-lanceolate, 1.5 to 3 cm. long, acuminate, obtuse or rounded at base, petiolate, entire, glabrous or nearly so; flowers in slender interrupted spikes, the bracts small, subulate; calyx 5-cleft, the lobes linear-subulate, glandular-pubescent; corolla purplish, about 2 cm. long, the tube slender, equaling the 4 subequal lobes; stamens 2, the anther cells slightly unequal.

17. *BELOPERONE* Nees in Wall. Pl. Asiat. Rar. 3: 76. 1832.

Shrubs or herbs; leaves usually entire; flowers usually red, fasciculate in the axils of bracts or cymose, sometimes in terminal thyrses, the bracts small or large; calyx 5-parted, the segments narrow; corolla tube slender, elongate, scarcely ampliate above, the limb deeply bilabiate, the posterior lobes narrow, erect, entire or shallowly bilobate, the anterior one 3-lobate; stamens 2, the anther cells unequal, the lower one mucronate at base; ovules 2 in each cell.

Several herbaceous species occur in Mexico.

Branches glabrous or obscurely and sparsely puberulent.

Bracts much shorter than the calyx; leaves acute or acuminate. 1. *B. fragilis*.

Bracts longer than the calyx; leaves obtuse..... 2. *B. macrantha*.

Branches densely pilose or whitish-tomentulose.

Flowers borne in the axils of reduced leaves; seeds rugose.... 3. *B. purpusii*.

Flowers in naked racemes; seeds smooth..... 4. *B. californica*.

1. *Beloperone fragilis* Robinson, Proc. Amer. Acad. 27: 183. 1892.

Type from Las Canoas, San Luis Potosí.

Shrub, 1 to 1.5 meters high, the branches nearly glabrous; leaves petiolate, ovate, 4 to 7 cm. long, obtuse or rounded at base, barbate beneath along the costa, elsewhere glabrate; flowers in axillary or terminal, naked, secund spikes; calyx 4 mm. long; corolla reddish, 2.5 cm. long, pubescent.

2. *Beloperone macrantha* (Oerst.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 516. 1882.

Beloperonoides macrantha Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1854: 162. pl. 4, f. 36. 1855.

Type from Trapiche de la Concepción, Oaxaca.

Shrub, the branches puberulent in lines; leaves petiolate, lance-elliptic, about 7 cm. long, attenuate at base, crenulate toward the apex, glabrous; flowers terminal, fasciculate, sessile; calyx 8 mm. long; bracts spatulate; corolla puberulent, 5.5 cm. long.

Known to the writer only from description.

3. *Beloperone purpusii* T. S. Brandeg. *Zoe* 5: 172. 1903.

Southern Baja California; type from San Felipe.

Plants suffrutescent, the branches densely velutinous-pubescent; leaves short-petiolate or the upper sessile, ovate or broadly ovate, 3 to 10 cm. long, obtuse to acuminate, truncate or cordate at base, densely pubescent; inflorescence viscid-villous; corolla about 3 cm. long.

4. *Beloperone californica* Benth. *Bot. Voy. Sulph.* 38. 1844.

?*Beloperone californica conferta* T. S. Brandeg. *Proc. Calif. Acad.* II. 2: 194-1889.

Baja California, Sonora, and Sinaloa; type from Cape San Lucas, Baja California. Southern California.

Shrub, 2 meters high or less, often leafless, the branches whitish-tomentulose; leaves long-petiolate, oblong-ovate to rounded-ovate, 1 to 6.5 cm. long, obtuse or acute, rounded to cordate at base, pubescent, sometimes dentate; inflorescence viscid-puberulent or villous; corolla red, 3 to 3.5 cm. long. "Chuparosa" (Sonora).

The flowers are said to be eaten by the Papago Indians.

153. RUBIACEAE. Madder Family.

Shrubs or trees, or often herbs, sometimes armed with spines; leaves opposite or verticillate, entire, stipulate; flowers perfect or unisexual, large or small, usually regular; calyx inferior, the limb entire or lobate, rarely obsolete; corolla gamopetalous, the lobes valvate, imbricate, or contorted; stamens usually as many as the corolla lobes and alternate with them, inserted on the tube or throat of the corolla; style simple or 2 to 10-cleft; fruit capsular, baccate, or drupaceous, or of dehiscent or indehiscent cocci.

Numerous genera of the family are represented in Mexico only by herbaceous species. Among the most important members of the family are the species of *Cinchona*, a South American genus, which yield the Cinchona bark of commerce, from which quinine is extracted. Two or more species of *Cinchona* are cultivated in Veracruz, and perhaps elsewhere, having been introduced first at Córdoba.

A. Ovules more than one in each cell.

Fruit dry.

Seeds not winged or, if winged, horizontal.

Corolla lobes valvate.

Seeds horizontal, usually very numerous; large shrubs with large flowers.

1. **PORTLANDIA.**

Seeds vertical, few; small shrubs with small flowers.

2. **HOUSTONIA.**

Corolla lobes imbricate or contorted.

Corolla lobes imbricate.

Capsule half superior.....3. **RACHICALLIS.**

Capsule wholly inferior.....4. **RONDELETIA.**

Corolla lobes contorted.

Corolla tube short, shorter than the lobes.....5. **DEPPEA.**

Corolla tube elongate, usually much exceeding the lobes.

Corolla tubular; filaments elongate.....6. **OMILTEMIA.**

Corolla salverform or funnellform; filaments short.

Anthers exerted; corolla tube several times as long as the lobes.

7. **LINDENIA.**

Anthers included; corolla tube less than twice as long as the lobes.....8. **STYLOSIPHONIA.**

Seeds winged or appendaged, vertically imbricate.

Corolla open in bud, the lobes not touching.....9. **EXANDRA.**

Corolla closed in bud, the lobes valvate, imbricate, or contorted.

Corolla lobes valvate.

Flowers spicate.....10. **ALSEIS**.

Flowers not spicate.....11. **BOUVARDIA**.

Corolla lobes imbricate or contorted.

Calyx lobes dissimilar, one of them often expanded into a large white petiolate blade.....12. **CALYCOPHYLLUM**.

Calyx lobes all alike or nearly so, never expanded into a petiolate blade.

Corolla symmetric, the tube slender, the limb 4 or 5-lobate.

13. **EXOSTEMA**.

Corolla often asymmetric, the tube broad, often gibbous, the limb 6 to 8-lobate.....14. **COUTAREA**.

Fruit fleshy.

Corolla lobes valvate.

Inflorescence terminal.

Inflorescence spikelike; leaves thin.....16. **DUGGENA**.

Inflorescence not spikelike; leaves coriaceous.....17. **ISERTIA**.

Inflorescence axillary.

Leaves finely lineolate between the nerves.

Flowers in secund racemes.....18. **PLOCANIOPHYLLUM**.

Flowers not in secund racemes.....19. **SOMMERA**.

Leaves not lineolate.....20. **SABICEA**.

Corolla lobes imbricate or contorted.

Corolla lobes contorted.

Flowers perfect.

Corolla somewhat irregular, curved in bud....21. **POSOQUERIA**.

Corolla regular, not curved in bud.

Corolla tube villous within in both throat and base...22. **GENIPA**.

Corolla tube villous in either the throat or base but not in both.

24. **RANDIA**.

Flowers dioecious.

Staminate flowers terminal.....23. **ALIBERTIA**.

Staminate flowers lateral.....24. **RANDIA**.

Corolla lobes imbricate.

Calyx lobes unequal, one of them foliaceous.....25. **OTOCALYX**.

Calyx lobes equal or nearly so, none of them foliaceous.

Ovary 4 or 5-celled.....26. **HAMELIA**.

Ovary 2-celled.....27. **HOFFMANNIA**.

AA. Ovule one in each cell.

Seeds pendulous, the radicle superior.

Flowers in spherical compact heads; fruit dry....15. **CEPHALANTHUS**.

Flowers not in spherical heads; fruit often fleshy.

Stamens inserted in the throat of the corolla.

Fruit separating into 2 cocci at maturity.....28. **MACHAONIA**.

Fruit not separating into cocci at maturity.

Corolla lobes valvate.....29. **CHOMELIA**.

Corolla lobes imbricate.....30. **GUETTARDA**.

Stamens inserted at the base of the corolla tube.

Corolla lobes valvate.

Inflorescence terminal.....31. **ERITHALIS**.

Inflorescence axillary.

Flowers 5-parted; calyx lobes very short; flowers in racemes or panicles.....32. **CHIOCOCCA**.

- Flowers 4-parted; calyx lobes elongate; flowers fasciculate in the axils.....33. **ASEMNANTHE**.
- Corolla lobes imbricate.....34. **PLACOCARPA**.
- Seeds ascending, the radicle inferior.
- Corolla lobes contorted or imbricate.
- Corolla lobes contorted.....35. **COFFEA**.
- Corolla lobes imbricate.....36. **STRUMPFIA**.
- Corolla lobes valvate.
- Ovary 1-celled.....42. **FARAMEA**.
- Ovary with 2 or more cells.
- Fruit a syncarp, the flowers borne in a dense head, the calyces confluent.
43. **MORINDA**.
- Fruit not a syncarp, the flowers only rarely capitate.
- Plants scandent; fruit of 2 thin flat cocci.....41. **PAEDERIA**.
- Plants not scandent; fruit never of 2 flat cocci.
- Stipules not setiferous, never leaflike.
- Stipules, at least the upper ones, pectinately lobed.
37. **RUDGEA**.
- Stipules entire.
- Flowers in loose or dense heads surrounded by large, usually colored, foliaceous bracts.....39. **EVEA**.
- Flowers never in leafy-bracted heads.
- Corolla tube straight, not gibbous; branches of the inflorescence not yellow or reddish.....38. **PSYCHOTRIA**.
- Corolla tube usually somewhat curved or gibbous; branches of the inflorescence commonly yellowish or reddish.
40. **PALICOUREA**.
- Stipules setiferous, or sometimes leaflike.
- Stipules setiferous.
- Fruit of 2 united indehiscent cocci.....44. **ERNODEA**.
- Fruit of 2 dehiscent cocci.....45. **TRIODON**.
- Stipules similar to the leaves, the leaves thus appearing verticillate.....46. **GALIUM**.

1. PORTLANDIA P. Br.; L. Syst. Nat. ed. 10. 928. 1759.

REFERENCE: Standley, N. Amer. Fl. 32: 8-13. 1918.

Shrubs; leaves short-petiolate, coriaceous, persistent; flowers large, axillary or terminal, solitary or fasciculate; corolla funnelform, the lobes short, reduplicate-valvate; fruit capsular, 2-celled, loculicidally bivalvate; seeds numerous, compressed, angulate.

- Corolla about 2.5 cm. long, 4-lobate.....1. **P. ghiesbreghtiana**.
- Corolla 6 to 8 cm. long, 5-lobate.....2. **P. mexicana**.

1. Portlandia ghiesbreghtiana Baill. *Adansonia* 12: 300. 1879.

Courtaportia ghiesbreghtiana Urban, *Symb. Antill.* 9: 147. 1923.

Hidalgo, Puebla, and Oaxaca; type from Hacienda de Huijastla.

Glabrous shrub with resinous branches; leaves oblong-elliptic to oval-elliptic, 2 to 4.5 cm. long, acute or obtuse, acute at base; flowers numerous, short-pedicellate; corolla white; capsule 7 to 11 mm. long.

2. Portlandia mexicana (Zucc. & Mart.) Hemsl. *Diag. Pl. Mex.* 31. 1879.

Coutarea mexicana Zucc. & Mart.; *DC. Prodr.* 4: 350. 1830.

Nernstia mexicana Urban, *Symb. Antill.* 9: 146. 1923.

San Luis Potosí, Querétaro, and Hidalgo.

Glabrous shrub; leaves elliptic or elliptic-oblong, 3 to 7.5 cm. long, acute or obtuse, the margins revolute; capsule 1.3 to 2 cm. long.

2. **HOUSTONIA** L. Sp. Pl. 101. 1753.

REFERENCE: Standley, N. Amer. Fl. **32**: 24-38. 1918.

Small shrubs or usually herbs; leaves small; flowers small, axillary or in dichotomous cymes; calyx lobes 4; corolla funnelform or salverform, the limb 4-lobate, the lobes valvate; fruit a small 2-celled capsule, loculicidally dehiscent; seeds not winged.

Several herbaceous species occur in Mexico.

- Capsule less than half inferior.....1. **H. fasciculata**.
 Capsule more than half inferior.
 Branches glabrous.....2. **H. mucronata**.
 Branches hirtellous or scabrous.
 Flowers in cymes; leaves not acerose; corolla tube minutely hirtellous outside.....3. **H. peninsularis**.
 Flowers mostly solitary; leaves acerose; corolla tube glabrous.
 Leaves mostly verticillate; flowers sessile or nearly so.....4. **H. acerosa**.
 Leaves opposite; flowers mostly pedicellate.....5. **H. polypremoides**.

1. **Houstonia fasciculata** A. Gray, Proc. Amer. Acad. **17**: 203. 1882.

Chihuahua and Coahuila. Western Texas and southern New Mexico; type from Presidio, Texas.

Shrub, 40 cm. high or less, the branches scaberulous or hirtellous; leaves opposite or verticillate, linear, 3 to 10 mm. long, scaberulous or glabrate; flowers in small cymes; corolla white, 3 to 4 mm. long.

2. **Houstonia mucronata** (Benth.) Robinson, Proc. Amer. Acad. **45**: 401. 1910.

Hedyotis mucronata Benth. Bot. Voy. Sulph. **19**. 1844.

Houstonia fruticosa Rose, Contr. U. S. Nat. Herb. **1**: 132. 1892.

Southern Baja California; type from Magdalena Bay.

Glabrous shrub, 60 cm. high or less; leaves linear, 3 to 18 mm. long; flowers in small terminal cymes; corolla 10 to 12 mm. long, white.

3. **Houstonia peninsularis** T. S. Brandeg. Zoe **5**: 160. 1903.

Baja California; type from Sierra de la Trinidad.

Shrub, 30 cm. high or less; leaves linear, 1 to 4 cm. long, hirtellous; corolla purple, 15 mm. long.

4. **Houstonia acerosa** A Gray; Benth. & Hook. Gen. Pl. **2**: 60. 1873.

Hedyotis acerosa A. Gray, Pl. Wright. **1**: 81. 1852.

Mallostoma acerosum Hemsl. Biol. Centr. Amer. Bot. **2**: 31. 1881.

Coahuila, Nuevo León, and San Luis Potosí. Western Texas.

Plants fruticose or suffrutescent, 30 cm. high or less; leaves 5 to 12 mm. long, rigid, scaberulous or hirtellous; corolla 12 to 16 mm. long.

5. **Houstonia polypremoides** A Gray, Proc. Acad. Amer. **21**: 379. 1886.

Chihuahua; type from Santa Eulalia Mountains. Western Texas and southern New Mexico.

Shrub, 20 cm. high or less; leaves rigid, 5 to 12 mm. long, scaberulous or hirtellous; corolla white, 8 to 11 mm. long.

3. **RACHICALLIS** DC. Prodr. **4**: 433. 1830.

A single species is known.

1. **Rachicallis americana** (Jacq.) Hitchc. Rep. Mo. Bot. Gard. **4**: 92. 1893.

Hedyotis americana Jacq. Enum. Pl. Carib. **12**. 1760.

Yucatán, on coastal rocks. West Indies; type from Cuba.

Erect or procumbent shrub, 2 meters high or less; leaves linear-oblong to obovate, 2 to 8 mm. long, obtuse or acute, coriaceous; flowers yellow, solitary, sessile in the leaf axils; corolla salverform, 8 to 10 mm. long, sericeous, the limb 4-lobate; capsule 3 mm. long, septicidally bivalvate, many-seeded.

4. **RONDELETIA** L. Sp. Pl. 172. 1753.

REFERENCE: Standley, N. Amer. Fl. 32: 44-86. 1918.

Shrubs or small trees; flowers in terminal or axillary cymes, corymbs, or panicles; calyx 4 or 5-lobate; corolla funnelform or salverform, the tube slender, the limb 4 or 5-lobate, the lobes imbricate; fruit capsular, 2-celled, loculicidally or septicidally bivalvate, many-seeded; seeds often winged or appendaged.

Inflorescence wholly axillary.....1. **R. scabra**.

Inflorescence terminal, sometimes also axillary.

Corolla densely yellow-barbate in the throat.

Corolla glabrous outside.

Calyx lobes foliaceous, several times as long as the tube; leaves setose-pilose beneath.....2. **R. suffrutescens**.

Calyx lobes minute, shorter than the tube; leaves glabrous beneath except for tufts of hairs in the axils of the nerves.....3. **R. ligustroides**.

Corolla pubescent outside.

Branches acutely quadrangular; petioles 5 to 13 mm. long; leaves usually acute at base.....4. **R. stenosphon**.

Branches terete or subangulate; petioles very short; leaves obtuse to cordate at base.

Stipules triangular-subulate, 4 to 6 mm. long.....5. **R. gratissima**.

Stipules mostly oblong, foliaceous, 10 mm. long or longer, usually obtuse.

Leaves sparsely strigose beneath.....6. **R. intermedia**.

Leaves densely soft-pilose beneath.

Leaves broadly ovate or ovate-oval, usually subcordate at base; corolla tube 12 mm. long or less.....7. **R. amoena**.

Leaves elliptic or lance-elliptic, obtuse at base; corolla tube 15 mm. long.....8. **R. langlassei**.

Corolla usually naked in the throat, never yellow-barbate.

Inflorescence an elongate spikelike panicle.

Corolla variously pubescent outside but never tomentose.

Panicles shorter than the leaves, partly axillary; leaves glabrous.

9. **R. heteranthera**.

Panicles longer than the leaves, all terminal; leaves pilose-strigose beneath.....10. **R. capitellata**.

Corolla arachnoid-tomentose outside.

Leaves somewhat tomentose beneath when young but soon glabrate.

11. **R. septicidalis**.

Leaves densely tomentose beneath even in age.

Corolla tube 12 to 15 mm. long.

Secondary veins of the leaves obsolete; tomentum of the lower surface of the leaves white, very closely appressed.

12. **R. laniflora**.

Secondary veins prominent; tomentum loose, fulvous.

13. **R. bourgaei**.

Corolla tube 4 to 10 mm. long.

Leaves long-pilose beneath along the nerves; corolla tube 8 to 10 mm. long.....14. **R. villosa**.

Leaves not pilose beneath; corolla tube 4 to 8 mm. long.

15. **R. buddleoides**.

Inflorescence various but never an elongate spikelike panicle.

Corolla not arachnoid-tomentose outside.

Corolla pubescent outside.....16. **R. deamii**.

Corolla glabrous.

Stipules reniform, foliaceous, persistent; corolla tube 11 to 12 mm. long.....17. *R. galeottii*.

Stipules small, not foliaceous, deciduous; corolla tube 12 to 16 mm. long.....18. *R. jurgenseni*.

Corolla arachnoid-tomentose outside.

Inflorescence of numerous once bifid cymes arranged in a raceme, the flowers sessile, secund; stipules bidentate at apex...19. *R. rekoii*.

Inflorescence capitate or cymose-paniculate, the flowers often pedicellate, not secund; stipules entire.

Inflorescence capitate.....20. *R. leptodictya*.

Inflorescence cymose-paniculate.

Calyx lobes linear or oblanceolate, 3 to 6 mm. long.

21. *R. leucophylla*.

Calyx lobes orbicular-oblong, 0.5 to 1.5 mm. long...22. *R. nitida*.

1. *Rondeletia scabra* Hemsl. Diag. Pl. Mex. 29. 1879.

Type from Sierra San Pedro Nolasco, Oaxaca.

Leaves ovate-oblong, 7.5 to 10 cm. long, acute, attenuate at base, hispid-pilose beneath; cymes usually 3-flowered; corolla strigillose-pilose, the tube 12 mm. long.

2. *Rondeletia suffrutescens* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 70. 1914.

Type from Cerro del Boquerón, Chiapas.

Shrub; leaves short-petiolate, ovate to lance-oblong, 4.5 to 10 cm. long, long-acuminate or attenuate, rounded or abruptly short-acuminate at base; cymes mostly 3-flowered; corolla tube 17 mm. long.

3. *Rondeletia ligustroides* Hemsl. Diag. Pl. Mex. 26. 1879.

Veracruz; type from Orizaba.

Shrub, 2 to 2.5 meters high, the branches glabrous; leaves short-petiolate, broadly ovate to ovate-lanceolate, 4 to 8 cm. long, abruptly acuminate or attenuate, rounded to acute at base; inflorescence cymose-corymbose, few or many-flowered; corolla yellowish red, the tube 5 to 6 mm. long.

4. *Rondeletia stenosphon* Hemsl. Diag. Pl. Mex. 26. 1879.

Type from Yucatán or Tabasco. Guatemala.

Shrub; leaves short-petiolate, obovate to oval-oblong or elliptic-oval, 7 to 14 cm. long, abruptly short-acuminate, obtuse to acuminate at base, glabrous above, strigillose or glabrate beneath; inflorescence cymose-corymbose, many-flowered; corolla sericeous-strigillose, the tube 8 to 11 mm. long.

5. *Rondeletia gratissima* (Linden) Hemsl. Diag. Pl. Mex. 25. 1879.

Rogiera gratissima Linden; Planch. Fl. Serr. Jard. 15: 133. 1864.

Rogiera elegantissima Regel, Gartenflora pl. 490. 1865.

Chiapas.

Shrub; leaves oblong-elliptic, 5 to 6 cm. long, short-acuminate, rounded at base, glabrous; inflorescence cymose-corymbose, dense; corolla rosy white, sparsely puberulent, the tube 12 mm. long.

6. *Rondeletia intermedia* Hemsl. Diag. Pl. Mex. 26. 1879.

Oaxaca and Chiapas; type from Chiapas.

Shrub; leaves ovate or ovate-oval, 6 to 12 cm. long, acutish or obtuse, rounded or subcordate at base; inflorescence cymose-corymbose, the cymes few-flowered; corolla pinkish white, strigillose, the tube 8 to 10 mm. long.

7. *Rondeletia amoena* (Planch.) Hemsl. Diag. Pl. Mex. 26. 1879.

Rogiera amoena Planch. Fl. Serr. Jard. 5: 442. 1849.

Chiapas. Guatemala to Panama.

Shrub or small tree, the branchlets villous-pilose; leaves 6 to 15 cm. long, usually abruptly short-acuminate; inflorescence cymose-corymbose, 5 to 18 cm. broad; corolla pink or pinkish, densely appressed-pilose.

8. *Rondeletia langlassei* Standl. N. Amer. Fl. 32: 53. 1918.

Type from the Sierra Madre of Michoacán or Guerrero, altitude 1,750 meters.

Shrub or small tree, 3 to 4 meters high, the branchlets appressed-pilose; leaves 9 to 12.5 cm. long, acute or attenuate; inflorescence cymose-corymbose, 10 cm. broad; corolla pink, strigillose.

9. *Rondeletia heteranthera* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 387. 1913.

Type from Baños del Carrizal, Veracruz.

Shrub; leaves short-petiolate, ovate or broadly ovate, 6 to 10 cm. long, acuminate; panicles 2 to 4 cm. long; corolla minutely strigillose, the tube 2.5 to 3 mm. long.

10. *Rondeletia capitellata* Hemsl. Diag. Pl. Mex. 28. 1879.

Veracruz and Oaxaca.

Shrub or tree, 6 meters high or less; leaves short-petiolate, ovate to narrowly elliptic-oblong, 7.5 to 12 cm. long, acute or acuminate; corolla red, strigillose, the tube 6 to 8 mm. long.

11. *Rondeletia septicidalis* Robinson, Proc. Amer. Acad. 45: 403. 1910.

Type from Chicharras, Chiapas.

Shrub; leaves petiolate, broadly ovate to lanceolate, 5 to 16 cm. long, abruptly acuminate or attenuate, acute at base, glabrous above; panicles 6 to 10 cm. long; corolla red, the tube 6 to 8 mm. long.

12. *Rondeletia laniflora* Benth. Pl. Hartw. 85. 1841.

Mountains of Chiapas. Guatemala; type from Sierra de las Nubes.

Shrub, 2 to 3 meters high; leaves petiolate, obovate to narrowly lance-elliptic, 5.5 to 13 cm. long, attenuate or abruptly acuminate, acute or attenuate at base, glabrate above; panicles 4 to 7 cm. long; corolla white-tomentose, the tube 12 to 15 mm. long.

13. *Rondeletia bourgaei* Standl. N. Amer. Fl. 32: 56. 1918.

Type from San Cristóbal, region of Orizaba, Veracruz.

Shrub; leaves petiolate, obovate to oblong-elliptic, 6.5 to 11.5 cm. long, acute or acuminate at base and apex; panicles 6 to 10 cm. long.

14. *Rondeletia villosa* Hemsl. Diag. Pl. Mex. 27. 1879.

Oaxaca, Chiapas, and Tabasco; type from San Pedro Nolasco, Oaxaca.

Shrub; leaves petiolate, oblong-elliptic or ovate, 10 to 25 cm. long, acuminate, acute at base, sparsely pilose above; panicles 15 to 24 cm. long; corolla white, lanate.

15. *Rondeletia buddleoides* Benth. Pl. Hartw. 69. 1840.

Rondeletia affinis Hemsl. Diag. Pl. Mex. 28. 1879.

Veracruz and Oaxaca; type from Llano Verde, Oaxaca. Guatemala to Panama.

Shrub, 1 to 1.5 meters high; leaves short-petiolate, oval-elliptic to lanceolate, 5 to 12 cm. long, acute or long-acuminate, obtuse to long-acuminate at base, glabrate above; panicles 10 to 15 cm. long; corolla white-tomentose.

16. *Rondeletia deamii* (Donn. Smith) Standl. N. Amer. Fl. **32**: 60. 1918.
Bouvardia deamii Donn. Smith, Bot. Gaz. **49**: 455. 1910.
 Oaxaca. Guatemala; type from Fiscal.
 Shrub; leaves nearly sessile, ovate-orbicular to ovate, 2.5 to 6.5 cm. long, abruptly acuminate, rounded to acute at base, minutely pilose beneath; flowers mostly in 3-flowered cymes; corolla tube 7 to 12 mm. long.
17. *Rondeletia galeottii* Standl. N. Amer. Fl. **32**: 59. 1918.
 Type from somewhere in southern Mexico.
 Glabrous shrub; leaves short-petiolate, oval-obovate or oblong-obovate, 8 to 17 cm. long, acuminate, acute at base; inflorescence cymose-corymbose, 4 to 8 cm. broad.
18. *Rondeletia jurgenseni* Hemsl. Diag. Pl. Mex. 29. 1879.
 Type from Sierra San Pedro Nolasco, Oaxaca.
 Glabrous shrub; leaves short-petiolate, ovate-lanceolate, 5 to 7.5 cm. long, acuminate, cuneate at base; inflorescence cymose, 3.5 to 5 cm. broad.
19. *Rondeletia rekoii* Standl. Proc. Biol. Soc. Washington **8**: 126. 1918.
 Type from Hacienda Las Pilas, Cerro Espino, Oaxaca, altitude 400 meters.
 Leaves petiolate, ovate or elliptic-ovate, 8.5 to 19 cm. long, acute, rounded and short-decurrent at base, green above and scabrous, white-tomentose beneath; corolla tube 5.5 to 7 mm. long.
20. *Rondeletia leptodictya* Robinson, Proc. Amer. Acad. **45**: 402. 1910.
 Type from banks of the Río Petatlán, near the boundary between Michoacán and Guerrero, altitude 500 meters.
 Shrub, 2 meters high; leaves petiolate, broadly obovate to elliptic-oblong, 4 to 11 cm. long, abruptly acute or attenuate, acute or obtuse at base, white-tomentose beneath when young but glabrate in age; corolla red, the tube 12 to 14 mm. long.
21. *Rondeletia leucophylla* H. B. K. Nov. Gen. & Sp. **3**: 395. 1819.
Rondeletia elongata Bartl.; DC. Prodr. **4**: 409. 1830.
Bouvardia discolor Hook. & Arn. Bot. Beechey Voy. 428. 1840.
Rondeletia dubia Hemsl. Diag. Pl. Mex. 28. 1879.
Rondeletia leucophylla calycosa Greenm. Proc. Amer. Acad. **39**: 92. 1903.
 Sinaloa to Oaxaca; type collected between Alto del Peregrino and Río Papagalgo, Guerrero.
 Shrub, 1 to 3 meters high; leaves petiolate, ovate to narrowly lanceolate, 4 to 14 cm. long, acute, acute to rounded at base, white-tomentose beneath; flowers fragrant; corolla red. "Hierba de la muchachita" (Oaxaca); "huele de noche" (Sinaloa).
22. *Rondeletia nitida* Hemsl. Diag. Pl. Mex. 39. 1879.
 Chiapas.
 Leaves short-petiolate, narrowly lanceolate or lance-elliptic, 5 to 10 cm. long, long-acuminate at each end, white-tomentose beneath; panicles few-flowered; corolla pink.

DOUBTFUL SPECIES.

RONDELETIA SPINOSA Schum. Bull. Herb. Boiss **3**: 620. 1895. Type from Hidalgo. Probably not of this genus.

5. **DEPPEA** Schlecht. & Cham. Linnaea **5**: 167. 1830.

REFERENCE: Standley, N. Amer. Fl. **32**: 88-90. 1921.

Slender shrubs; leaves thin, petiolate; flowers small, yellow, in terminal or axillary cymes or umbels, sometimes solitary, pedicellate; calyx 4-lobate; corolla rotate or short-funnelform, the lobes contorted; fruit a small capsule, turbinate or obovoid, costate, 2-celled, loculicidal; seeds numerous, not winged.

Inflorescences 1 or 2-flowered.

Leaves 1 cm. long or less; calyx lobes obtuse.....1. *D. microphylla*.

Leaves 2.5 to 4.5 cm. long; calyx lobes acute.....2. *D. purpusii*.

Inflorescences few or many-flowered.

Inflorescence umbellate or subumbellate.

Capsule 2 mm. long, about as broad as long.....3. *D. umbellata*.

Capsule 3 to 4 mm. long, much longer than broad.....4. *D. excelsa*.

Inflorescence cymose-corymbose.

Corolla 2.5 mm. long.....5. *D. erythrorhiza*.

Corolla 4 to 10 mm. long.

Capsule oval, obscurely costate, puberulent; corolla 5 mm. long or less.

6. *D. pubescens*.

Capsule turbinate, conspicuously costate, glabrous; corolla 6 to 10 mm. long.

Buds and corolla lobes very acute or acuminate.....7. *D. cornifolia*.

Buds and corolla lobes obtuse or rounded.

Leaves 1.5 to 3.5 cm. long; lobes of the calyx about equaling the tube.....8. *D. obtusiflora*.

Leaves 5 to 15 cm. long; lobes of the calyx shorter than the tube.

9. *D. grandiflora*.

1. *Deppea microphylla* Greenm. Proc. Amer. Acad. 41: 249. 1905.

Type from Trinidad Iron Works, Hidalgo, altitude 1,710 meters.

Shrub; leaves petiolate, rhombic-ovate or oval-elliptic, 4 to 10 mm. long, obtuse, sparsely puberulent or glabrate beneath; corolla 5 mm. long, the lobes obtuse; capsule 3 mm. long.

2. *Deppea purpusii* Standl. N. Amer. Fl. 32: 88. 1921.

Type collected in the Sierra Madre between Misantla and Naolinco, Veracruz.

Shrub; leaves petiolate, ovate or oblong-ovate, acute, puberulent or villosulous beneath; capsule 3 to 4 mm. long, villosulous at first.

3. *Deppea umbellata* Hemsl. Diag. Pl. Mex. 31. 1879.

Veracruz; type from Orizaba.

Shrub; leaves long-petiolate, ovate or lance-ovate, 4 to 11.5 cm. long, acuminate, sparsely puberulent or glabrate beneath; corolla 2 to 3 mm. long.

4. *Deppea excelsa* (H. B. K.) Standl. N. Amer. Fl. 32: 89. 1921.

Psychotria excelsa H. B. K. Nov. Gen. & Sp. 3: 355. 1819.

Deppea tenuiflora Benth. Pl. Hartw. 349. 1857.

Veracruz and Chiapas; type from Jalapa, Veracruz.

Shrub; leaves petiolate, ovate to lance-oblong, 4 to 7.5 cm. long, acuminate, puberulent or sparsely pilose beneath, finally glabrate; corolla lobes obtuse.

5. *Deppea erythrorhiza* Schlecht. & Cham. Linnaea 5: 168. 1830.

Deppea hedyotideia DC. Prodr. 4: 618. 1830.

Veracruz and Oaxaca; type from Hacienda de la Laguna, Veracruz.

Slender shrub with pink wood; leaves long-petiolate, elliptic or ovate, 4 to 7 cm. long, acute or short-acuminate, glabrous or puberulent; capsule 2.5 to 3 mm. long.

6. *Deppea pubescens* Hemsl. Diag. Pl. Mex. 31. 1879.

Type from Santa Gertrudis.

Leaves long-petiolate, ovate or lance-oblong, 3.5 to 7.5 cm. long, acute or acuminate, villosulous or tomentose beneath; capsule 3 mm. long.

7. *Deppea cornifolia* Benth. Pl. Hartw. 349. 1857.

Rondeletia cornifolia Benth. Pl. Hartw. 39. 1840.

Michoacán and Mexico to Oaxaca; type from Morelia, Michoacán.

Shrub, about 1 meter high; leaves short-petiolate, ovate or lance-ovate, 1.5 to 4.5 cm. long, acute or acuminate, sparsely puberulent or glabrate beneath; corolla 8 to 11 mm. long; capsule 3.5 mm. long.

8. *Deppea obtusiflora* Benth. Pl. Hartw. 349. 1857.

Choristes obtusiflora Benth. Pl. Hartw. 63. 1840.

Oaxaca; type from Llano Verde.

Leaves short-petiolate, elliptic or elliptic-ovate, obtuse, acute at base, villosulous beneath along the nerves; corolla 8 to 9 mm. long.

9. *Deppea grandiflora* Schlecht. Linnaea 19: 748. 1847.

Deppea floribunda Hemsl. Diag. Pl. Mex. 31. 1879.

Veracruz, Oaxaca, and Chiapas. Costa Rica and Panama.

Shrub, 1 to 2.5 meters high; leaves slender-petiolate, oblanceolate to obovate or obovate-ovate, acuminate, puberulent or villosulous beneath; corolla 6 to 8 mm. long; capsule 3 to 5 mm. long.

6. **OMILTEMIA** Standl. Journ. Washington Acad. Sci. 8: 427. 1918.

A single species is known.

1. *Omitelia longipes* Standl. Journ. Washington Acad. Sci. 8: 427. 1918.

Type from Omiteme, Guerrero.

Shrub, about 3 meters high; leaves mostly ternate, short-petiolate, oblanceolate or oblanceolate-oblong, 3 to 7 cm. long, acute to long-attenuate, villosulous beneath along the nerves or glabrate; flowers red, axillary, solitary, long-pedicellate; calyx 4-lobate; corolla tubular, 4 cm. long, glabrous, the 4 lobes short, acuminate, contorted; capsule 2-celled, 14 mm. long, cylindric, the seeds numerous, angulate.

7. **LINDENIA** Benth. Pl. Hartw. 84. 1841.

A single species is known.

1. *Lindenia rivalis* Benth. Pl. Hartw. 84. 1841.

Lindenia acutiflora Hook. Icon. Pl. pl. 475. 1842.

Along streams, Michoacán to Veracruz, Tabasco, and Oaxaca. Guatemala to Panama; type from Alta Verapaz, Guatemala.

Shrub, 1 meter high or less; leaves crowded at the ends of the branches, short-petiolate, oblanceolate to linear-oblong, 3.5 to 16.5 cm. long, acute or attenuate, puberulent or pilosulous beneath, rarely glabrous; flowers short-pedicellate, in few-flowered terminal cymes; calyx tube elongate, 5-angulate, the limb 4-lobate; corolla white, salverform, the tube 10 to 16 cm. long, pilosulous, the lobes elliptic or oblong-oval, 2.5 to 3 cm. long, acute or obtuse; capsule 2-celled, pyriform, 1.2 to 2 cm. long; seeds numerous, small, angulate. "Pimienta de agua" (Oaxaca, *Reko*); "flor de María" (Guatemala); "lirio" (Costa Rica).

8. **STYLOSIPHONIA** T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 70. 1914.

A single species is known.

1. *Stylosiphonia glabra* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 70. 1914.

Type from Chiapas.

Shrub; leaves slender-petiolate, lanceolate, oblong-lanceolate, or oblanceolate, 6.5 to 14 cm. long, abruptly long-acuminate, acute or attenuate at base, sparsely short-pilose beneath along the nerves or glabrate; inflorescences axillary and terminal, cymose, few-flowered, pedunculate; calyx 5-lobate, the lobes narrow, glabrous; corolla salverform, glabrous, the tube slender, 18 mm. long, the 5 lobes lance-linear, contorted, more than half as long as the tube; capsule ovoid, 2-celled, 9 mm. long, the seeds numerous, angulate.

9. **EXANDRA** Standl. Journ. Washington Acad. Sci. 13: 292. 1923.

The genus consists of a single species.

1. **Exandra rhodoclada** Standl. Journ. Washington Acad. Sci. 13: 292. 1923.

Type collected between La Venta and Nilttepec, Oaxaca. Also in El Salvador.

Large shrub or tree; leaves slender-petiolate, rounded-ovate or rounded-oval, 20 to 30 cm. long, 16 to 25 cm. wide, short-acute or acuminate, cordate at base, minutely puberulent beneath upon the nerves; flowers in terminal paniced cymes, mostly sessile; corolla broadly funnelform, 4 to 5 mm. long; filaments long-exserted. "Brasil," "limpia-dientes" (El Salvador).

The exact position of the genus within the family is somewhat doubtful because of the lack of mature fruit. The wood turns red upon exposure to the air.

10. **ALSEIS** Schott; Spreng. Syst. Veg. 4: Cur. Post. 404. 1827.

Trees or shrubs; leaves petiolate; flowers small, white or yellow, spicate, the spikes simple or branched, axillary and terminal; calyx tube obconic, the limb 5-lobate, the lobes deciduous; corolla cylindric, short, pilose within, the limb 5-lobate, the lobes valvate; capsule oblong-turbinate, 2-celled, septically bivalvate; seeds linear-fusiform, appendaged at each end.

The writer has seen a single specimen of this genus, collected at Buena Vista Xbac, Yucatán, where the plant is said to be known as "cacaoché." The material consists only of leafless fruiting branches and consequently can not be determined specifically. It may represent an undescribed species or it may be *Alseis blackiana* Hemsl.¹, which occurs in Panama and Colombia.

11. **BOUWARDIA** Salisb. Parad. Lond. pl. 88. 1808.

REFERENCE: Standley, N. Amer. Fl. 32: 100-111. 1921.

Shrubs or herbs; leaves opposite or verticillate, usually short-petiolate; flowers commonly large, white, red, or yellow, cymose or cymose-corymbose, rarely solitary; calyx limb 4-lobate; corolla tubular or salverform, the limb 4-lobate; capsule didymous-globose, 2-celled, loculicidally bivalvate; seeds numerous, compressed, winged.

Nearly all the species are shrubby or suffrutescent, and for convenience there are included the few Mexican species which are, so far as known, always herbaceous.

Leaves all or mostly in verticels of 3 to 5. Corolla red.

Corolla glabrous outside.

Corolla lobes erect or ascending, 2 to 5 mm. long.

Upper leaves sessile or nearly so, short-villous or tomentulose beneath; corolla lobes 2 to 3 mm. long.....1. **B. leiantha.**

Upper leaves petiolate, puberulent, scaberulous, or glabrate beneath; corolla lobes 3 to 5 mm. long.....2. **B. bouvardioides.**

Corolla lobes widely spreading, 5 to 8 mm. long.

Stems and leaves villous or tomentulose with slender whitish hairs; calyx lobes 2.5 to 4.5 mm. long.....3. **B. viminalis.**

Stems and lower surface of the leaves villous with very coarse yellowish hairs; calyx lobes 8 to 12 mm. long.....4. **B. scabra.**

Corolla pubescent outside.

Leaves obovate, often 5-verticillate.....5. **B. obovata.**

Leaves not obovate, 3 or 4-verticillate.

Corolla tube glabrous within or sparsely villous, the hairs not collected in a dense ring.....6. **B. glaberrima.**

Corolla tube with a densely villous ring within near the base.

Leaves densely whitish-tomentose beneath.....7. **B. scabrida.**

¹ Diag. Pl. Mex. 30. 1879.

Leaves not tomentose beneath.

Leaves elongate-linear, 3 to 9 cm. long and 0.6 to 3.5 mm. wide, often glabrous.....8. *B. tenuifolia*.

Leaves not elongate-linear, if very narrow the blades usually less than 3 cm. long, usually lanceolate to ovate...9. *B. ternifolia*.

Leaves opposite.

Corolla lobes usually 3 to 5 mm. long, of an ovate or triangular-oblong type, mostly erect or ascending; corolla yellow, red, white, or greenish white, the tube 1 to 3.3 cm. long.

Inflorescences usually 3 or 5-flowered, simply cymose, sometimes 1-flowered; leaves pinnately nerved.

Corolla red or yellow.

Corolla lobes villous outside with coarse hairs; leaves mostly rounded-ovate and cordate or subcordate at base.....10. *B. subcordata*.

Corolla lobes glabrous outside; leaves not cordate at base.

Corolla tube glabrous within; leaves 2 to 3.5 mm. wide.

11. *B. macilenta*.

Corolla tube more or less villous within; leaves 5 mm. wide or wider.

Calyx tube densely puberulent or short-hirtellous, the lobes 2 to 4.5 mm. long; inflorescences mostly 3-flowered...12. *B. versicolor*.

Calyx tube glabrous or very sparsely villous or puberulent, the lobes 4 to 11 mm. long; inflorescences mostly with 5 or more flowers.

Corolla 1.3 to 1.5 cm. long.....13. *B. konzattii*.

Corolla 2.5 to 4 cm. long.

Pedicels 3 mm. long or shorter; leaves pale beneath, the lateral nerves mostly obsolete.....14. *B. chrysantha*.

Pedicels 6 to 28 mm. long; leaves subconcolorous, the lateral nerves evident.....15. *B. laevis*.

Corolla white or greenish white.

Corolla densely villous outside.....16. *B. villosa*.

Corolla glabrous outside.

Corolla tube 2.4 to 3.3 cm. long.....17. *B. macrantha*.

Corolla tube 1 to 2 cm. long.

Leaves, at least part of them, suborbicular, abruptly long or short-acuminate; pedicels 2 to 8 mm. long; corolla tube 1.8 to 2 cm. long.....18. *B. heterophylla*.

Leaves mostly ovate or lanceolate, not abruptly acuminate; pedicels 3 mm. long or shorter; corolla tube 1 to 1.5 cm. long.....19. *B. multiflora*.

Inflorescences many-flowered, compound; corolla tube usually 6 to 11 mm. long; leaves sometimes palmately nerved.

Leaves 3 or 5-nerved from the base.

Corolla hirtellous.....20. *B. quinquenervata*.

Corolla glabrous.

Calyx hirtellous.....21. *B. oaxacana*.

Calyx glabrous.....22. *B. rekoii*.

Leaves pinnately nerved; corolla (so far as known) glabrous.

Leaves puberulent beneath along the veins; calyx lobes 1 to 1.5 mm. long.....23. *B. gracilipes*.

Leaves glabrous; calyx lobes 2.5 to 3.5 mm. long...24. *B. dictyoneura*.

Corolla lobes mostly 7 to 25 mm. long, of an oblong or elliptic type, spreading, narrowed at base; corolla white, the tube often 4 cm. long or longer.

Leaves sessile, broadly ovate; calyx tube prolonged beyond the ovary.

25. *B. rosei*.

Leaves petiolate; calyx tube not prolonged beyond the ovary.

Corolla more or less villous outside.

Corolla densely villous outside.....26. *B. induta*.

Corolla villous only on the upper part of the tube....27. *B. langlassei*.

Corolla glabrous outside or pruinose-puberulent.

Leaves linear or lanceolate, 1.5 to 4 mm. wide; corolla pruinose-puberulent.....28. *B. erecta*.

Leaves mostly ovate or broadly ovate, more than 5 mm. wide; corolla glabrous.

Corolla tube 3 to 3.5 cm. long.....29. *B. latifolia*.

Corolla tube 4 to 8.5 cm. long.....30. *B. longiflora*.

1. *Bouvardia leiantha* Benth. Pl. Hartw. 85. 1841.

Chiapas. Guatemala to Costa Rica; type collected near Tejar and Chimaltenango, Guatemala.

Shrub; leaves nearly sessile, broadly ovate to ovate-oblong, 3 to 7 cm. long, acute or acuminate, short-villous or whitish-tomentose beneath; corolla deep red, the tube 12 to 16 mm. long.

2. *Bouvardia bouvardioides* (Seem.) Standl. N. Amer. Fl. 32: 102. 1921.

Hedyotis bouvardioides Seem. Bot. Voy. Herald 296. pl. 64. 1856.

Houstonia bouvardioides Benth. & Hook. Gen. Pl. 2: 60. 1873.

Mountains of Sinaloa, Durango, and Jalisco; type from the Sierra Madre.

Slender shrub, clambering to a height of 3 to 4.5 meters; leaves short-petiolate, ovate to lanceolate, 6 to 10 cm. long, long-acuminate; inflorescence many-flowered, 6 to 10 cm. broad; corolla red, the tube 10 to 15 mm. long. "Siguapatl" (Sinaloa).

3. *Bouvardia viminális* Schlecht. Linnaea 26: 120. 1853.

Puebla and Oaxaca.

Shrub, 1 meter high or less; leaves subsessile, broadly ovate to lance-oblong, 3 to 5.5 cm. long, acuminate; inflorescence dense, many-flowered; corolla red, the tube 15 to 17 mm. long.

4. *Bouvardia scabra* Hook. & Arn. Bot. Beechey Voy. 427. 1841.

Tepic and Jalisco; type from Tepic.

Plants chiefly or wholly herbaceous, 60 cm. high or less; leaves short-petiolate or sessile, elliptic-oval to ovate, 3.5 to 7.5 cm. long, rounded to acute at apex; inflorescence dense, 5 to 14 cm. broad; corolla red, the tube 17 to 21 mm. long. "Doncellita" (Loesener).

5. *Bouvardia obovata* H. B. K. Nov. Gen. & Sp. 3: 385. 1818.

Morelos and Mexico; type collected between Chapultepec and Texcoco, Mexico.

Plants herbaceous, 1 meter high or less, glabrous or nearly so; leaves short-petiolate, 5.5 to 12.5 cm. long, obtuse or acute; inflorescence many-flowered, dense; corolla red, the tube 25 to 33 mm. long.

6. *Bouvardia glaberrima* Engelm. in Wisliz. Mem. North. Mex. 106. 1849.

Bouvardia ovata A. Gray, Pl. Wright. 2: 67. 1853.

Sonora, Chihuahua, and Durango; type from Cosihuiriac, Chihuahua. Southern Arizona and New Mexico.

Shrub, 1 meter high or less, or often chiefly herbaceous; leaves short-petiolate, ovate or lanceolate, 2.5 to 10 cm. long, acute or acuminate, scaberulous or glabrous; cymes usually few-flowered; corolla red, the tube 20 to 32 mm. long.

7. *Bouvardia scabrida* Mart. & Gal. Bull. Acad. Brux. 11¹: 237. 1844.

Bouvardia hypoleuca Benth. Pl. Hartw. 288. 1848.

Jalisco to San Luis Potosí, Veracruz, and Oaxaca; type from ravine of Yavezia, Oaxaca.

Shrub, 60 cm. high or less, or sometimes herbaceous; leaves nearly sessile, lanceolate to linear, 1.5 to 6.5 cm. long, scabrous above; cymes usually few-flowered; corolla red, the tube 14 to 20 mm. long.

8. *Bouvardia tenuifolia* Standl. N. Amer. Fl. 32: 104. 1921.

Bouvardia endlichii Loesener, Repert. Sp. Nov. Fedde 18: 357. 1922.

Sinaloa to Jalisco; type from Guadalajara, Jalisco.

Stems usually simple and herbaceous, glabrous or rarely hirtellous; leaves subsessile, usually glabrous; cymes few or many-flowered; corolla red, the tube 20 to 25 mm. long. "Trompetilla" (Durango).

9. *Bouvardia ternifolia* (Cav.) Schlecht. Linnæa 26: 98. 1853.

Ixora ternifolia Cav. Icon Pl. 4: 3. pl. 305. 1797.

Ixora americana Jacq. Pl. Hort. Schönbr. 3: 4. pl. 257. 1798.

Houstonia coccinea Andr. Bot. Repos. pl. 106. 1800.

Bouvardia triphylla Salisb. Parad. Lond. pl. 88. 1808.

Bouvardia linearis H. B. K. Nov. Gen. & Sp. 3: 383. 1818.

Bouvardia angustifolia H. B. K. Nov. Gen. & Sp. 3: 384. 1818.

Bouvardia hirtella H. B. K. Nov. Gen. & Sp. 3: 384. 1818.

Bouvardia jacquini H. B. K. Nov. Gen. & Sp. 3: 385. 1818.

Bouvardia quaternifolia DC. Prodr. 4: 365. 1830.

Bouvardia splendens Graham in Curtis's Bot. Mag. pl. 3781. 1840.

Bouvardia tolocana Hook. & Arn. Bot. Beechey Voy. 427. 1841.

Bouvardia tenuiflora Schlecht. Linnæa 26: 97. 1853.

Bouvardia microphylla Schlecht. Linnæa 26: 112. 1853.

Bouvardia viperalis Schlecht. Linnæa 26: 114. 1853.

Bouvardia houtteana Schlecht.; Planch. Fl. Serr. Jard. 10: 149. 1855.

Hedyotis mexicana Sessé & Moc. Pl. Nov. Hisp. 15. 1887.

Hedyotis fruticosa Sessé & Moc. Fl. Mex. 22. 1893.

Sonora to Coahuila, Veraacruz, and Oaxaca. Western Texas.

Shrub, 1 meter high or less, or sometimes herbaceous; leaves sessile or short-petiolate, acute to long-attenuate, hirtellous, scabrous, or glabrate; cymes usually few-flowered; corolla red, the tube 15 to 32 mm. long. "Trompetilla" (Hidalgo, Mexico, Veraacruz, Oaxaca); "tlacoxochitl," "tlacosuchil" (Nahuatl; "trumpet-flower"); "mirto" (Coahuila, Durango); "mirto del campo" (Durango); "hierba del pasmo" (Sinaloa); "contrayerba" (Mexico); "donecellita" (Oaxaca, Reko); "hierba del indio" (Sinaloa).

A handsome plant and, like some of the other species, often cultivated. It is employed locally as a remedy for dysentery and hydrophobia and other affections.

Dr. Reko states that the ancient Mexicans were accustomed to begin the treatment of a disease by bleeding, which was induced by provoking hemorrhage from the nose with powder of "cebadilla" (*Stenanthium frigidum*); and to restrain excessive hemorrhage they used the powdered roots of the tlacoxochitl.

The plant is described and figured by Hernández.¹ It is probably also the one mentioned by Sahagún under the name tlacoxochitl. The latter author says: "The flavor of the roots is both bitter and sweetish. They are good for heat and exhaustion of the heart. Ground with about 15 grains of maize and as much cacao, and mixed with water, they should be taken several times on an empty stomach or after meals."

10. *Bouvardia subcordata* Standl. N. Amer. Fl. 32: 105. 1921.

Type collected between Rosario and Colomas, Sinaloa.

Shrub; leaves nearly sessile, broadly ovate or rounded-ovate, 2.5 to 4 cm. long, acute or obtuse, villous beneath; corolla red (?), sparsely villous, the tube 3 cm. long.

¹Thesaurus 231. 1651.

11. **Bouvardia macilentata** Blake, Contr. Gray Herb. n. ser. 53: 65. 1918.
Type from Cerro El Zopilote, Miahuatlán, Oaxaca, altitude 2,100 meters.
Leaves subsessile, lanceolate or ovate-lanceolate, 8 to 11 mm. long, glabrous beneath except at base of costa; corolla red, 2 cm. long, glabrous throughout.
12. **Bouvardia versicolor** Ker in Lindl. Bot. Reg. 3: pl. 245. 1817.
Bouvardia bicolor Kunze, Linnaea 20: 24. 1847.
Guanajuato and Michoacán to Oaxaca; described from cultivated plants.
Shrub, 1 to 2.5 meters high; leaves short-petiolate, mostly ovate, 2 to 8 cm long, acute or acuminate, obtuse or rounded at base, scaberulous or hirsutulous; corolla red or yellow, glabrous outside, the tube 22 to 34 mm. long.
13. **Bouvardia konzattii** Greenm. Proc. Amer. Acad. 39: 92. 1903.
Michoacán to Oaxaca; type from Oaxaca.
Shrub; leaves subsessile, ovate or ovate-lanceolate, 1.5 to 4 cm. long, acute or attenuate, puberulent beneath along the nerves; corolla red or yellowish red, glabrous outside.
14. **Bouvardia chrysantha** Mart. Del. Sem. Hort. Monac. 4. 1848.
?Bouvardia quinqueflora Dehnh.; Schlecht. Linnaea 26: 92. 1853.
Bouvardia myrtifolia Schlecht. Linnaea 26: 121. 1853.
Jalisco and Colima to Morelos; type from Santiaguillo, Mexico.
Shrub, 1 meter high or less; leaves sessile or subsessile, lance-oblong to broadly ovate, 1 to 4 cm. long, acute or obtuse, glabrous or sparsely villosulous beneath; corolla yellow, glabrous outside, the tube 2.5 cm. long.
15. **Bouvardia laevis** Mart. & Gal. Bull. Acad. Brux. 11¹: 236. 1844.
Bouvardia flava Decaisne, Fl. Serr. Jard. 1: 215. 1845.
Bouvardia mollis Linden; Schlecht. Linnaea 26: 55. 1853.
Mountains of Hidalgo and Veracruz; type collected near Zacuapan, Veracruz, altitude 900 meters.
Shrub, about 1 meter high; leaves short-petiolate, ovate or lance-ovate, 4 to 10.5 cm. long, acute or long-acuminate, glabrous or nearly so; corolla red or yellow, glabrous outside, the tube 25 to 32 mm. long.
16. **Bouvardia villosa** Standl. N. Amer. Fl. 32: 107. 1921.
Type from Alturas de Matatlán, Oaxaca, altitude 1,800 meters.
Shrub; leaves short-petiolate, oval to elliptic-oblong, 2 to 2.5 cm. long, obtuse or short-acuminate, whitish-villose beneath; corolla tube 17 to 20 mm. long.
17. **Bouvardia macrantha** Standl. N. Amer. Fl. 32: 107. 1921.
Jalisco to Puebla and Oaxaca; type from Tlacuilotepec, Puebla, altitude 2,100 meters.
Erect shrub; leaves short-petiolate, ovate or broadly ovate, 1 to 3 cm. long, obtuse to acuminate, rounded to acutish at base, sparsely scaberulous or villosulous beneath.
18. **Bouvardia heterophylla** Standl. N. Amer. Fl. 32: 107. 1921.
Jalisco. Guatemala; type from Santa Rosa.
Shrub; leaves short-petiolate, 2 to 4 cm. long, acuminate, obtuse to truncate at base, glabrous above, glabrous beneath, or sparsely puberulent along the nerves.
19. **Bouvardia multiflora** (Cav.) Schult. in Roem. & Schult. Syst. Veg. 3: 118. 1818.
Aeginetia multiflora Cav. Anal. Hist. Nat. (Madrid) 3: 130. 1801.
Bouvardia triflora H. B. K. Nov. Gen. & Sp. 3: 386. 1818.
Bouvardia cavanillesii DC. Prodr. 4: 366. 1830.
Anotis longiflora Benth. Pl. Hartw. 23. 1839.
?Bouvardia schiedeana Schlecht. Linnaea 26: 123. 1853.

Houstonia triflora A. Gray, Proc. Amer. Acad. 4: 314. 1860.

Bouvardia gracilis A. Gray, Proc. Amer. Acad. 22: 306. 1887.

Bouvardia versicolor graciliflora A. Gray in S. Wats. Proc. Amer. Acad. 22: 416. 1887.

Chihuahua to Jalisco, Guerrero, and Puebla.

Shrub, 1 to 1.5 meters high; leaves petiolate, 1.5 to 5 cm. long, obtuse or acute at base, finely puberulent or scaberulous; capsule 4 to 6 mm. broad.

20. *Bouvardia quinquenervata* Standl. N. Amer. Fl. 32: 108. 1921.

Chiapas; type from San Bartolomé.

Shrub; leaves short-petiolate, rounded-deltoid to ovate or lanceolate, 3.5 to 5.5 cm. long, acute or acuminate, obscurely puberulent along the nerves; corolla tube 6 to 8 mm. long.

21. *Bouvardia oaxacana* Standl. Journ. Washington Acad. Sci. 13: 7. 1923.

Type collected between Santa Cruz and El Aguacate, Distrito de Juquilla, Oaxaca.

Leaves short-petiolate, ovate or broadly ovate, 4 to 6 cm. long, acuminate, broadly rounded at base, sparsely puberulent or glabrate, conspicuously 5-nerved; corolla red, the tube about 17 mm. long, the oblong lobes 5 mm. long.

22. *Bouvardia rekoii* Standl. N. Amer. Fl. 32: 108. 1921.

Type from Cafetal Montecristo, Cerro Espino, Oaxaca, altitude 1,000 meters.

Slender shrub; leaves sessile, lanceolate or ovate, 3 to 6.5 cm. long, acuminate, glabrous; corolla tube 14 mm. long.

23. *Bouvardia gracilipes* Robinson, Proc. Amer. Acad. 45: 404. 1910.

Type from Tepic.

Slender shrub; leaves short-petiolate, ovate or lance-oblong, 3.5 to 6.5 cm. long, acuminate, rounded at base; capsule 4 to 6 mm. broad.

24. *Bouvardia dictyoneura* Standl. N. Amer. Fl. 32: 109. 1921.

Chiapas; type from Chicharras.

Slender shrub; leaves sessile or subsessile, lanceolate or lance-ovate, 3 to 9 cm. long, long-acuminate, rounded at base; corolla tube 11 mm. long.

25. *Bouvardia rosei* Standl. N. Amer. Fl. 32: 109. 1921.

Type from the Sierra Madre of Durango.

Shrub; leaves 2 to 3.5 cm. long, obtuse to short-acuminate, glabrous beneath; cymes mostly 3 or 5-flowered; corolla white, glabrous, the tube 4.5 to 6 cm. long.

26. *Bouvardia induta* (Robinson) Standl. N. Amer. Fl. 32: 109. 1921.

Bouvardia longiflora induta Robinson, Proc. Amer. Acad. 45: 404. 1910.

Chiapas.

Shrub, about 40 cm. high; leaves ovate or lance-ovate, 2 to 3 cm. long, acute or acuminate, villous-tomentose beneath; cymes mostly 3-flowered; corolla tube 4 to 5 cm. long.

27. *Bouvardia langlassei* Standl. N. Amer. Fl. 32: 110. 1921.

Guerrero and Puebla; type from Testla (Guerrero ?), altitude 1,500 meters.

Shrub, about 1 meter high; leaves ovate or lanceolate, 2 to 4 cm. long, obtuse to acuminate, hirtellous or villosulous beneath; flowers terminal, solitary; corolla white, the tube 4.5 to 5.5 cm. long.

28. *Bouvardia erecta* (DC.) Standl. N. Amer. Fl. 32: 110. 1921.

Catesbaea erecta DC. Prodr. 4: 401. 1830.

Hedyotis spinescens Sessé & Moc. Fl. Mex. 22. 1893.

Bouvardia flos-johannis Schum. Bull. Herb. Boiss. 3: 621. 1895.

Bouvardia flos-johannis latifolia Loesener, Repert, Sp. Nov. Fedde. 18: 358. 1922.

Puebla; type from Tehuacán.

Low shrub with stout spreading branches; leaves 5 to 16 mm. long, acute, scaberulous or glabrate; cymes mostly 3-flowered; corolla white, the tube 2 to 5.5 cm. long. "Hierba de San Juan."

29. *Bouvardia latifolia* Standl. N. Amer. Fl. **32**: 111. 1921.

Type from Monte de la Piedra, near Aguila, Guerrero, altitude 450 meters.

Shrub, 1.5 meters high; leaves broadly ovate, 2.5 to 4 cm. long, acute or acutish, finely puberulent beneath along the nerves or glabrous; corolla white.

30. *Bouvardia longiflora* (Cav.) H. B. K. Nov. Gen. & Sp. **3**: 386. 1820.

Aeginetia longiflora Cav. Anal. Hist. Nat. (Madrid) **3**: 130. 1801.

Houstonia longiflora A. Gray, Proc. Amer. Acad. **4**: 314. 1860.

Bouvardia purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. **10**: 415. 1924.

San Luis Potosí to Michoacán and Oaxaca; type material from Querétaro and Guanajuato.

Shrub, 1 to 1.5 meters high; leaves ovate or lanceolate, 2 to 4.5 cm. long, acute or acuminate, glabrous; flowers solitary, terminal and axillary; corolla white; capsule 8 mm. in diameter. "Flor de San Juan" (Querétaro, Hidalgo, Oaxaca); "rosa de San Juan" (Mexico).

The flowers are very fragrant. They are used for scenting ointments and similar preparations.

DOUBTFUL SPECIES.

BOUARDIA CORDIFOLIA DC. Prodr. **4**: 366. 1830. Type from somewhere in Mexico.

BOUARDIA ROSEA Schlecht. Linnaea **26**: 116. 1853. Type from San José de Oro.

BOUARDIA XYLOSTEOIDES Hook. & Arn. Bot. Beechey Voy. 428. 1841. Type from Oaxaca. Probably not of this genus.

12. *CALYCOPHYLLUM* DC. Prodr. **4**: 367. 1830.

1. *Calycophyllum candidissimum* (Vahl) DC. Prodr. **4**: 367. 1830.

Macrocnemum candidissimum Vahl, Symb. Bot. **2**: 38. 1791.

Guerrero to Chiapas and Campeche. Guatemala to Colombia; Cuba; type from Santa Marta, Colombia.

Tree, 5 to 20 meters high, the trunk sometimes 60 cm. in diameter; bark reddish gray, scaly or furrowed; leaves petiolate, rounded-oval to ovate, 4 to 13 cm. long, abruptly acuminate, acute or obtuse at base, glabrous or nearly so; flowers in terminal corymbs; calyx cylindric, the limb truncate, or often expanded into a large white slender-petiolate blade 1 to 3.5 cm. wide; corolla white, short-funnelform, the tube 3 mm. long, the 6 to 8 lobes slightly longer; capsule oblong-cylindric, 6 to 10 mm. long; seeds numerous, winged at each end; wood hard, heavy, very strong, fine-grained, durable, taking a good polish. "Camarón," "palo camarón" (Oaxaca); "dagame" (Cuba); "salamo" (Costa Rica, Guatemala, El Salvador); "alazano," "guayabo alazano," "harino" (Panama); "madroño" (Guatemala, Honduras, Costa Rica); "solano" (Honduras).

The wood is useful for carpentry and cabinet work. It is reported to have a specific gravity of about 1.02. It is very fine-grained, and for that reason is employed in Central America for making fine-toothed combs. When in flower the tree is a very handsome one, being almost completely covered with the showy white bracts, which persist for a long time.

13. *EXOSTEMA* L. Rich.; Humb. & Bonpl. Pl. Aequin. **1**: 131. 1808.

REFERENCE: Standley, N. Amer. Fl. **32**: 117-126. 1921.

Shrubs or trees; flowers small or large, axillary and solitary or in terminal corymbs or panicles; calyx tube cylindric or obovoid, the limb 5-lobate; corolla tube usually long and slender, the limb 5-lobate; capsule 2-celled, septicidally bivalvate; seeds numerous, winged.

Stamens included; corolla lobes short, rounded.....1. *E. coulteri*.

Stamens exerted; corolla lobes linear or oblong.

Flowers solitary in the leaf axils; corolla tube 3 to 5 cm. long...2. *E. caribaeum*.

Flowers in terminal many-flowered cymes; corolla tube 6 to 10 mm. long.

Corolla tube 8 to 10 mm. long; calyx sparsely puberulent.

3. *E. mexicanum*.

Corolla tube 6 mm. long; calyx densely puberulent.....4. *E. indutum*.

1. *Exostema coulteri* Hook. f.; Hemsl. Diag. Pl. Mex. 32. 1879.

Type from Zimapán, Hidalgo.

Glabrous shrub; leaves petiolate, ovate-oblong, 5 to 6 cm. long, acuminate, cuneate at base, coriaceous; flowers in terminal few-flowered corymbose cymes; corolla 12 to 16 mm. long; capsule 4 to 6 mm. long.

2. *Exostema caribaeum* (Jacq.) Roem. & Schult. Syst. Veg. 5: 19. 1819.

Cinchona caribaea Jacq. Enum. Pl. Carib. 16. 1760.

San Luis Potosí to Colima, Guerrero, and Yucatán. Southern Florida; West Indies and Central America.

Shrub or tree, sometimes 8 meters high; leaves petiolate, ovate to elliptic-oblong, 5 to 11 cm. long, acuminate, obtuse or acute at base, barbate beneath in the axils of the nerves, elsewhere glabrous; flowers pedicellate; corolla white, the lobes linear, recurved, about as long as the tube; capsule 1 to 1.5 cm. long; wood hard, strong, close-grained, brown with yellow streaks, its specific gravity about 0.93. "Sabae-ché" (Yucatán, Maya); "falsa quina" (Ramírez); "cuero de sapo," "lechillo" (Porto Rico); "macagua de costa," "cerillo," "cera amarilla" (Cuba).

Known in the Bahamas as "princewood." The wood is reported to be useful for cabinet work and turning, and is sometimes employed for torches. In former times the bark was much used as a febrifuge in place of Cinchona bark. It is said also to have emetic properties.

3. *Exostema mexicanum* A. Gray, Proc. Amer. Acad. 5: 180. 1861.

San Luis Potosí and Veracruz; type collected near Tantoyuca, Veracruz.

Small tree; leaves short-petiolate, ovate or oval, 4.5 to 15 cm. long, abruptly acuminate, obtuse or rounded at base; barbate beneath along the costa, elsewhere glabrous; corolla sparsely villosulous, the lobes 1 cm. long.

4. *Exostema indutum* Standl. N. Amer. Fl. 32: 126. 1921.

Type from Oaxaca.

Leaves short-petiolate, ovate or elliptic-oblong, 5.5 to 9 cm. long, abruptly acuminate, obtuse or acute at base, appressed-pilose or glabrate beneath; corolla yellow, puberulent or pilosulous, the lobes 7 to 9 mm. long.

DOUBTFUL SPECIES.

EXOSTEMA CANESCENS Bartl.; DC. Prodr. 4: 359. 1830. Type from somewhere in Mexico. Probably not of this genus.

14. *COUTAREA* Aubl. Pl. Guian. 1: 314. 1775.

REFERENCE: Standley, N. Amer. Fl. 32: 126-128. 1921.

Trees or shrubs; leaves petiolate; flowers large, terminal or axillary, solitary or cymose; calyx tube obovoid-turbinate, the limb 5 to 8-lobate; corolla funnel-form-campanulate, more or less oblique, the tube often curved and ventricose, the limb 5 to 8-lobate, the lobes short, plicate-imbricate or contorted; capsule more or less obcompressed, 2-celled, loculicidally bivalvate; seeds numerous, broadly winged.

Corolla 8-lobate, symmetric; calyx lobes usually 8. Capsule only slightly compressed; pedicels ebracteolate.....1. *C. octomera*.

Corolla 6-lobate; calyx lobes 6.

Corolla symmetric or nearly so, the tube not gibbous; capsule only slightly compressed; flowers solitary; stamens equaling or usually shorter than the corolla.

Pedicels ebracteolate; calyx lobes 6 to 10 mm. long; corolla lobes 6 to 10 mm. long, often half as long as the tube-----2. *C. latiflora*.

Pedicels bracteolate; calyx lobes 10 to 20 mm. long; corolla lobes about one-fourth as long as the tube.

Capsule 2 to 3 cm. long; corolla 6 to 8 cm. long; leaves mostly ovate or oval-----3. *C. pterosperma*.

Capsule 1.2 to 1.4 cm. long; corolla about 10 cm. long; leaves narrowly lance-oblong-----4. *C. lumaeana*.

Corolla asymmetric, the tube gibbous; capsule strongly compressed; flowers mostly in 3-flowered cymes; stamens longer than the corolla.

5. *C. hexandra*.

1. *Coutarea octomera* Hemsl. Biol. Centr. Amer. Bot. 4: 101. 1886.

Coutarea acamptoclada Robins. & Millsp. Bot. Jahrb. Engler 36: Beibl. 80: 28. 1905.

Yucatán; type from Cozumel Island.

Shrub; leaves short-petiolate, oval, rhombic-ovate, or oval-oblong, 1.5 to 5 cm. long, obtuse, cuneate or obtuse at base, glabrous or nearly so; corolla greenish yellow, 2.5 to 5 cm. long, glabrous; capsule 1.5 cm. long.

2. *Coutarea latiflora* Moc. & Sessé; DC. Prodr. 4: 350. 1830.

Southwestern Chihuahua to Guerrero, Oaxaca, and Puebla. Guatemala.

Shrub or small tree, 5 meters high or less; leaves petiolate, ovate or oval to oblong, 4 to 12 cm. long, obtuse or acuminate, rounded to acute at base, tomentose or pilose beneath or finally glabrate; flowers fragrant; corolla white, 5 to 7 cm. long, glabrous or pilose outside; capsule 2 cm. long, brown. "Quina" (Oaxaca, Guerrero); "copalchi" (Oaxaca); "falsa quina" (Michoacán, Ramírez); "campanilla" (Jalisco, Oliva); "palo amargo" (Sinaloa).

The bark is employed as a febrifuge.

3. *Coutarea pterosperma* (S. Wats.) Standl. N. Amer. Fl. 32: 127. 1921.

Portlandia pterosperma S. Wats. Proc. Amer. Acad. 24: 52. 1889.

Sonora and Chihuahua to Colima; type from Guaymas, Sonora:

Shrub or tree 1 to 15 meters high, the trunk 50 cm. or less in diameter; leaves slender-petiolate, ovate to oval or ovate-oblong, 4 to 10 cm. long, obtuse to short-acuminate, rounded to subacute at base, short-pilose or glabrous beneath, often barbate along the costa; corolla white, green when dry; capsule brown, oval, 6-costate. "Copalchi" (Colima); "palo amargo," "copalquín," "caparche" (Sinaloa).

The bark is employed for fevers, especially for malaria, and also for affections of the lungs.

4. *Coutarea lumaeana* Baill. Adansonia 12: 301. 1879.

Veracruz. Guatemala; type from mountains of western Guatemala.

Glabrous shrub; leaves short-petiolate, narrowly lance-oblong, 8 to 11.5 cm. long, acuminate, obtuse to acuminate at base; corolla white; capsule oval-globose, 6-costate.

5. *Coutarea hexandra* (Jacq.) Schum. in Mart. Fl. Bras. 6^o: 196. 1889.

Portlandia hexandra Jacq. Enum. Pl. Carib. 16. 1760.

Coutarea speciosa Aubl. Pl. Guian. 1: 314. pl. 122. 1775.

Coutarea flavescens Moc. & Sessé; DC. Prodr. 4: 350. 1830.

Oaxaca and Chiapas. Central and South America; type from Cartagena, Colombia.

Shrub or small tree, sometimes 5 meters high or more; leaves petiolate, ovate or elliptic-ovate, 5 to 12 cm. long, usually cuspidate-acuminate, rounded to acute at base, glabrous or short-pilose beneath; corolla white or yellowish, tinged below with purple; capsule 2 cm. long, dark brown. "Arbol de San Silvestre" (Nicaragua): "quina," "quinita," "quina blanca," "zalas" (El Salvador).

The bark is bitter and astringent, with properties similar to those of Cinchona bark, although less active. It was formerly much employed in medicine, being known as "quinquina de Cumaná" and "quinquina de Cartagena."

15. CEPHALANTHUS L. Sp. Pl. 95. 1753.

REFERENCE: Standley, N. Amer. Fl. **32**: 129-130. 1921.

Shrubs or small trees; leaves opposite or verticillate, short-petiolate; flowers small, white or yellow, sessile in dense globose heads; calyx 4 or 5-dentate, often glanduliferous; corolla tubular-funnelform, the limb 4 or 5-lobate, often with glands in the sinuses; fruit turbinate, 2 to 4-celled, the cells indehiscent, 1-seeded; seeds with a white aril at apex.

Calyx glabrous outside, or the tube with a few long white hairs at base.

1. *C. occidentalis*.

Calyx densely appressed-pubescent-----2. *C. salicifolius*.

1. *Cephalanthus occidentalis* L. Sp. Pl. 95. 1753.

Cephalanthus berlandieri Wernham, Journ. Bot. Brit. & For. **55**: 175. 1917.

Chihuahua to Veraacruz and Guerrero; reported from Tabasco. United States; Cuba; southern Asia.

Shrub or small tree, sometimes 15 meters high; leaves opposite or ternate, ovate to narrowly lanceolate, 6 to 19 cm. long, acuminate, rounded to acute at base, glabrous or pilose beneath; heads 6 to 12 mm. in diameter, long-pedunculate, axillary and terminal; corolla 5 to 9 mm. long; capsule 4 to 8 mm. long; wood light, rather hard and close-grained, pinkish brown. "Jazmín" (Michoacán, Guerrero); "uvero" (Tabasco, *Roviroso*).

Known in the United States as "buttonbush." The bark is bitter, with tonic and laxative properties, and has been employed for periodic fevers. A poisonous principle, cephalanthin, which destroys the blood corpuscles and causes violent vomiting, convulsions, and paralysis, has been separated from it. The bark has been used also for palsy, coughs, and venereal and cutaneous diseases. The plant is said to yield a yellow dye.

2. *Cephalanthus salicifolius* Humb. & Bonpl. Pl. Aequin. **2**: 63. 1809.

Cephalanthus occidentalis salicifolius A. Gray, Syn. Fl. **1**²: 29. 1878.

Cephalanthus peroblongus Wernham, Journ. Bot. Brit. & For. **55**: 176. 1917.

Sonora to Guerrero, Morelos, and Tamaulipas; type from Acapulco, Guerrero. Honduras.

Shrub or small tree; leaves elliptic-oblong to linear-lanceolate, 5 to 12 cm. long, rounded to attenuate at apex, acute to subcordate at base, glabrous or nearly so; heads 6 to 8 mm. long, long-pedunculate; corolla 6 to 7 mm. long; capsule 4 to 5 mm. long. "Mimbre" (Sinaloa); "botoncillo" (Honduras); "jazmín blanco" (Nayarit).

16. DUGGENA Vahl; West, Bidr. Beskr. St. Croix 269. 1793.

REFERENCE: Standley, N. Amer. Fl. **32**: 133-137. 1921.

1. *Duggena panamensis* (Cav.) Standl. Contr. U. S. Nat. Herb. **18**: 126. 1916.

Gonzalea panamensis Spreng. Syst. Veg. **1**: 417. 1825.

Gonzalagunia panamensis Schum. in Mart. Fl. Bras. **6**^o: 292. 1889.

Michoacán to Oaxaca and Veraacruz. Cuba; Central America and Colombia; type from Ancón Hill, Panama.

Slender shrub, 3 meters high or less; leaves petiolate, ovate or lanceolate, 7 to 14 cm. long, acuminate, acute, or obtuse at base, pilose or glabrate beneath; inflorescence dense, spikelike, 8 to 24 cm. long; calyx 4-lobate; corolla white, salverform, 10 to 17 mm. long, the tube slender, glabrous or sparsely pilose; fruit globose, tetracoccous, 3 to 4 mm. broad, fleshy at maturity and black; seeds numerous, minute.

DOUBTFUL SPECIES.

DUGGENA NIVEA (Bartl.) Standl. Contr. U. S. Nat. Herb. **18**: 125. 1916. *Gonzalea nivea* Bartl.; DC. Prodr. **4**: 436. 1830. Described from Mexico. Probably a species of *Rondeletia*.

GONZALAGUNIA PARVIFLORA Schlecht. & Cham. Linnaea **6**: 414. 1831. Type from Cuesta Grande de Jalacingo, Veraacruz.

GONZALEA SECUNDA Mart. & Gal. Bull. Acad. Brux. **11**¹: 235. 1844. Type from Jalapa, Veraacruz. Probably a synonym of *Duggena panamensis*.

17. *ISERTIA* Schreb. Gen. Pl. **1**: 234. 1789.

1. *Isertia haenkeana* DC. Prodr. **4**: 437. 1830.

Described originally from Mexico, but the species has not been collected recently in Mexico, and the locality may have been given incorrectly. Guatemala to Colombia; Cuba.

Shrub, 2 to 3 meters high; leaves short-petiolate, obovate or oblong-obovate, 20 to 45 cm. long, acuminate, acute at base, densely short-pilose or glabrate beneath; inflorescence cymose-paniculate, 7 to 20 cm. long; calyx shallowly 4 to 6-dentate; corolla tubular-funnelform, yellow or orange-red, 2 to 3.5 cm. long, the lobes short; fruit baccate, purplish, depressed-globose, 5 to 6 mm. broad; seeds minute, numerous. "Canelito" (Panama).

18. *PLOCANIOPHYLLON*. T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 69. 1914.

A single species is known.

1. *Plocaniophyllum flavum* T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 69. 1914. Type from Finca Mexiquito, Chiapas.

Slender glabrous shrub; leaves short-petiolate, elliptic to lance-oblong, 2.5 to 5 cm. long, acute to long-acuminate, acute at base, thin, conspicuously lineolate; flowers yellow, in simple secund racemes; calyx 4-lobate; corolla salverform, the tube 2.5 mm. long, the lobes 3 to 4 mm. long, narrowly oblong, acute; fruit fleshy (?), oblong-turbinate, 6 mm. long; seeds numerous, minute.

19. *SOMMERA* Schlecht. Linnaea **9**: 602. 1834.

REFERENCE: Standley, N. Amer. Fl. **32**: 143-145. 1921.

Shrubs or small trees; leaves petiolate, thin, with numerous fine parallel nerves between the veins; flowers white, in axillary pedunculate cymes, corymbs, or racemes; calyx 4 or 5-lobate, the lobes somewhat foliaceous; corolla funnelform or subcampanulate, sericeous outside, the 4 or 5 lobes valvate; fruit baccate, 2-celled; seeds numerous, minute.

Leaves quite glabrous on the upper surface; branchlets glabrous or nearly so.

Calyx lobes lanceolate or lance-oblong, acuminate; cymes mostly 3-flowered.

Leaves acute at base..... **1. *S. arborescens***.

Calyx lobes oval or suborbicular, rounded at apex; inflorescence with more than 3 flowers.

Inflorescence racemose; leaves acute at base..... **2. *S. chiapensis***.

Inflorescence cymose-corymbose; leaves obtuse to subcordate at base.

3. *S. subcordata*.

Leaves sparsely or densely pilose on the upper surface; branchlets pilose.

4. *S. grandis*.

1. *Sommerera arborescens* Schlecht. *Linnaea* 9: 602. 1834.

Veracruz; type from Hacienda de la Laguna.

Leaves obovate-oblong or elliptic-oblong, 10 to 25 cm. long, acuminate, sericeous beneath along the nerves; calyx lobes 5 to 9 mm. long; fruit oval, 12 to 14 mm. long.

2. *Sommerera chiapensis* T. S. Brandeg. *Univ. Calif. Publ. Bot.* 6: 196. 1915.
Type from Finca Irlanda, Chiapas.

Leaves obovate or obovate-oblong, 12 to 27 cm. long, abruptly acuminate, densely sericeous beneath when young, later glabrate.

3. *Sommerera subcordata* Standl. *N. Amer. Fl.* 32: 144. 1921.

Sinaloa; type from Colomas.

Shrub or small tree, 6 meters high or less; leaves oval-obovate or oval-elliptic, 12 to 30 cm. long, acute or short-acuminate, sparsely setose-pilose beneath.

4. *Sommerera grandis* (Bartl.) Standl. *N. Amer. Fl.* 32: 145. 1921.

Petesia grandis Bartl.; *DC. Prodr.* 4: 395. 1830.

Sommerera mesochora Standl. *Contr. U. S. Nat. Herb.* 17: 437. 1914.

Michoacán and Colima. Guatemala to Panama.

Shrub or small tree, sometimes 8 meters high; leaves obovate to oval, 10 to 22 cm. long, abruptly acuminate, rounded to attenuate at base, appressed-pilose beneath; inflorescence cymose-corymbose, usually many-flowered; corolla white, 5 to 8 mm. long.

20. *SABICEA* Aubl. *Pl. Guian.* 1: 192. 1775.

REFERENCES: Wernham, A monograph of the genus *Sabicea*, 1914; Standley, *N. Amer. Fl.* 32: 148-150. 1921.

Shrubs, usually scandent; flowers small, capitate or cymose, axillary; calyx tube subglobose, the limb 3 to 6-lobate, the lobes narrow, persistent; corolla funnelliform or salverform, the throat villous, the limb 4 or 5-lobate, the lobes short, valvate; fruit baccate, 2 to 5-celled; seeds numerous, minute.

Inflorescence lax at maturity, the flowers pedicellate. 1. *S. mexicana*.

Inflorescence dense, the flowers sessile.

Stipules broadly ovate, 5 to 10 mm. long; leaves hirsute or strigose.

2. *S. hirsuta*.

Stipules setaceous, 2 to 3 mm. long; leaves puberulent or glabrate.

3. *S. flagenioides*.

1. *Sabicea mexicana* Wernham, *Monogr. Sabicea* 41. 1914.

Oaxaca.

Branches pilose with subappressed hairs; leaves petiolate, lance-oblong to ovate, 8 to 12 cm. long, acuminate, obtuse or acute at base, hirsute; calyx lobes 6 to 10 mm. long; corolla white, strigose, the tube 10 to 12 mm. long.

Reported by Hemsley as *S. glabrescens* Benth.

2. *Sabicea hirsuta* H. B. K. *Nov. Gen. & Sp.* 3: 417. 1820.

Veracruz and Chiapas. Central and South America; type from the Orinoco River.

Branches hirsute or pilose; leaves ovate to elliptic-oblong, 5 to 12 cm. long, acuminate, rounded or obtuse at base; calyx lobes 2 to 4 mm. long; corolla white, hirsute or strigose, the tube 6 mm. long; fruit 1 cm. in diameter.

Reported by Hemsley as *S. hirta* Swartz.

3. *Sabicea flagenioides* Wernham, *Monogr. Sabicea* 57. 1914.

Type from Chichankanab, Yucatán.

Branches tomentulose when young; leaves lanceolate, 5 cm. long, acuminate; calyx lobes 4.5 mm. long.

Tocoyena latifolia Lam. Tabl. Encycl. 2: 259. 1793.*Posoqueria coriacea* Mart. & Gal. Bull. Acad. Brux. 11¹: 240. 1844.

Oaxaca; reported from Tabasco. Central and South America; Cuba (?).

Glabrous tree, sometimes 6 meters high; leaves short-petiolate, oval to oblong, 8 to 25 cm. long, acute or short-acuminate, obtuse or rounded at base, coriaceous; flowers white, in terminal corymbs; calyx with 5 short rounded lobes; corolla salverform, the slender tube 12 to 16.5 cm. long, the 5 lobes oblong, 1.5 to 2.5 cm. long, obtuse; fruit baccate, globose, 4 to 5 cm. in diameter, yellow; seeds numerous, irregularly angulate, black, about 1 cm. long. "Palo de peine blanco" (Tabasco ?); "jasmín de árbol" (Nicaragua); "boca vieja" (Panama); "guayaba de mico" (Costa Rica); "fruta de murciélago," "fruta de mono," "huevo de mono" (Panama).

The fruit is sometimes eaten, but its flavor is poor.

22. **GENIPA** L. Syst. Nat. ed. 10. 931. 1759.

REFERENCE: Standley, N. Amer. Fl. 32: 155-157. 1921.

- 1.
- Genipa americana**
- L. Syst. Nat. ed. 10. 931. 1759.

Genipa caruto H. B. K. Nov. Gen. & Sp. 3: 407. 1818.*Genipa americana caruto* Schum. in Mart. Fl. Bras. 6⁶: 352. 1889.

Guerrero to Chiapas. West Indies; Central and South America.

Tree, sometimes 15 meters high; leaves short-petiolate, obovate to oblong, 14 to 35 cm. long, acute or obtuse, attenuate to base, pubescent or glabrous beneath; flowers in few-flowered, axillary or terminal cymes; calyx truncate or shallowly crenate; corolla salverform, yellowish white, 2 to 4.5 cm. long, the 5 or 6 lobes longer than the tube; fruit baccate, subglobose, 6 to 7 cm. in diameter; seeds numerous, compressed, 6 to 12 mm. long, dark brown. "Maluco" (Oaxaca); "jagua blanca," "jagua azul" (Tabasco); "jagua" (Oaxaca, Tabasco, Veracruz, Panama, Venezuela, Nicaragua, Cuba, Porto Rico); "caruto" (Venezuela); "irayol" (Guatemala, El Salvador); "tapaculo," "yigualti," "gigualti" (Nicaragua); "tife-dientes" (El Salvador).

The typical form of the species is glabrous. The form occurring in Mexico is *G. americana caruto*, which is distinguished by its copious pubescence.

The wood is said to be soft but strong and resistant, flexible, fibrous, whitish tinged with gray; its specific gravity is reported as ranging from 0.73 to 0.87. It is used for carts, gun-stocks, axe handles, and other articles. The bark is said to be rich in tannin and it has been employed for tanning. A gum is produced from incisions in the trunk. The leaves are eaten by cattle.

The fruit is brown or green tinged with brown, with a leathery skin and scant acid pulp. The copious juice colors everything it touches brownish or blackish violet. The pulp is eaten by domestic animals and also by human beings, and is used in the preparation of a refreshing drink, and has been fermented to produce an alcoholic beverage. The juice was much used by the early inhabitants of tropical America for coloring cloth and utensils and for painting the skin. A decoction of the roots was formerly employed in the West Indies as a remedy for gonorrhoea, and in El Salvador the fruit is considered a remedy for jaundice.

The earliest account of the tree is that of Oviedo (Lib. VIII, Cap V), who speaks of it as follows: "The *Xagua* is a handsome large tree, and I have seen made of it fine lance handles, as long and thick as were wanted; it is a heavier wood than ash, and very common in Hispaniola and other islands and in the Spanish Main. They are high straight trees like the ashes, beautiful to see, and the handles made from them are of pretty complexion, and in color pale brown

to tawny. In Hispaniola, although there are some of these trees, they are neither so numerous nor so well suited as in Tierra-Firme, in the Province of Cueva or of Castilla del Oro, for the making of lances. They produce a fruit as large as a poppy pod, and very similar except in the crown, which the *Xagua* does not have. It is good to eat when ripe and seasoned; from it is obtained a clear juice with which the Indians bathe their limbs and sometimes the whole body, when tired. And also for their pleasure they paint themselves with the juice, which, aside from being astringent, turns everything it touches as black as fine and polished jet, or even blacker; and this dye can not be removed for 15 or 20 days or more; and often the nails are black until they are renewed if they are wet in the juice; all of which I have seen many times. * * * They are accustomed to play a joke upon the women, wetting them carelessly with *Xagua* juice mixed with other scented ones; and after a little there come out spots over their bodies, and the women, not knowing the cause of the spots, are frightened into seeking a remedy for them; and the remedies are harmful, and likely to burn or blister the face and body where the spots are but not to remove them until the passage of the 20 days, as I have said above, when little by little the dye disappears. When the Indians of Tierra-Firme prepare for battle, they paint their bodies with *Xagua* and with *Bixa*, which is a red dye. And the Indian women also when they wish to appear well decorate themselves with one or both colors; but to my eyes they appear little better than devils when they are thus adorned."

23. ALIBERTIA A. Rich.; DC. Prodr. 4: 443. 1830.

1. *Alibertia edulis* (L. Rich.) A. Rich.; DC. Prodr. 4: 443. 1830.

Genipa edulis L. Rich. Act. Soc. Hist. Nat. Paris 1: 107. 1792.

Cordia edulis Kuntze, Rev. Gen. Pl. 1: 279. 1891.

Oaxaca and Chiapas; reported from Tabasco. Central and South America; Cuba and Martinique; type from French Guiana.

Shrub or small tree, 1 to 6 meters high; leaves short-petiolate, lance-oblong to oval-ovate, 6 to 20 cm. long, usually short-acuminate, acute to rounded at base, coriaceous, glabrous or nearly so; flowers white, dioecious, terminal, sessile; calyx denticulate; corolla salverform, 2 to 3 cm. long, sericeous, the 4 or 5 lobes acuminate; fruit baccate, globose, about 2.5 cm. in diameter, yellowish, containing 2 or more cells; seeds numerous, compressed, 5 mm. broad, brownish. "Costarica" (Tabasco, *Ramirez*); "madroño de comer" (Costa Rica); "perita" (Columbia); "pitajoni," "pitajoni hembra" (Cuba); "torolillo" (El Salvador); "trompo," "trompito," "madroño" (Panama); "guayaba del monte" (Guatemala).

The fruit is edible but not agreeable in flavor.

24. RANDIA L. Sp. Pl. 1192. 1753.

Trees or shrubs, usually armed with spines; flowers small or large, perfect or dioecious, solitary or fasciculate, axillary or terminal, usually white or yellowish; calyx lobate or truncate; corolla funnelliform or salverform, the tube short or elongate; fruit baccate, 2-celled; seeds few or numerous, immersed in pulp, usually horizontal, compressed.

Flowers and fruit large; corolla 2.5 to 14 cm. long; fruit 3 to 9 cm. long, rarely only 2 cm. long (probably immature).

Fruit covered with long spinelike tubercles.....1. **R. echinocarpa.**

Fruit smooth.

Plants unarmed.....2. **R. laevigata.**

Plants armed with spines.

Corolla glabrous outside; leaves glabrous beneath or pubescent along the veins; flowers often pedicellate.

Tube of the corolla about as long as the lobes; leaves glabrous beneath.

3. **R. longiloba.**

- Tube of the corolla about twice as long as the lobes; leaves appressed-pilose beneath, at least along the costa.....4. *R. armata*.
 Corolla pubescent outside; leaves usually pubescent beneath over the whole surface; flowers sessile.
 Corolla lobes rhombic-ovovate; leaves abruptly attenuate to the base.
 5. *R. tetracantha*.
 Corolla lobes never obovate; leaves not abruptly attenuate to the base.
 Lower surface of leaves not tomentose.....6. *R. albonervia*.
 Lower surface of leaves densely tomentose, at least when young.
 Corolla tube 5.5 to 6 cm. long.....7. *R. cinerea*.
 Corolla tube 1.5 to 2 cm. long.
 Spines in pairs; leaves 3.5 cm. long or less, rounded at apex.
 8. *R. nelsonii*.
 Spines mostly in 4's; leaves usually more than 3.5 cm. long, sometimes acute.
 Corolla tube 1.5 cm. long; leaves mostly acute or acutish, 0.8 to 2.3 cm. wide.....9. *R. purpusii*.
 Corolla tube 2 cm. long; leaves mostly rounded at apex, 1.5 to 7.5 cm. wide.....10. *R. watsoni*.
 Flowers and fruit small; corolla 0.4 to 2 cm. long; fruit usually 0.6 to 2 cm. long, rarely slightly larger.
 Plants unarmed.
 Corolla glabrous outside; leaves sessile.....11. *R. blepharophylla*.
 Corolla pubescent; leaves petiolate.....12. *R. pringlei*.
 Plants armed with spines.
 Throat of the corolla densely white-barbate.
 Pericarp thin, black, lustrous, succulent.....13. *R. rhagocarpa*.
 Pericarp thick and hard, never black or succulent.
 Fruit 1.6 to 2.5 cm. in diameter; leaves mostly orbicular-spatulate.
 26. *R. thurberi*.
 Fruit 0.6 to 1.3 cm. in diameter; leaves not orbicular-spatulate.
 Spines scattered in pairs along the branches. Fruit 6 to 8 mm. in diameter; seeds 2 to 4.....25. *R. obcordata*.
 Spines mostly in pairs at the ends of the branchlets...14. *R. mitis*.
 Throat of the corolla naked, sometimes sparsely pilosulous but never white-barbate.
 Calyx truncate.....15. *R. truncata*.
 Calyx lobate.
 Pericarp thin, black, lustrous, succulent.....13. *R. rhagocarpa*.
 Pericarp thick and hard, never black and lustrous.
 Spines all or mostly in pairs at the ends of the branchlets.
 Fruit and calyx tube densely pilose with spreading hairs.
 16. *R. malacocarpa*.
 Fruit and calyx tube glabrous or appressed-pilose.
 Leaves densely puberulent beneath.....17. *R. induta*.
 Leaves glabrous beneath or puberulent only along the costa.
 Corolla 14 to 20 mm. long; fruit 2 to 2.5 cm. long.
 18. *R. xalapensis*.
 Corolla 6 to 12 mm. long; fruit 0.7 to 2 cm. long.
 Corolla 6 to 7 mm. long; flowers solitary.
 19. *R. chiapensis*.
 Corolla 7 to 11 mm. long; flowers often clustered.
 20. *R. laetevirens*.

Spines scattered in pairs along the branches.

Leaves densely long-pilose; corolla pilose outside.

21. *R. canescens*.

Leaves glabrous or sparsely short-pilose; corolla (so far as known) glabrous outside.

Lateral nerves of the leaves 5 or 6 on each side, conspicuous.

Leaves pilose beneath along the costa; corolla 18 to 20 mm. long.....

22. *R. rosei*.

Lateral nerves 2 to 4 on each side, inconspicuous.

Branches whitish; calyx 1 to 1.5 mm. long. Corolla 5 to 6 mm. long.....

23. *R. gaumeri*.

Branches brown or grayish; calyx 2 to 3 mm. long.

Calyx lobes long-ciliate; flowers clustered.

24. *R. blepharodes*.

Calyx lobes obscurely ciliate or naked; flowers solitary.

Fruit 6 to 8 mm. in diameter; seeds 2 to 4.

25. *R. obcordata*.

Fruit 16 to 25 mm. in diameter; seeds numerous.

26. *R. thurberi*.

1. *Randia echinocarpa* Moc. & Sessé; DC. Prodr. 4: 385. 1830.

Genipa echinocarpa A. Gray, Proc. Amer. Acad. 21: 380. 1886.

Chihuahua and Sonora to Guerrero and Veracruz.

Shrub or small tree, sometimes 6 meters high; spines in 4's at the ends of the branches; leaves sessile or subsessile, oval, oval-obovate, or rhombic-ovate, 3.5 to 8.5 cm. long, rounded or obtuse at apex, densely pilose beneath, at least along the veins; flowers dioecious, orange-yellow; staminate corolla appressed-pilose, the tube 3 cm. long; fruit subglobose, 4.5 to 9 cm. in diameter, green or yellow, pubescent, the tubercles 1 to 3 cm. long. "Papache," "papache picudo" (Sinaloa).

The fruit is edible and is considered (in Sinaloa) a remedy for malaria.

2. *Randia laevigata* Standl., sp. nov.

Sonora to Durango and Tepic; type from Sierra de Alamos, Sonora (*Rose, Standley & Russell* 13051; U. S. Nat. Herb. no. 635870).

Unarmed shrub, 2 meters high; leaves sessile or short-petiolate, obovate-oblong or rhombic-ovate, 14 to 23 cm. long, acute or acuminate, attenuate to base, pubescent beneath when young, glabrate in age; fruit subglobose, 6.5 cm. long, glabrous. "Crucecilla de la sierra" (Sinaloa).

In Sinaloa the fruit is employed as a remedy for bronchitis.

3. *Randia longiloba* Hemsl. Biol. Centr. Amer. Bot. 4: 101. 1886.

Yucatán; type from Cozumel Island.

Tree, 6 to 7.5 meters high; leaves petiolate, ovate to oblong-elliptic, 2 to 4.5 cm. long, acute or short-acuminate, rounded to acute at base; flowers terminal, usually clustered, subsessile; corolla white, the tube 17 to 22 mm. long. "Xcaax" (Maya).

4. *Randia armata* (Swartz) DC. Prodr. 4: 387. 1830.

Mussaenda spinosa Jacq. Stirp. Amer. 70. 1763.

Gardenia armata Swartz, Prodr. Veg. Ind. Occ. 51. 1788.

Randia spinosa Karst. Fl. Columb. 2: 128. 1869. Not *R. spinosa* Poir. 1811.

Southern Baja California and Sinaloa to Chiapas. Lesser Antilles; Central and South America; type from Cartagena, Colombia.

Shrub or small tree, 1 to 12 meters high, the trunk sometimes 70 cm. in diameter; spines in 4's at the ends of the branchlets; leaves slender-petiolate, ovate or obovate, 6 to 20 cm. long, acute or acuminate at base and apex, puberulent

or glabrate; flowers dioecious, white or yellowish white; corolla tube 2.5 cm. long; fruit oval or subglobose, 2.5 to 3.5 cm. long. "Huele de noche," "palo de la cruz," "zapotillo" (Oaxaca); "canastilla" (Chiapas); "rosetillo" (Honduras, Guatemala); "María Angola" (Colombia); "jicarillo," "cruceito," "cruetilla," "caca de mico," "torolillo" (El Salvador).

The wood is said to be useful for various purposes. The fruit is reported to have emetic properties and to be used in Martinique for stupefying fish. The flowers are sweet-scented.

5. *Randia tetracantha* (Cav.) DC. Prodr. 4: 387. 1830.

Mussaenda tetracantha Cav. Icon. Pl. 4: 20. pl. 435. 1799.

Sinaloa to Guerrero; type from Acapulco, Guerrero.

Shrub, 2 to 3 meters high; spines in 4's at the ends of the branchlets; leaves slender-petiolate, ovate or rhombic-ovate, 5 to 11 cm. long, acute or acuminate, puberulent or glabrate beneath; flowers terminal, dioecious (?), solitary or clustered; corolla tube 5 cm. long or longer; fruit oval, 2.5 to 4.5 cm. long, yellowish. "Arbol de las cruces" (Guerrero).

6. *Randia albonervia* T. S. Brandeg. Zoe 5: 257. 1908.

Veracruz; type from Corral de las Piedras, near Zacuapan.

Shrub; branchlets with 2 or 4 spines at apex; leaves petiolate, obovate or ovate, 2 to 5.5 cm. long, acute or short-acuminate, cuneate at base, appressed-pilose beneath; flowers terminal, solitary; corolla densely white-pilose, the tube 3 to 4 cm. long.

7. *Randia cinerea* (Fernald) Standl.

Genipa cinerea Fernald, Proc. Amer. Acad. 33: 93. 1897.

Guerrero and Oaxaca; type from Acapulco, Guerrero.

Sarmentose shrub; spines in 2's or 4's at the ends of the branchlets; leaves petiolate, oval, 5 to 15 cm. long, acute to rounded at apex, rounded or obtuse at base; flowers dioecious, yellowish white; corolla sericeous; fruit obovoid, 7 cm. long, pilose.

8. *Randia nelsonii* Greenm. Proc. Amer. Acad. 34: 574. 1899.

Puebla and Oaxaca; type collected between Juchitán and Chivela, Oaxaca.

Shrub; leaves short-petiolate, obovate or obovate-orbicular, obtuse to subretuse, acute at base; flowers perfect, terminal, solitary, sessile; corolla sparsely hirtellous; fruit subglobose, 2.5 to 3 cm. long, densely short-pilose.

9. *Randia purpusii* Greenm. & Thompson, Ann. Mo. Bot. Gard. 1: 410. 1915.

Type from Minas de San Rafael, San Luis Potosí.

Leaves short-petiolate, obovate or obovate-oblong, 1.5 to 5.5 cm. long, long-attenuate at base; flowers terminal, sessile; corolla sparsely pilose.

10. *Randia watsoni* Robinson, Proc. Amer. Acad. 29: 317. 1894.

Randia tomentosa S. Wats. Proc. Amer. Acad. 25: 152. 1890. Not *R. tomentosa* Wight & Arn. 1834.

Randia megacarpa T. S. Brandeg. Zoe 5: 257. 1908.

Southern Baja California to Nuevo León, Morelos, and Michoacán; Chiapas (?); type from Sierra de la Silla, near Monterrey, Nuevo León.

Shrub or tree, 3 to 5 meters high; leaves short-petiolate, oval or obovate, 2.5 to 8.5 cm. long, acute to truncate at base; flowers perfect, white, few at the ends of the branches, sessile; corolla sparsely or densely pilose; fruit globose or oval, 6 cm. long or less, short-pilose or glabrate. "Papache" (Sinaloa).

11. *Randia blepharophylla* Standl., sp. nov.

Sinaloa and Tepic; type collected between Aguacate and Dolores, Tepic (Rose 2028; U. S. Nat. Herb. no. 300921).

Unarmed shrub; leaves sessile, oval or rounded-ovate, 8 to 11 cm. long, rounded at apex, subcordate at base, densely ciliate, in age glabrate but when young copiously pilose beneath; flowers dioecious, the staminate in few-flowered axillary short-pedunculate cymes; calyx and hypanthium 4 mm. long, glabrous, the limb irregularly undulate; corolla tube glabrous, 8 mm. long, the lobes oval, 5 to 6 mm. long, ciliate; fruit subglobose, glabrous, 13 mm. in diameter or larger.

12. *Randia pringlei* A. Gray. Proc. Amer. Acad. 21: 379. 1886.

Basanacantha reticulata S. Wats. Proc. Amer. Acad. 18: 98. 1883. Not
Randia reticulata Benth. 1849.

Coahuila and Durango; type from mountains near Jimulco, Coahuila.

Shrub or small tree; leaves mostly obovate or oval, 3 to 8 cm. long, acute to rounded at apex, cuneate-attenuate to truncate and decurrent at base, densely tomentose or pubescent beneath; flowers dioecious, terminal, clustered; corolla white, the tube 10 to 12 mm. long; fruit globose, 2 cm. in diameter, densely pubescent. "Chapote" (Coahuila).

13. *Randia rhagocarpa* Standl., sp. nov.

Type from Victoria, Tamaulipas (*Palmer* 38; U. S. Nat. Herb. no. 572266).

Shrub about 4.5 meters high, the branches armed with numerous pairs of stout divaricate spines; leaves petiolate, the blades cuneate-orbicular or rounded-obovate, 1.5 to 4 cm. long, cuneate or acuminate at base, rounded or truncate at apex, ciliolate, glabrous beneath; flowers terminal, sessile; fruit globose, about 12 mm. in diameter, smooth, black, very lustrous, the pericarp thin, succulent, soft when dry; seeds about 8, 5 to 7 mm. long.

14. *Randia mitis* L. Sp. Pl. 1192. 1753.

Randia aculeata L. Sp. Pl. 1192. 1753.

Randia latifolia Lam. Encycl. 3: 24. 1789.

Mussaenda rotundifolia Sessé & Moc. Fl. Mex. ed. 2. 59. 1894.

Veracruz and Oaxaca; Sinaloa (?); Tamaulipas (?). West Indies; Panama and Colombia; type from Jamaica.

Shrub, 1 to 3 meters high; leaves sessile or short-petiolate, very variable in shape, 1 to 10 cm. long, acute to rounded at apex, glabrous beneath or sparsely pilose along the costa; flowers perfect, usually clustered, sessile; corolla white, 6 to 8 mm. long, glabrous; fruit globose, 6 to 13 mm. in diameter. "Crucilla" (Tamaulipas); "crucecilla de la costa" (Sinaloa); "crucecito" (Tamaulipas, *Escontria*; Colombia); "tintillo," "escambrón," "palo de cotorra," "cambrón" (Porto Rico); "maíz tostado" (Colombia); "agalla de costa," "yamaguey," "yamaguey de costa," "pitajoni bravo," "pitajoni espinoso" (Cuba); "espino cruz," "crucecete" (Veracruz); "papachilla" (Sinaloa).

The green fruit is astringent and in the West Indies has been employed as a remedy for dysentery. The ripe fruit is sometimes eaten, and it is reported to yield a blue dye.

15. *Randia truncata* Greenm. & Thompson, Ann. Mo. Bot. Gard. 1: 411. 1915.

Randia tetramera Loesener, Verh. Bot. Ver. Brand. 56: 109. 1923.

Yucatán; type from Izamal.

Shrub, 2 to 4 meters high, the spines in pairs at the ends of the branches; leaves nearly sessile, suborbicular or obovate, 1 to 3 cm. long, obtuse or rounded at apex, glabrous; flowers perfect; corolla glabrous, the tube 1 to 1.5 cm. long. "Mehenkax," "kax" (Maya).

This is perhaps the plant reported from Yucatán as *R. aculeata* L., which is said to bear the Maya name "xpech citam."

16. *Randia malacocarpa* Standl., sp. nov.

Sinaloa and Tepic; type from Acaponeta, Tepic (*Rose* 3298; U. S. Nat. Herb. no. 302274).

Shrub, about 1 meter high, the branches armed at the apex with two stout spines; leaves mostly clustered on short lateral spurs, short-petioled, the blades mostly ovate, ovate-oblong, or narrowly elliptic-oblong, rarely rounded-obovate, 2.5 to 5.5 cm. long, acute to long-attenuate at base, usually acute at apex, puberulent or scaberulous above, densely short-pilose beneath; flowers perfect, terminal, sessile; calyx densely short-pilose, the hypanthium 2 mm. long, the calyx lobes linear or oblong, 1 to 1.5 mm. long; corolla salverform, sparsely hirtellous outside, the tube 3 to 4 mm. long, the 5 lobes rounded, 2 to 3 mm. long, the throat naked; fruit globose, 12 mm. in diameter or larger, densely velvety-pilose, the pericarp very thick and hard; seeds numerous.

17. *Randia induta* Standl., sp. nov.

Type from Cayacol, Guerrero (*Nelson* 7018; U. S. Nat. Herb. no. 399362).

Branchlets armed at apex with two stout spines 7 to 13 mm. long; leaves slender-petiolate, the blades oblong-obovate or rhombic-obovate, 5 to 9 cm. long, 2.5 to 4.5 cm. wide, acute or acuminate at base, rounded or very obtuse at apex, glabrous above, beneath copiously puberulent; fruits terminal on short lateral spurs, solitary, sessile, globose, 7 to 10 mm. in diameter, smooth, glabrate, the pericarp very thin; seeds usually 4, about 5 mm. long.

18. *Randia xalapensis* Mart. & Gal. Bull. Acad. Brux. 11¹: 239. 1844.

?*Randia tomatillo* Loesener, Repert. Sp. Nov. Fedde 18: 360. 1922.

Tamaulipas, Veracruz, and Yucatán; type from Jalapa, Veracruz.

Shrub or small tree; leaves sessile or subsessile, obovate to elliptic-oblong, 1.5 to 4 cm. long, acute to rounded at apex, coriaceous; flowers perfect, white; corolla glabrous; fruit 2 to 2.5 cm. long, white, the pulp black. "Nanche" (Tamaulipas); "tomatillo" (Veracruz).

19. *Randia chiapensis* Standl., sp. nov.

Type from Canjob, Chiapas (*Goldman* 797; U. S. Nat. Herb. no. 470602).

Branchlets bearing at apex two slender or stout spines 7 to 12 mm. long; leaves mostly clustered on very short lateral spurs, the petioles 2 mm. long or less, the blades obovate to rhombic-orbicular, 1 to 3 cm. long, 6 to 15 mm. wide, at base attenuate or rounded and short-decurrent, rounded or very obtuse at apex, glabrous; flowers perfect, terminal, solitary, sessile, 5-parted; calyx and hypanthium glabrous, the calyx lobes linear to ovate-oblong, obtuse, shorter than the hypanthium; corolla 6 to 7 mm. long, glabrous outside, the tube nearly as thick as long, the throat naked, the lobes suborbicular, shortly cuspidate-acuminate, about equaling the tube.

20. *Randia laetevirens* Standl., sp. nov.

?*Randia latifolia micrantha* Schlecht. Linnæa 6: 723. 1831.

Sinaloa and Tepic; Tamaulipas, Nuevo León, and Veracruz; type from Cerro de la Silla near Monterrey, Nuevo León (*Nelson* 6683; U. S. Nat. Herb. no. 347312).

Shrub 1 to 3 meters high, the branchlets bearing at the apex two stout ascending spines; leaves crowded on very short lateral spurs, petiolate or subsessile, the blades mostly obovate-oblong, 1 to 6 cm. long, 0.5 to 2 cm. wide, acute to attenuate at base, acute to rounded at apex, glabrous; flowers perfect, terminal, sessile, usually clustered, 5-parted; calyx and hypanthium glabrous or obscurely scaberulous, the calyx lobes triangular-subulate, half as long as the tube or almost obsolete; corolla glabrous outside, the tube 4 to 6.5 mm. long, the throat naked, the lobes rounded-ovate, 2.5 to 4.5 mm. long, abruptly short-acuminate; fruit globose, 8 to 14 mm. in diameter, smooth or slightly rugose, glabrous, the pericarp thick and hard; seeds 5 to 7, 6 to 7 mm. long. "Capulín corona" (San Luis Potosí); "crucero blanco," "crucero" (Tamaulipas).

A decoction of the wood is used in San Luis Potosí for affections of the chest.

21. *Randia canescens* Greenm. Proc. Amer. Acad. 34: 573. 1899.

Morelos; type from Cuernavaca.

Shrub or small tree, 3 to 5 meters high; leaves sessile or short-petiolate, 7 to 15 mm. long, rounded at apex, rounded to acute at base; flowers perfect, sessile; corolla short-pilose, the tube 6 to 7 mm. long.

22. *Randia rosei* Standl., sp. nov.

Sinaloa and Tepic; type from Rosario, Sinaloa (*Rose* 1551; U. S. Nat. Herb. no. 300395).

Branches armed with numerous pairs of stout divergent spines 1 to 2 cm. long; leaves mostly crowded on short lateral spurs, slender-petiolate, the blades suborbicular to rhombic-ovate, 1 to 2.5 cm. long, rounded or obtuse at base, rounded or very obtuse at apex, short-pilose beneath along the veins, elsewhere glabrous; flowers perfect, terminal, solitary, sessile; hypanthium 2 mm. long, pilose, the calyx lobes linear, 3 to 6 mm. long, ciliate; corolla salverform, glabrous outside, the tube 10 to 12 mm. long, the throat naked, the 5 lobes ovate-oval, 8 mm. long, obtuse or acutish; fruit subglobose, rather sparsely pilose.

23. *Randia gaumeri* Greenm. & Thompson, Ann. Mo. Bot. Gard. 1: 410. 1915.

Yucatán; type from Izamal.

Shrub; leaves short-petiolate, cuneate-orbicular or obovate, 5 to 15 mm. long, broadly rounded at apex, glabrous or nearly so; flowers perfect; corolla glabrous.

24. *Randia blepharodes* Standl., sp. nov.

Guerrero and Oaxaca; type from Mexcala, Guerrero, altitude 500 meters (*Langlassé* 1033; U. S. Nat. Herb. no. 386343).

Shrub about 3 meters high, the branches bearing numerous pairs of stout divaricate spines 1 to 2 cm. long; leaves crowded on short lateral spurs, subsessile or short-petiolate, the blades cuneate-orbicular or rounded-obovate, 7 to 17 mm. long and broad, cuneate at base, broadly rounded at apex or subretuse, glabrous; flowers perfect, terminal, clustered, sessile, 5-parted; calyx and hypanthium more or less scaberulous, the calyx lobes lance-linear, much longer than the tube, long-ciliate; corolla white, glabrous outside, the tube slender, 1 cm. long, the throat naked, the lobes ovate or oblong-ovate, 4 to 5 mm. long; fruit globose, about 2 cm. in diameter, sparsely puberulent, the pericarp hard and thick; seeds numerous.

25. *Randia obcordata* S. Wats. Proc. Amer. Acad. 24: 53. 1889.

Sonora to Colima; type from Guaymas, Sonora.

Shrub, 2 to 3 meters high; leaves flabellate or obcordate, 4 to 18 mm. long, truncate or retuse at apex, decurrent to a short petiole, glabrous; fruit black. "Papachillo" (Sinaloa).

26. *Randia thurberi* S. Wats. Proc. Amer. Acad. 24: 53. 1889.

Sonora and Sinaloa; type collected between Rayón and Ures, Sonora.

Shrub 1.5 to 2.5 meters high; leaves petiolate, orbicular to cuneate-obovate, 0.6 to 4.5 cm. long, obtuse to subretuse at apex, cuneate to abruptly long-attenuate at base, glabrous or nearly so; flowers perfect, sessile; fruit greenish yellow, glabrous. "Papache" (Sonora, Sinaloa).

The fruit is edible. Birds are fond of it, and one seldom sees a fruit from which the birds have not extracted the pulpy interior, which has the appearance of blackberry jam.

DOUBTFUL SPECIES.

RANDIA CAPITATA DC. Prodr. 4: 387. 1830. Type from "Anasteca."

25. *OTOCALYX* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 68. 1914.

A single species is known.

1. *Otocalyx chiapensis* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 69. 1914
Type from Cerro del Boquerón, Chiapas.

Shrub; leaves slender-petiolate, ovate, 4 to 6 cm. long, long-acuminate, rounded or obtuse at base, appressed-pilose beneath along the veins; flowers in axillary or terminal, few-flowered, long-pedunculate cymes; calyx 4-lobate, one of the lobes dilated into a foliaceous limb 9 to 12 mm. long; corolla sericeous, the tube 1 cm. long, the 4 lobes 5 to 6 mm. long; fruit baccate (?), subglobose, 5 to 6 mm. long; seeds minute, angulate.

26. **HAMELIA** Jacq. Enum. Pl. Carib. 2, 16. 1760.

Shrubs or small trees; leaves opposite or verticillate, petiolate; flowers yellow or red, in chiefly terminal scorpioid cymes; calyx 5-lobate or 5-dentate; corolla tubular or funnellform, the tube 5-costate, the lobes short, imbricate; fruit small, baccate, 5-celled; seeds numerous, minute, angulate.

Calyx lobes oblong to subulate, longer than broad.

Calyx lobes subulate; corolla 3.5 to 4 cm. long.----- 1. **H. xorullensis**.

Calyx lobes mostly oblong, obtuse; corolla 1.8 to 2.3 cm. long.

Corolla villous outside; leaves villous beneath----- 2. **H. rovirosae**.

Corolla glabrous or minutely puberulent; leaves puberulent beneath along the veins.----- 3. **H. calycosa**.

Calyx lobes deltoid, as broad as long.

Flowers not secund or obscurely so, pedicellate; fruit globose; corolla 8 to 13 mm. long.----- 4. **H. versicolor**.

Flowers secund, mostly sessile; fruit usually longer than broad; corolla 14 to 22 mm. long.

Mature leaves glabrous, or pubescent beneath along the costa and lateral nerves; leaves mostly quaternate----- 5. **H. nodosa**.

Mature leaves copiously pubescent beneath, usually over the whole surface; leaves mostly ternate----- 6. **H. erecta**.

1. *Hamelia xorullensis* H. B. K. Nov. Gen. & Sp. 3: 414. 1818.

Hamelia hypomalaca Robinson, Proc. Amer. Acad. 45: 406. 1910.

Sinaloa and Durango to Michoacán; type from Volcán de Jorullo, Michoacán, altitude 1,150 meters.

Shrub, about 3 meters high; leaves mostly ternate, oval to elliptic, 6 to 13 cm. long, acuminate, rounded or obtuse at base, densely short-pilose or villosulous beneath; corolla yellow, 3.5 to 4 cm. long, the throat 1 cm. broad or more. "Aguacatillo" (Michoacán).

2. *Hamelia rovirosae* Wernham, Journ. Bot. Brit. & For. 49: 211. 1911.

Hamelia patens coronata Donn. Smith, Bot. Gaz. 40: 4. 1905.

Type from Río San Sebastián, Tabasco. Central America.

Large shrub, sometimes scandent, the branches villous; leaves ternate, elliptic or elliptic-oblong, 5 to 11 cm. long, short-acuminate, acute at base; corolla red, 18 to 24 mm. long.

3. *Hamelia calycosa* Donn. Smith, Bot. Gaz. 12: 132. 1887.

Hamelia chiapensis T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 71. 1914.

Chiapas. Guatemala; type from Pansamalá.

Shrub, about 4 meters high; leaves mostly ternate, elliptic or oblong-elliptic, 6 to 8.5 cm. long, acuminate, acute at base; corolla yellow, 18 to 22 mm. long.

4. *Hamelia versicolor* A. Gray; S. Wats. Proc. Amer. Acad. 21: 416. 1886.

Sinaloa to Oaxaca; type from barranca near Guadalajara, Jalisco.

Shrub, 1.5 to 3 meters high; leaves mostly ternate, ovate to elliptic-oblong, 3 to 12.5 cm. long, acute or acuminate, rounded to acute at base, puberulent or villosulous beneath; corolla orange, becoming red in age; fruit red, 5 to 7 mm. long. "Sangre de toro," "coralillo" (Sinaloa).

The fruit gives a lilac dye.

5. *Hamelia nodosa* Mart. & Gal. Bull. Acad. Brux. 11¹: 234. 1844.

Veracruz and Oaxaca; type from Mirador, Veracruz, altitude 900 meters. Costa Rica.

Shrub, 2.5 to 3 meters high; leaves ovate to elliptic-oblong, 4 to 9.5 cm. long, acute or short-acuminate, rounded to attenuate at base; corolla red, 18 to 22 mm. long; fruit 8 to 10 mm. long.

6. *Hamelia erecta* Jacq. (Enum. Pl. Carib. 16, hyponym. 1760) Stirp. Amer. 71. 1763.

Hamelia patens Jacq. (Enum. Pl. Carib. 16, hyponym, 1760) Stirp. Amer. 72. 1763.

Hamelia lanuginosa Mart. & Gal. Bull. Acad. Brux. 11¹: 233. 1844.

Tamaulipas, Veracruz, Oaxaca, Chiapas, and Yucatán. Southern Florida; West Indies; Central and South America; type from Cartagena, Colombia.

Shrub or small tree, 1 to 4 meters high; leaves lance-oblong to ovate or oval, 6 to 20 cm. long, usually short-acuminate, rounded to acuminate at base; corolla red, puberulent or villosulous; fruit 6 to 10 mm. long, red. "Kanan," "xkaná," "xkanan" (Yucatán, Maya); "chacloco" (Tamaulipas); "chichipín" (Guatemala, Honduras); "readito" (Colombia); "zorrillo real," "palo camarón" (Costa Rica); "sisipinse," "flor de cangrejo" (Guatemala); "coralillo," "chichipinee," "xuehit paltimatía," "flor de baño" (El Salvador); "canilla de venado" (Nicaragua); "ponasí," "bonasí," "palo de coral" (Cuba); "bálsamo" (Porto Rico); "cacanapazue," "pañete" (Veracruz); "coral" (Honduras); "uvero" (Panama); "zorrillo" (Costa Rica).

The fruit is acid and edible, and a fermented drink is said to have been prepared from it. The leaves and stems have been used for tanning. The crushed leaves are sometimes applied to cuts and bruises, and a sirup prepared from the fruit has been employed in the West Indies as a remedy for dysentery.

DOUBTFUL SPECIES.

HAMELIA ROSTRATA Bartl.; DC. Prodr. 4: 442. 1830. Type from Acapulco, Guerrero. Probably identical with *H. versicolor*.

27. *HOFFMANNIA* Swartz, Prodr. Veg. Ind. Occ. 30. 1788.

Shrubs or rarely herbs; leaves opposite or verticillate; flowers small, cymose, axillary, the cymes sessile or pedunculate; calyx usually 4-lobate, the lobes short, persistent; corolla funnellform or nearly rotate, the lobes imbricate; fruit baccate, small, 2-celled; seeds numerous, minute.

Lobes of the corolla twice as long as the tube or longer.

Calyx truncate.....1. *H. lenticellata*.

Calyx lobate.

Cymes long-pedunculate, longer than the petioles, the peduncles equaling or longer than the cymes.

Corolla red.

Leaves glabrous beneath; corolla 12 to 13 mm. long....2. *H. discolor*.

Leaves villous or villosulous beneath along the veins; corolla 10 mm. long.....3. *H. refulgens*.

Corolla yellow.....4. *H. rosei*.

Cymes sessile or short-pedunculate, usually shorter than the petioles, the peduncles shorter than the cymes.

Leaves oval-elliptic, 6 to 7.5 cm. wide.....5. *H. rotundata*.

Leaves obovate or elliptic-oblong, 1 to 3 cm. wide.....6. *H. mexicana*.

Lobes of the corolla equaling or shorter than the tube, or but slightly exceeding it.

Corolla pubescent outside.

Cymes long-pedunculate.....7. *H. orizabensis*.

Cymes sessile or nearly so.....8. *H. cuneatissima*.

Corolla glabrous.

Leaves villosulous beneath, at least along the costa, mostly elliptic.

9. *H. chiapensis*.

Leaves glabrous or strigillose beneath, obovate-oblong or ovate-oblong.

Calyx lobes deltoid, minute; leaves caudate-acuminate. 10. *H. konzattii*.

Calyx lobes oblong, 1 mm. long; leaves attenuate at apex.

11. *H. strigillosa*.

1. *Hoffmannia lenticellata* Hemsl. *Diag. Pl. Mex.* 30. 1879.

Veracruz, the type from Orizaba. Guatemala.

Glabrous shrub; leaves petiolate, obovate or elliptic, 10 to 22 cm. long, obtusely acuminate; flowers 6 mm. long.

2. *Hoffmannia discolor* (Lemaire) Hemsl. *Biol. Centr. Amer. Bot.* 2: 36. 1881
Campylobotrys discolor Lemaire, *Fl. Serr. Jard.* 3: Misc. 37. 1847.

Described from cultivated plants which were believed to be of Mexican origin; reported from Chiapas.

Plants herbaceous or suffrutescent; leaves petiolate, obovate, 14 cm. long, obtuse or acutish, acute at base.

3. *Hoffmannia refulgens* (Hook.) Hemsl. *Biol. Centr. Amer. Bot.* 2: 37. 1881.
Higginsia refulgens Hook. in *Curtis's Bot. Mag. pl.* 5346. 1862.

Chiapas. Central America.

Plants suffrutescent; leaves short-petiolate, obovate, 9 to 25 cm. long, rounded or obtuse at apex, acute at base; peduncles 2.5 to 12 cm. long.

4. *Hoffmannia rosei* Robinson, *Proc. Amer. Acad.* 45: 407. 1910.

Type from Pedro Paulo, Tepic.

Shrub, 3 meters high; leaves petiolate, obovate or elliptic-oblong, 6 to 12 cm. long, acuminate, minutely puberulent beneath; corolla white, 7 mm. long.

5. *Hoffmannia rotundata* Standl. *Contr. U. S. Nat. Herb.* 20: 204. 1919.

Type from Cerro del Boquerón, Chiapas.

Leaves petiolate, obtuse to acute and short-acuminate, ferruginous-villous beneath, especially along the veins; corolla 6 to 8 mm. long.

6. *Hoffmannia mexicana* (Link, Klotzsch & Otto) Hemsl. *Biol. Centr. Amer. Bot.* 2: 37. 1881.

Higginsia mexicana Link, Klotzsch & Otto, *Icon. Pl. Rar. Hort. Berol.* 1: 57. *pl.* 23. 1841.

Veracruz; Chiapas (?); described from cultivated plants.

Slender shrub, 0.6 to 1.2 meters high; leaves slender-petiolate, 2 to 9.5 cm. long, acute or acuminate, puberulent or villosulous beneath along the veins; corolla yellow, 7 mm. long; fruit red, 5 to 9 mm. long.

7. *Hoffmannia orizabensis* Standl. *Contr. U. S. Nat. Herb.* 20: 205. 1919.

Type from the region of Orizaba, Veracruz.

Low shrub; leaves slender-petiolate, elliptic or elliptic-oblong, 3 to 8 cm. long, acute, rufous-villosulous beneath along the veins; cymes about 4-flowered; corolla 12 to 13 mm. long.

8. *Hoffmannia cuneatissima* Robinson, *Proc. Amer. Acad.* 45: 407. 1910.

Morelos; type from Cuernavaca, altitude 1,950 meters.

Shrub; leaves slender-petiolate, oblanceolate or obovate, 6 to 16 cm. long, short-acuminate, puberulent beneath along the veins; cymes 4 to 8 flowered; corolla yellowish, 1 cm. long; fruit 5 mm. in diameter.

9. *Hoffmannia chiapensis* Standl. *Contr. U. S. Nat. Herb.* 20: 206. 1919.

Type from Cerro del Boquerón, Chiapas.

Leaves slender-petiolate, 10 to 19 cm. long, acuminate; cymes few or many-flowered; corolla yellow, 10 to 12 mm. long.

10. *Hoffmannia konzattii* Robinson, Proc. Amer. Acad. 45: 406. 1910.

Type from Colonia Melchor Ocampo, Veraacruz, altitude 1,200 meters.

Glabrous shrub; leaves petiolate, 11 to 16 cm. long, long-attenuate at base, paler beneath; cymes about 6-flowered; corolla 6 mm. long.

11. *Hoffmannia strigillosa* Hemsl. Diag. Pl. Mex. 31. 1879.

Described from Mexico, the locality not known.

Shrub; leaves short-petiolate, 15 to 20 cm. long, long-attenuate at base; cymes few-flowered.

28. *MACHAONIA* Humb. & Bonpl. Pl. Aequin. 1: 701. 1808.

Shrubs or small trees; flowers small, white or whitish, the inflorescence terminal; calyx tube compressed, the limb 4 or 5-lobate, the lobes persistent; corolla short-funnelform, the throat villous, the 4 or 5 lobes rounded, imbricate; fruit oblong or obpyramidal, compressed, dioecious, the cells indehiscant, 1-seeded.

Leaves oblong-linear or linear-oblanccolate, less than 4 mm. wide, mostly fasciculate.....1. *M. coulteri*.

Leaves broader than oblong-linear, 5 to 35 mm. broad, opposite or ternate.

Leaves copiously short-pilose or puberulent beneath.

Calyx lobes longer than broad, acute or acutish.....2. *M. velutina*.

Calyx lobes as broad as long, rounded.....3. *M. acuminata*.

Leaves glabrous beneath or nearly so.

Calyx lobes glabrous, not ciliolate, usually truncate; leaves linear-lanceolate.

4. *M. pringlei*.

Calyx lobes puberulent or ciliolate, not truncate; leaves mostly ovate or elliptic.

Tube of the calyx densely covered with minute whitish appressed hairs, the lobes ovate, as long as the corolla tube.....5. *M. floribunda*.

Tube of the calyx sparsely pilose with short spreading hairs or glabrate, the lobes obovate, shorter than the corolla tube...6. *M. lindeniana*.

1. *Machaonia coulteri* (Hook. f.) Standl. Contr. U. S. Nat. Herb. 20: 209. 1919.

Microsplenium coulteri Hook. f. in Benth. & Hook. Gen. Pl. 2: 4. 1873.

Machaonia fasciculata A. Gray, Proc. Amer. Acad. 19: 77. 1883.

Querétaro and Hidalgo; type from Zimapán, Hidalgo.

Unarmed shrub; leaves subsessile, 5 to 16 mm. long, rounded or obtuse at apex, sparsely short-pilose or glabrous; inflorescence few or many-flowered, 1 to 2.5 cm. broad; calyx lobes orbicular; corolla yellowish, 4 to 5 mm. long. "Huele de noche del campo" (Querétaro).

2. *Machaonia velutina* Mart. & Gal. Bull. Acad. Brux. 11¹: 134. 1844.

Machaonia veracruzeana Baill. Bull. Soc. Linn. Paris. 1: 204. 1879.

Machaonia hahniana Baill. Bull. Soc. Linn. Paris. 1: 204. 1879.

Veraacruz; type from Puente Nacional.

Shrub, usually unarmed; leaves petiolate, broadly ovate to oblong-ovate, 2.5 to 3.5 cm. long, acute or short-acuminate; cymes 2.5 to 5 cm. broad; corolla ochroleucous; fruit 4 to 5 mm. long.

3. *Machaonia acuminata* Humb. & Bonpl. Pl. Aequin. 1: 101. 1808.

Veraacruz and Tabasco. Panama and South America; type from Ecuador.

Shrub or tree, sometimes 10 meters high; leaves short-petiolate, ovate or ovate-elliptic, 5 to 10 cm. long, acute or short-acuminate, tomentulose or short-pilose beneath; inflorescence much branched, 6 to 10 cm. broad; corolla 4 to 5 mm. long; fruit 5 mm. long.

4. *Machaonia pringlei* A. Gray, Proc. Amer. Acad. **21**: 380. 1886.

Type from mountains near Jimulco, Coahuila.

Shrub, 1 to 2 meters high; leaves short-petiolate, 3 to 6 cm. long, long-attenuate at each end, glabrous; cymes 3 to 6.5 cm. broad; corolla 4 mm. long.

5. *Machaonia floribunda* Greenm. Proc. Amer. Acad. **33**: 488. 1898.

Type collected near Tampico, Tamaulipas.

Shrub or small tree, 3 to 4.5 meters high; leaves short-petiolate, 3 to 5 cm. long, acute or acuminate, glabrous beneath or sparsely puberulent along the costa; inflorescence much branched, 5 to 7 cm. wide; corolla white, 2 mm. long.

6. *Machaonia lindeniana* Baill. Bull. Soc. Linn. Paris **1**: 204. 1879.

Campeche and Yucatán; type from Campeche.

Shrub or tree, 4 to 9 meters high; leaves short-petiolate, 2 to 4 cm. long, obtuse to short-acuminate, short-barbate beneath in the axils of the nerves, elsewhere glabrous; inflorescence 4 to 7 cm. broad; corolla ochroleucous, 3 mm. long; fruit 2 to 2.5 mm. long.

DOUBTFUL SPECIES.

MACHAONIA GALEOTTIANA Baill. Bull. Soc. Linn. Paris **1**: 204. 1879. Type from Veraacruz.

29. *CHOMELIA* Jacq. Enum. Pl. Carib. **1**. 1760.

Shrubs, often armed with spines; flowers small, white or yellow, usually in axillary pedunculate cymes; calyx limb 4-lobate, the lobes persistent; corolla salverform or funnellform, the tube slender, elongate, the 4 lobes valvate or subimbriate; fruit drupaceous, osseous, 2-celled, the cells 1-seeded.

Corolla lobes long, attenuate; plants usually armed with spines... **1. *C. spinosa*.**

Corolla lobes short, obtuse; plants unarmed.

Corolla tube 15 mm. long..... **2. *C. barbata*.**

Corolla tube 10 mm. long or less.

Calyx lobes oblong or linear, 1 to 1.5 mm. long; leaves pubescent beneath with spreading hairs..... **3. *C. pringlei*.**

Calyx lobes minute, as broad as long; leaves sericeous beneath, at least along the veins..... **4. *C. protracta*.**

1. *Chomelia spinosa* Jacq. Stirp. Amer. **18**. 1760.

Guettarda armata Bartl.; DC. Prodr. **4**: 457. 1830.

Chomelia filipes Benth.; Oerst. Nat. For. Kjöbenhavn Vid. Medd. **41**. 1852.

Anisomeris purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 70. 1914.

Oaxaca and Chiapas. Central America and Colombia; type from Cartagena, Colombia.

Shrub, armed at the axils with long stout spines; leaves petiolate, rounded-ovate to oblong-ovate, 4 to 8 cm. long, rounded to short-acuminate at apex, pilose beneath, especially along the veins; cymes few-flowered; calyx lobes lanceolate; corolla sericeous, the tube 12 to 22 mm. long; fruit 9 to 12 mm. long.

2. *Chomelia barbata* Standl. Journ. Washington Acad. Sci. **13**: 7. 1923.

Type from Chacahua, Distrito de Juquila, Oaxaca.

Leaves slender-petiolate, the blades elliptic, 3.5 to 5.5 cm. long, obtuse or acutish, rounded to acute at base, densely barbate beneath along the costa; cymes few-flowered, on very slender peduncles; calyx lobes minute; corolla appressed-pilosulous; fruit white, 2-celled, oblong, 1 to 1.5 cm. long.

3. *Chomelia pringlei* S. Wats. Proc. Amer. Acad. **26**: 137. 1891.

Type from Tamasopo Canyon, San Luis Potosí.

Shrub or small tree, 4.5 meters high; leaves short-petiolate, elliptic or oval, 4.5 to 7.5 cm. long, acute or short-acuminate; cymes 3 to 6-flowered; corolla 8 to 9 mm. long, short-pilose; fruit 5 to 6 mm. long.

4. *Chomelia protracta* (Bartl.) Standl.

Guettarda protracta Bartl.; DC. Prodr. 4: 457. 1830.

Antirrhoea protracta Hemsl. Biol. Centr. Amer. Bot. 2: 42. 1881.

Guerrero to Oaxaca. Guatemala and Honduras.

Shrub; leaves short-petiolate, oblong-lanceolate or oblong-elliptic, 7 to 15 cm. long, long-acuminate, acute at base; cymes few or many-flowered; corolla sericeous, the tube 7 to 10 mm. long; fruit oval, 4 to 5 mm. long.

30. *GUETTARDA* L. Sp. Pl. 991. 1753.

Shrubs or trees; flowers small, perfect, in axillary, bifurcate or congested cymes, sometimes solitary, usually secund; calyx truncate or dentate; corolla funnellform or salverform, the tube elongate, the lobes obtuse, imbricate; fruit drupaceous, the flesh very thin, the stone hard, 4 to 9-celled, the cells 1-seeded.

Leaves cordate or subcordata at base, mostly 10 to 14 cm. wide. 1. *G. seleriana*.

Leaves acute to rounded at base, less than 10 cm. wide.

Pubescence of the lower surface of the leaves of spreading hairs. . . 2. *G. filipes*.

Pubescence of the lower surface of the leaves of appressed hairs.

Leaves loosely tomentose on the upper surface when young. 3. *G. galeottii*.

Leaves glabrous or nearly so on the upper surface.

Stipules obtuse; corolla 6 to 8 mm. long. 4. *G. dichotoma*.

Stipules acuminate; corolla 9 to 12 mm. long. 5. *G. elliptica*.

1. *Guettarda seleriana* (Loesener) Standl.

Guettarda scabra seleriana Loesener, Repert. Sp. Nov. Fedde 18: 361. 1922.

Type from Chichen Itzá, Yucatán.

Shrub; leaves short-petiolate, rounded or rounded-elliptic, 12 to 16 cm. long, obtuse or acutish, green and glabrate above, beneath paler, in age hirtellous-puberulent, when young sericeous-strigose; cymes many-flowered, on elongate peduncles; corolla tube about 2 cm. long, densely retrorse-sericeous.

2. *Guettarda filipes* Standl. Contr. U. S. Nat. Herb. 20: 210. 1919.

Sinaloa and Durango; type from Huasemote, Durango.

Shrub, 2 to 2.5 meters high; leaves short-petiolate, ovate to elliptic-oblong, 3 to 5.5 cm. long, obtuse or short-acuminate; cymes few-flowered, on long slender peduncles; corolla sericeous, the tube 6 to 7 mm. long. "Negrito" (Sinaloa).

3. *Guettarda galeottii* Standl., sp. nov.

Type from Pinotepa, Oaxaca (*Galeotti* 2576; U. S. Nat. Herb. no. 572993).

Branchlets densely pilose-sericeous; stipules triangular-lanceolate, 5 to 7 mm. long, attenuate-acuminate; leaves opposite, the petioles 2 to 4 mm. long, the blades ovate or oval-ovate, 3 to 5 cm. long, 1.7 to 2.7 cm. wide, rounded at base, acutely acuminate at apex, loosely and thinly tomentose above when young, becoming glabrate, paler beneath, appressed-pilose, especially along the nerves; cymes dense, many-flowered, the peduncles 1 to 1.5 cm. long, densely pilose, the flowers sessile, the bractlets minute; hypanthium densely pilose, the calyx very sparsely short-pilose, 0.5 mm. long, truncate or obscurely lobate; corolla sericeous outside, the tube slender, 7 mm. long, the 4 lobes rounded, about 1 mm. long.

4. *Guettarda dichotoma* Mart. & Gal. Bull. Acad. Brux. 11: 233. 1844.

Type from Consoquitla, Veracruz.

Leaves short-petiolate, ovate, 5 cm. long, acutish, glabrous above; corolla sericeous.

5. *Guettarda elliptica* Swartz, Prodr. Veg. Ind. Occ. 59. 1788.

?*Guettarda tetrandra* Sessé & Moc. Fl. Mex. ed. 2. 218. 1894.

Guettarda insularis T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 416. 1924.

Sinaloa to Colima; Socorro Island; Yucatán. Southern Florida; West Indies; type from Jamaica.

Shrub or tree, sometimes 8 meters high; leaves petiolate, usually oval, 1 to 7 cm. long, usually rounded or obtuse and apiculate at apex, truncate to acute at base, appressed-pilose or glabrate above; cymes 1 to 9-flowered; corolla white, sericeous; fruit subglobose, purplish, 4 to 8 mm. in diameter, 2 to 4-celled.

DOUBTFUL SPECIES.

GUETTARDA DEALBATA Mart. & Gal. Bull. Acad. Brux. 11¹: 232. 1844. Type from Oaxaca. Scarcely of this genus.

Hemsley reports *G. odorata* Lam., *G. parviflora* Vahl, and *G. scabra* Lam. from Mexico, but the writer has seen no Mexican specimens of these species. The specimens reported as *G. parviflora* are probably *G. elliptica*.

31. ERITHALIS P. Br.; L. Syst. Nat. ed. 10., 930. 1759.

1. *Erithalis fruticosa* L. Syst. Nat. ed. 10. 930. 1759.

Yucatán. Southern Florida; West Indies and Central America.

Shrub or small tree, 5 meters high or less; leaves petiolate, orbicular to oblong-ovate, 2 to 10 cm. long, rounded or obtuse at apex, acute to rounded at base, coriaceous, glabrous; flowers white, in axillary, usually many-flowered, pedunculate cymes; calyx obscurely denticulate; corolla 4 to 10 mm. long, glabrous, the lobes oblong-linear, obtuse; fruit drupaceous, globose, 2.5 to 4 mm. in diameter, black, composed of 5 to 10 carpels.

32. CHIOCOCCA P. Br.; L. Syst. Nat. ed. 10. 917. 1759.

Shrubs or small trees, often scandent or sarmentose; flowers small, usually white, in axillary, simple or paniculate, usually secund racemes; calyx 5-lobate, persistent; corolla funnellform, the 5 lobes spreading or reflexed, valvate; fruit small, drupaceous, compressed, orbicular, composed of 2 1-seeded carpels.

Anthers nearly or quite equaling the corolla lobes, sometimes longer, the filaments exerted.....1. *C. phaenostemon*.

Anthers only slightly exceeding the corolla tube or included, the filaments wholly included.

Leaves pubescent.....2. *C. pubescens*.

Leaves glabrous.

Limb of the corolla 8 to 10 mm. wide; calyx lobes semiorbicular or nearly obsolete; leaves mostly 3.5 to 6 cm. wide; fruit only slightly compressed.....3. *C. pachyphylla*.

Limb of the corolla 3 to 6 mm. wide; calyx lobes usually acute; leaves mostly narrower; fruit strongly compressed.....4. *C. alba*.

1. *Chiococca phaenostemon* Schlecht. Linnaea 9: 594. 1834.

Chiococca staminea Mart. & Gal. Bull. Acad. Brux. 11²: 231. 1844.

Veraacruz, Puebla, and Chiapas; type from Jalapa, Veraacruz.

Large shrub; leaves short-petiolate, mostly ovate-oblong or lance-oblong, 4 to 10.5 cm. long, acuminate, coriaceous, glabrous; racemes usually paniculate; corolla 5 to 8 mm. long; fruit compressed, 5 to 7 mm. long. "Jazmín de novia" (Veraacruz).

2. *Chiococca pubescens* Standl. Contr. U. S. Nat. Herb. 20: 209. 1919.

Tamaulipas, Puebla, and Oaxaca; type from San Luis Tultitlanapa, Puebla.

Leaves short-petiolate, ovate to lance-oblong, 3 to 6 cm. long, short-acuminate; racemes few-flowered; corolla 5 to 6 mm. long; fruit pubescent.

3. *Chiococca pachyphylla* Wernham, Journ. Bot. Brit. & For. 51: 323. 1913.

Nuevo León to Veracruz; type collected between Acatlán and Chiconquiaco, Veracruz.

Shrub or tree, glabrous except in the inflorescence; leaves petiolate, elliptic-oblong to ovate, 7 to 14 cm. long, short-acuminate, coriaceous; racemes paniculate; corolla 7 to 8 mm. long, reddish outside; fruit 6 to 7 mm. in diameter.

4. *Chiococca alba* (L.) Hitchc. Rep. Mo. Bot. Gard. 4: 94. 1893.

Lonicera alba L. Sp. Pl. 175. 1753.

Chiococca racemosa L. Syst. Nat. ed. 10. 917. 1759.

Chiococca macrocarpa Mart. & Gal. Bull. Acad. Brux. 11¹: 230. 1844.

Chiococca coriacea Mart. & Gal. Bull. Acad. Brux. 11¹: 231. 1844.

Baja California and Sonora to Tamaulipas, Veracruz, Yucatán, and Chiapas. Florida; West Indies; Central and South America; type from Jamaica.

Shrub, sometimes scandent; leaves petiolate, lanceolate to oval, 2.5 to 9 cm. long, usually short-acuminate; racemes simple or paniculate; corolla 6 to 8 mm. long, white or yellowish white; fruit white, 4 to 8 mm. long. "Suelda con suelda," "oreja de ratón" (*Lumholtz*); "xcanchac-ché" (Yucatán, Maya); "cainca" (*Herrera*; Colombia); "canica," "caninana" (*Ramirez*); "perlilla" (*Sessé & Mocino*); "madreselva" (Nicaragua); "bejuco de berac" (Porto Rico); "bejuco de berraco" (Cuba); "lágrimas de San Pedro," "accitillo" (El Salvador); "lágrimas de María" (Panama).

The plant was formerly used in Brazil as a remedy for dropsy and has been so used in Europe. It is reported to have diuretic, acrid, tonic, astringent, vomitive, and pectoral properties, and has been employed for venereal diseases, rheumatism, and other affections. The leaves are sometimes applied as poultices to sores.

DOUBTFUL SPECIES.

SIPHONANDRA MEXICANA Turcz. Bull. Soc. Nat. Moscou 21²: 581. 1848. Type from Oaxaca. The genus has been referred to *Chiococca*, but the position of the plant is doubtful.

33. *Asemnanthe* Hook. f. in Benth. & Hook. Gen. Pl. 2: 106. 1873.

A single species is known.

1. *Asemnanthe pubescens* Hook. f. in Benth. & Hook. Gen. Pl. 2: 107. 1873.

Yucatán.

Shrub or small tree, 1 to 6 meters high; leaves short-petiolate, lanceolate or ovate, 2.5 to 7 cm. long, acute or acuminate, rounded to acute at base, densely pilose beneath; flowers yellow, in few-flowered axillary fascicles; calyx 4-lobate, the lobes lance-linear, persistent; corolla urceolate-tubular, longer than the calyx lobes, short-pilose, the limb with 4 small lobes; fruit drupaceous, suborbicular, compressed, 4 to 4.5 mm. long, pubescent, the cells 1-seeded.

34. *Placocarpa* Hook. f. in Benth. & Hook. Gen. Pl. 2: 107. 1873.

A single species is known.

1. *Placocarpa mexicana* Hook. f. in Benth. & Hook. Gen. Pl. 2: 108. 1873.

Veracruz and Oaxaca; type from Orizaba, Veracruz.

Shrub about 1 meter high; leaves short-petiolate, oblong or obovate-oblong, 1 to 2 cm. long, acute or obtuse, acute at base, glabrous; flowers axillary, solitary, pedicellate; calyx lobes obovate-oblong, 4 mm. long, obtuse; corolla white, salverform, the tube 10 to 12 mm. long, the 4 lobes oval, rounded at apex; fruit laterally compressed, 2-celled, separating into 2 indehiscent cocci.

35. *COFFEA* L. Sp. Pl. 172. 1753.1. *Coffea arabica* L. Sp. Pl. 172. 1753.

Cultivated in Mexico and in some localities naturalized. Native of tropical Africa; cultivated in all tropical regions.

Glabrous shrub or small tree; leaves short-petiolate, oblong-oval to lance-elliptic, 9 to 18 cm. long, acuminate, acute at base, lustrous; flowers white, glomerate in the leaf axils; calyx obscurely dentate; corolla salverform, 1.5 to 2 cm. long, the 5 lobes acute; fruit baccate, oval or subglobose, 10 to 16 mm. long, red, the 2 seeds semiellipsoid, 8 to 12 mm. long, sulcate on the inner side. "Café."

Coffee is grown in most of the warmer regions of Mexico and it is one of the important agricultural products of the country. The most important states in coffee production are Veracruz, Chiapas, Oaxaca, and Tabasco, but Veracruz is reported to produce a larger amount than all the other states combined. The shrub is said to have been cultivated first at Córdoba. It is reported to be abundant in the wild state in some parts of Veracruz.

Coffea liberica Hiern, the Liberian coffee, also is cultivated in Mexico. It is distinguished by having a 6 to 8-lobed corolla. It can be grown at lower levels than *C. arabica*, and is more robust and productive.

36. *STRUMPFIA* Jacq. Enum. Pl. Carib. 8. 1760.1. *Strumpfia maritima* Jacq. Enum. Pl. Carib. 28. 1760.

Yucatán. Florida Keys; West Indies; type from Jamaica.

Densely branched shrub, 2 meters high or less; leaves ternate, linear, 1 to 3 cm. long, acute, rigid, whitish-tomentulose beneath, the margins revolute; flowers in axillary pedunculate few-flowered racemes; calyx 5-lobate, the lobes persistent; corolla pink, deeply 5-lobate, 3 to 4 mm. long, sericeous or tomentulose; fruit drupaceous, white, 4 mm. in diameter, 1 or 2-celled. "Lirio" (Porto Rico).

In the West Indies the plant is reported to have been used as a remedy for fevers.

37. *RUDGEA* Salisb. Trans. Linn. Soc. Bot. 8: 327. 1807.1. *Rudgea fimbriata* (Benth.) Standl. in Standl. & Cald. Lista Pl. El Salvador 274. 1925.

Psychotria fimbriata Benth. Journ. Bot. Hook. 3: 226. 1841.

Chiapas. Central America and northern South America; type from the Essequibo River, British Guiana.

Glabrous shrub; leaves very short-petiolate, elliptic to lance-elliptic, mostly 9 to 15 cm. long, long-acuminate, acute or acuminate at base; flowers whitish, in small terminal panicles, the flowers mostly short-pedicellate; calyx truncate; corolla about 5 mm. long; fruit white, subglobose, 6 mm. in diameter. "Huataco" (Costa Rica).

38. *PSYCHOTRIA* L. Syst. Nat. ed. 10. 929. 1759.

Shrubs or small trees; flowers small, in terminal or axillary cymes, panicles, or corymbs; calyx tube short, the limb truncate or lobate; corolla funnelliform, the tube short or elongate, straight, the limb 4 or 5-lobate; fruit drupaceous, containing two 1-seeded nutlets.

Inflorescences all axillary-----1. *P. anomothyrsa*.

Inflorescences mostly terminal, sometimes borne in the forks of the branches.

Leaves pubescent or puberulent beneath, usually densely so, sometimes merely villous or barbate along the costa.

Bracts much exceeding the calyx, even in fruit-----2. *P. purpusii*.

Bracts small and inconspicuous.

Branchlets usually glabrous.

Corolla about 15 mm. long; leaves barbate beneath along the costa.

3. *P. pinularis*.

Corolla 5 mm. long or less; leaves not barbate beneath.

4. *P. horizontalis*.

Branchlets pubescent, puberulent, or villous.

Cymes sessile, branching from the base.

Stipules large, brown, sheathing, finally split along one side.

5. *P. undata*.

Stipules short-deltoid, not sheathing..... 6. *P. pulverulenta*.

Cymes pedunculate.

Stipules large and sheathing, brown..... 7. *P. erythrocarpa*.

Stipules small, greenish, not sheathing.

Corolla minutely granular-puberulent..... 8. *P. pubescens*.

Corolla hirtellous or villosulous..... 9. *P. hebeclada*.

Leaves glabrous beneath.

Bracts large and conspicuous.

Bracts obtuse; inflorescence loosely branched..... 10. *P. chiapensis*.

Bracts long-acuminate; inflorescence headlike or trichotomous.

11. *P. involucrata*.

Bracts small and inconspicuous.

Stipules persistent, greenish, bilobate.

Branches of the inflorescence reflexed..... 12. *P. patens*.

Branches not reflexed..... 13. *P. cuspidata*.

Stipules deciduous, brown, entire.

Leaves coriaceous, broadly obovate, broadest above the middle.

14. *P. oerstediana*.

Leaves thin, broadest at or near the middle.

Calyx lobes short, ovate or deltoid, often obtuse.

Leaves mostly elliptic and 6 to 11 cm. wide.... 15. *P. trichotoma*.

Leaves narrowly elliptic-oblong or lance-elliptic, 1.5 to 5 cm. wide.

16. *P. papantlensis*.

Calyx lobes elongate, lanceolate or linear-lanceolate.

Leaves mostly elliptic and 3 to 6 cm. wide.... 4. *P. horizontalis*.

Leaves narrowly elliptic-oblong, 1 to 2 cm. wide.

17. *P. oaxacana*.

1. *Psychotria anomothyrsa* K. Schum. & Donn. Smith, Bot. Gaz. 35: 3. 1903.

Chiapas. Central America to Peru; type from Cubilquitz, Guatemala.

Shrub, 1 to 1.5 meters high, glabrous; leaves long-petiolate, elliptic to oblong, 15 to 25 cm. long, acuminate; flowers white, in axillary pedunculate panicles; corolla about 6 mm. long; fruit white.

P. nicotianaefolia Mart. & Gal.¹ is probably closely related to this species if not identical with it.

2. *Psychotria purpusii* Standl., sp. nov.

Type from Cerro del Boquerón, Chiapas (*Purpus* 7012; U. S. Nat. Herb. no. 567269).

Branchlets sordid-villous; leaves slender-petiolate, elliptic, 9 to 12 cm. long, 4 to 5 cm. wide, acuminate, acute at base, fulvous-villosulous above, densely villosulous beneath; flowers in terminal long-pedunculate corymbs about 5 cm. broad; bracts foliaceous, equaling or longer than the flowers, the sessile or short-pedicellate; corolla 8 mm. long in bud, densely villous; fruit 6 mm. long, deeply sulcate, villous.

¹ Bull. Acad. Brux. 11¹: 229. 1844.

3. *Psychotria pinularis* Sessé & Moc. Fl. Mex. ed. 2. 57. 1894.

Sinaloa to Guerrero. West Indies and South America; type from Porto Rico.

Shrub, nearly glabrous; leaves mostly obovate, 4 to 7 cm. long, obtuse to short-acuminate, attenuate to the base, thin, glabrous except for tufts of hairs beneath in the axils of the lateral nerves; cymes few-flowered, the flowers pedicellate, white. "Crucecilla" (Sinaloa).

4. *Psychotria horizontalis* Swartz, Prodr. Veg. Ind. Occ. 44. 1788.

Sinaloa to Chiapas. Greater Antilles; Central America and northern South America.

Shrub, 4 meters high or less; leaves short-petiolate, narrowly or broadly elliptic, 5 to 12 cm. long, long or short-acuminate, acute or obtuse at base, rufous-villous beneath along the costa or glabrous; cymes slender-pedunculate, usually many-flowered; fruit red.

5. *Psychotria undata* Jacq. Pl. Hort. Schönbr. 3: 5. pl. 260. 1798.

Psychotria rufescens H. B. K. Nov. Gen. & Sp. 3: 364. 1818.

Veracruz; Oaxaca (?). Florida; West Indies; Central America.

Shrub, 1 to 3 meters high; stipules thin, brown, deciduous; leaves elliptic-oblong to elliptic, 15 cm. long or less, acuminate, pubescent or glabrate; inflorescence fulvous-villous; corolla white; fruit 5 to 6 mm. long, red, glabrous or pubescent. "Huesito" (Panama).

Psychotria sessilifolia Mart. & Gal.,¹ described from Veraacruz, is perhaps to be referred here.

6. *Psychotria pulverulenta* Urban, Symb. Antill. 7: 456. 1913.

Reported from Mexico (San Luis Potosí ?) by Urban. Florida; Greater Antilles; Cuba.

Leaves lanceolate or elliptic-lanceolate, 7 to 15 cm. long, acuminate, pilosulous or puberulent beneath; cymes often borne in the forks of the branches; corolla 3 mm. long, glabrous; fruit 10-costate, 3.5 to 4 mm. long.

7. *Psychotria erythrocarpa* Schlecht. Linnaea 9: 595. 1834.

Tamaulipas and San Luis Potosí to Chiapas; type from Hacienda de la Laguna, Veracruz.

Shrub, the branchlets densely pubescent; leaves short-petiolate, mostly obovate or oblong-obovate, 4 to 9 cm. long, obtuse to short-acuminate, obtuse to attenuate at base, densely pubescent beneath; cymes short and small, usually 2 to 3 cm. wide; corolla pubescent; fruit red, pubescent.

Closely related and perhaps not specifically different is *Mapouria chamissoana* Loesener (Verh. Bot. Ver. Brand. 56: 112. 1923).

8. *Psychotria pubescens* Swartz, Prodr. Veg. Ind. Occ. 44. 1788.

Guerrero to Veraacruz. West Indies and Central America.

Shrub, 1 to 3 meters high; leaves short-petiolate, oblanceolate to elliptic, 6 to 14 cm. long, acuminate, acute at base, thin, finely puberulent beneath; inflorescence corymbose, loosely many-flowered, pubescent; corolla white, about 4 mm. long; fruit red.

9. *Psychotria hebeclada* DC. Prodr. 4: 513. 1830.

Veraacruz and Oaxaca and perhaps elsewhere. Central America and Panama.

Shrub, 1 to 1.5 meters high, the branches densely pubescent; leaves short-petiolate, lance-oblong to elliptic, 7 to 18 cm. long, acuminate, acute to attenuate at base, thin; inflorescence corymbose, the flowers white or pinkish; fruit 3.5 mm. broad. "Huesito" (Panama).

¹ Bull. Acad. Brux. 11: 228. 1844.

Psychotria aureola Bartl.,¹ *P. justicioides* Schlecht.,² and *P. bracteolata* Mart. & Gal.³ all appear to be closely related to this species, judging from descriptions.

10. *Psychotria chiapensis* Standl., sp. nov.

Type from Finca Mexiquito, Chiapas (*Purpus* 6963; U. S. Nat. Herb. no. 567237).

Branchlets obscurely villosulous or glabrate; stipules green, persistent, 3 to 4 mm. long, bilobate, the lobes broad, obtuse; leaves petiolate, oblong-elliptic, 11.5 to 23 cm. long, 5 to 10 cm. wide, short-acuminate, acute at base, thin, glabrous; cymes pedunculate or sessile, trichotomous, 5 to 7 cm. broad, many-flowered, the flowers sessile, the bracts broad, rounded at apex; calyx limb 5 to 6 mm. long, puberulent, denticulate; corolla in bud 1.5 cm. long, nearly glabrous.

11. *Psychotria involucrata* Swartz, Prodr. Veg. Ind. Occ. 45. 1788.

Veracruz. West Indies; Central and South America.

Shrub, glabrous nearly throughout; leaves petiolate, ovate or elliptic, 8 to 14 cm. long, acuminate, acute at base; inflorescence at first dense and headlike, pedunculate, in age branched; fruit 3 to 4 mm. long, sharply costate.

12. *Psychotria patens* Swartz, Prodr. Veg. Ind. Occ. 45. 1788.

Psychotria flexuosa Willd. Sp. Pl. 1: 966. 1798.

Chiapas. Greater Antilles; Central America to Bolivia.

Shrub, 1 to 2 meters high, nearly glabrous; leaves short-petiolate, lanceolate to elliptic, 5 to 14 cm. long, usually long-acuminate; panicles long-pedunculate, narrow and thyrsiform; corolla white, 5 to 8 mm. long; fruit blue or black, 3 to 5 mm. broad.

13. *Psychotria cuspidata* Bredemeyer; Roem. & Schult. Syst. Veg. 5: 192. 1819.

Oaxaca, Chiapas, and Tabasco. Cuba; Central America to Brazil.

Slender shrub, nearly glabrous; leaves petiolate, ovate to elliptic or oblong-lanceolate, 7 to 18 cm. long, usually cuspidate-acuminate, acute or obtuse at base, thin, lustrous; panicles small, 1 to 3 cm. broad; corolla about 4 mm. long; fruit didymous, 4 mm. broad.

14. *Psychotria oerstediana* Standl.

Mapouria obovata Oerst. Amér. Centr. 17. pl. 14, f. 3, 4. 1863.

Psychotria obovata Hemsl. Biol. Centr. Amer. Bot. 2: 50. 1881. Not *P. obovata* Ruiz & Pav. 1799.

Veracruz.

Shrub, 1 to 1.5 meters high; leaves short-petiolate, 6 to 13 cm. long, rounded to short-acuminate at apex, cuneate at base, pale green; inflorescence short and dense at anthesis, open in fruit, sessile or nearly so; corolla about 5 mm. long; fruit glabrous.

15. *Psychotria trichotoma* Mart. & Gal. Bull. Acad. Brux. 11¹: 227. 1844.

Veracruz, Oaxaca, and Chiapas; type from the region of Jalapa and Mirador, Veracruz. Guatemala.

Shrub, 4.5 meters high or less; leaves short-petiolate, 10 to 25 cm. long, usually short-acuminate, acute at base; inflorescence usually large and much branched, puberulent; fruit sometimes 1 cm. long.

¹ DC. Prodr. 4: 513. 1830.

² Linnaea 9: 596. 1834.

³ Bull. Acad. Brux. 11¹: 228. 1844.

16. *Psychotria papantlensis* (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 50. 1881.

Mapouria salicifolia Oerst. Amér. Centr. 17. pl. 14, f. 2. 1863.

?*Mapouria stipulata* Oerst. Amér. Centr. 17. pl. 14, f. 7. 1863.

?*Mapouria miradorensis* Oerst. Amér. Centr. 17. pl. 14, f. 9. 1863.

Psychotria salicifolia Hemsl. Biol. Centr. Amer. Bot. 2: 51. 1881. Not *P. salicifolia* H. B. K. 1818.

San Luis Potosí and Veracruz; Yucatán (?); type from Papantla, Veracruz.

Small shrub, nearly glabrous; leaves short-petiolate, 5 to 17 cm. long, acuminate, attenuate at base; cymes mostly sessile or nearly so, dense or in age open, the flowers white. "Cancerillo" (Yucatán), "pochitoco" (Veracruz).

17. *Psychotria oaxacana* Standl., sp. nov.

Type from Santo Domingo, Oaxaca, altitude 480 meters (Nelson 2688; U. S. Nat. Herb. no. 574444).

Branches slender, glabrous; leaves short-petiolate, lance-oblong or narrowly elliptic-oblong, 4 to 7 cm. long, 1 to 2 cm. wide, long-acuminate, acute or attenuate at base, thin, glabrous, blackish when dry; cymes on long slender peduncles, 1 to 2 cm. wide, the flowers short-pedicellate, glabrous; calyx lobes lance-subulate; corolla 3 mm. long, the lobes obtuse; anthers exerted.

DOUBTFUL SPECIES.

PSYCHOTRIA BIARISTATA Bartl.; DC. Prodr. 4: 513. 1830. Type from somewhere in Mexico; reported from Oaxaca.

PSYCHOTRIA LIMONENSIS LAXINERVIA Loesener, Repert. Sp. Nov. Fedde 18: 361. 1922. Type from Palenque, Chiapas. The species was described from the Atlantic coast of Costa Rica.

PSYCHOTRIA PADIFOLIA Willd.; Roem. & Schult. Syst. Veg. 5: 189. 1819. Type from Jalapa, Veracruz.

PSYCHOTRIA SCABRIUSCULA Bartl.; DC. Prodr. 4: 513. 1830. Type from Acapulco, Guerrero.

PSYCHOTRIA TOMENTOSA (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 51. 1881. *Mapouria tomentosa* Oerst. Amér. Centr. 17. pl. 14, f. 8. 1863. Type from Papantla, Veracruz.

39. *EVEA* Aubl. Pl. Guian. 1: 103. 1775.

Shrubs or small trees; flowers in terminal heads, these subtended by large or small, sessile, often connate bracts; calyx dentate, persistent; corolla funnellform or salverform, the tube straight, the limb 4 or 5-lobate, the lobes valvate; fruit drupaceous, containing 2 bony nutlets, these smooth or costate, 1-seeded.

Plants hirsute..... 1. *E. tomentosa*.

Plants glabrous or nearly so.

Leaves petiolate; stipules bilobate, not setiferous..... 2. *E. elata*.

Leaves sessile; stipules setiferous, not bilobate..... 3. *E. chiapensis*.

1. *Evea tomentosa* (Aubl.) Standl. Contr. U. S. Nat. Herb. 18: 123. 1916.

Tapogomea tomentosa Aubl. Pl. Guian. 1: 160. 1775.

Cephaelis tomentosa Vahl, Eclog. Amer. 1: 19. 1796.

Cephaelis hirsuta Mart. & Gal. Bull. Acad. Brux. 11¹: 135. 1844.

Veracruz, Oaxaca, and Tabasco. Central and South America.

Shrub, 1 to 4 meters high, hirsute throughout; leaves short-petiolate, elliptic to elliptic-oblong, 10 to 25 cm. long, acuminate, acute at base; heads long-pedunculate, the bracts 3 to 6 cm. broad, bright red; corolla yellow.

2. *Evea elata* (Swartz) Standl. Contr. U. S. Nat. Herb. **18**: 123. 1916.*Cephaelis elata* Swartz, Prodr. Veg. Ind. Occ. 45. 1788.*Cephaelis punicea* Vahl, Eclog. Amer. **1**: 19. 1796.

Oaxaca and Chiapas. West Indies and Central America.

Shrub; leaves oblong-oblong to elliptic-oblong, 10 to 25 cm. long, acuminate, acute to attenuate at base; heads often trichotomous, the bracts large, red or purplish.

3. *Evea chiapensis* Standl., sp. nov.Type from Cerro del Boquerón, Chiapas (*Purpus* 6928; U. S. Nat. Herb. no. 567214).

Glabrous shrub; leaves sessile, lanceolate or oblong-lanceolate, 7 to 11 cm. long, long-acuminate, narrowed to the base, thin, very lustrous above; heads terminal, the peduncles about 1 cm. long; bracts green, 12 to 15 mm. long, acute, short-connate.

40. PALICOUREA Aubl. Pl. Guian. **1**: 172. 1775.

Shrubs or small trees; flowers small, in chiefly terminal, usually thyrsiform panicles, sometimes corymbose; calyx entire or 5-lobate; corolla tube elongate, straight or curved, often gibbous, the limb 5-lobate, the lobes valvate; fruit baccate, usually containing 2 1-seeded nutlets.

Calyx lobate; flowers in pedunculate panicles..... **1. *P. galeottiana*.**Calyx truncate; flowers in sessile corymbs..... **2. *P. nigrescens*.****1. *Palicourea galeottiana*** Mart. Bull. Acad. Brux. **11**¹: 136. 1844.*?Psychotria mexicana* Willd.; Roem. & Schult. Syst. Veg. **5**: 189. 1819.*Palicourea mexicana* Benth.; Oerst. Nat. For. Kjöbenhavn Vid. Medd. **1852**: 37. 1853.*Palicourea costaricensis* Benth.; Oerst. Nat. For. Kjöbenhavn Vid. Medd. **1852**: 38. 1853.

Veracruz, Puebla, Oaxaca, and Chiapas; type from Oaxaca. Central America and Panama.

Shrub, 2 to 4.5 meters high, glabrous or nearly so; stipules bilobate; leaves short-petiolate, oblong or elliptic-oblong, 7 to 20 cm. long, acuminate, acute at base; panicles longer or shorter than the leaves, the branches yellowish or reddish; corolla orange, 1.5 to 2 cm. long; fruit about 5 mm. in diameter.

2. *Palicourea nigrescens* Mart. & Gal. Bull. Acad. Brux. **11**¹: 136. 1844.

Veracruz; type from Jalapa.

Shrub; leaves short-petiolate, ovate-lanceolate or elliptic-oblong, 10 to 15 cm. long, acuminate, acute or attenuate at base, glabrous or nearly so; corymbs much shorter than the leaves; corolla pink, 6 to 7 mm. long.

DOUBTFUL SPECIES.

PALICOUREA GARDENIOIDES (Scheidw.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. **2**: 52. 1881. *Rhodostoma gardenioides* Scheidw. in Otto & Dietr. Allgem. Gartenzeit **10**: 286. 1842. Veracruz.**41. PAEDERIA** L. Mant. Pl. **1**: 7. 1767.**1. *Paederia pringlei*** Greenm. Proc. Amer. Acad. **39**: 92. 1903.

Guerrero and Morelos; type from Yautepec, Morelos, altitude 1,385 meters.

Slender shrub, scandent to a height of 6 meters; leaves long-petiolate, ovate or broadly ovate, 3 to 8 cm. long, abruptly acuminate, rounded or cordate at base, villous beneath or finally glabrate; flowers in lax axillary cymes or panicles; calyx lobes linear or lanceolate; corolla funnelform, 12 to 14 mm. long; fruit oval, 10 to 12 mm. long, glabrous, strongly compressed, 2-celled, each cell 1-seeded.

42. **FARAMEA** Aubl. Pl. Guian. 1: 102. 1775.

1. **Faramea occidentalis** (L.) A. Rich. Mém. Soc. Hist. Nat. Paris 5: 176. 1834.

Izora occidentalis L. Syst. Nat. ed. 10. 893. 1759.

Faramea odoratissima DC. Prodr. 4: 496. 1830.

Veracruz. West Indies; Central and South America.

Glabrous shrub or tree, sometimes 15 meters high; bark smooth, gray; leaves short-petiolate, narrowly oblong to oval, 6 to 18 cm. long, cuspidate-acuminate, acute at base, coriaceous, lustrous; flowers white, fragrant, in terminal and axillary, lax, few-flowered cymes, pedicellate; calyx truncate; corolla salverform, the tube about 17 mm. long, the lobes narrow, 12 mm. long; fruit nearly 1 cm. in diameter, drupaceous, finally black, 1-celled, 1-seeded; sapwood thin, nearly white, the heartwood darker, tinged with yellow, hard, moderately heavy, very tough, close-grained, taking a good polish. "Hueso" (Veracruz, *Ramírez*); "huesito" (Panama); "palo de toro," "cafetillo" (Porto Rico); "café cimarrón," "nabaco," "jujano" (Cuba); "cafecillo" (El Salvador).

43. **MORINDA** L. Sp. Pl. 176. 1753.

1. **Morinda yucatanensis** Greenm. Field Mus. Bot. 2: 262. 1907.

Yucatán; type from Izamal.

Shrub, subsucculent; leaves short-petiolate, lance-oblong to oblong-obovate or elliptic, 5 to 12 cm. long, acute or acuminate, acute or attenuate at base, pubescent, especially beneath; flowers in short-pedunculate or sessile, globose heads 12 mm. or less in diameter, coalescent in fruit; calyx truncate; corolla tubular-funnelform, 7 mm. long, the limb 5-lobate; fruit a succulent syncarp; nutlets 6 mm. long, smooth. "Joyoc," "xo-yen-cab" (Maya).

The Yucatán plant has been referred to *M. royoc* L., a closely related species of Central America and the West Indies.

44. **ERNODEA** Swartz, Prodr. Veg. Ind. Occ. 29. 1788.

1. **Ernodea litoralis** Swartz, Prodr. Veg. Ind. Occ. 29. 1788.

Yucatán. Southern Florida, West Indies, and Honduras, on coastal rocks and sands.

Prostrate or spreading shrub; leaves crowded, lanceolate or lance-oblong, 1 to 2.5 cm. long, acute, narrowed below, sessile or nearly so, coriaceous, leathery, glabrous, 3-nerved; flowers yellow, solitary and sessile in the leaf axils; calyx 4 to 6-lobate, the lobes lance-subulate; corolla funnelform, the tube 1 cm. long, the 4 to 6 lobes narrow, valvate; fruit drupaceous, 2-celled, yellow, 4 to 6 mm. long, the nutlets cartilaginous, united, 1-seeded.

45. **TRIODON** DC. Prodr. 4: 566. 1830.

1. **Triodon angulatum** Benth. Pl. Hartw. 70. 1840.

Veracruz, Oaxaca, and Chiapas; reported from Tabasco or Yucatán; type from Teotolcingo, Oaxaca. Guatemala.

Erect or prostrate shrub, glabrous or puberulent; leaves oblong to elliptic, 4 to 20 mm. long, opposite or often appearing verticillate, obtuse or acute, short-petiolate; flowers clustered in the leaf axils; calyx 4-dentate; corolla about 2 mm. long; fruit small, dicocous, 2-seeded.

46. **GALIUM** L. Sp. Pl. 105. 1753.

Herbs or rarely shrubs; leaves verticillate; flowers small, usually in axillary or terminal cymes, white or yellow; calyx limb obsolete; corolla rotate, commonly 4-lobate, the lobes valvate; fruit didymous, dry or fleshy, 2-celled, indehiscent.

Numerous herbaceous species occur in Mexico.

Fruit hirsute.....1. *G. stellatum*.
 Fruit glabrous.....2. *G. angulosum*.

1. *Galium stellatum* Kellogg, Proc. Calif. Acad. 2: 97. f. 26. 1863.

Baja California; type from Cedros Island. Utah, Arizona, and southern California.

Much-branched shrub, 60 cm. high or less, the branchlets hirtellous; leaves in 4's or 5's, linear-lanceolate to ovate, 5 to 15 mm. long, 1-nerved; corolla white.

2. *Galium angulosum* A. Gray, Proc. Amer. Acad. 11: 74. 1876.

Guadalupe Island, Baja California.

Branchlets hirsute-pubescent; leave in whorls of 4 to 7, linear-oblong or elliptic-oblong, 6 to 10 mm. long, acute; corolla greenish white.

DOUBTFUL GENERA.

BERGHESIA COCCINEA Nees, Linnaea 20: 702. 1847. Type from somewhere in Mexico.

154. CAPRIFOLIACEAE. Honeysuckle Family.

Shrubs or trees; leaves opposite, usually stipulate; flowers perfect, regular or irregular; calyx tube adnate to the ovary, the limb 3 to 5-dentate or lobate; corolla gamopetalous, the limb regular or irregular, often bilabiate, the 5 lobes imbricate; stamens usually 5, inserted on the corolla tube; style simple or parted; ovules usually solitary in the cell; fruit baccate, drupaceous, or dry, 1 to 5-celled.

Leaves pinnate.....1. *SAMBUCUS*.

Leaves simple.

Corolla rotate or nearly so.....2. *VIBURNUM*.

Corolla tubular or funnelform.

Fruit dry; flowers in terminal cymes.....3. *ABELIA*.

Fruit fleshy; flowers mostly axillary, or in terminal spikes or heads.

Cells of the ovary 1-ovulate; plants erect; flowers mostly sessile in the leaf axils.....4. *SYMPHORICARPOS*.

Cells of the ovary many-ovulate; plants erect or scandent; flowers never sessile in the axils.....5. *LONICERA*.

1. *SAMBUCUS* L. Sp. Pl. 269. 1753.

Shrubs or trees; leaves pinnate or bipinnate, the leaflets serrate; flowers small, white, in terminal flat-topped cymes; calyx 3 to 5-dentate; corolla rotate, 3 to 5-lobate; fruit a small drupe, containing 3 to 5 1-seeded nutlets.

The English name for plants of the genus is "elderberry." The fruit of all species is edible and is often used in the United States for pies and for making wine. The stems contain a large amount of pith. A decoction of the stems is employed by some of the Indians for dyeing baskets black. In Europe the leaves and flowers have been used for dyeing leather yellow, and the bark or wood, with alum and iron salts, for dyeing green or brown. In Germany oil has been extracted from the seeds, and the flowers are used to flavor wine.

The flowers of *S. canadensis* L. were formerly official in the United States Pharmacopoeia, and those of the Old World *S. nigra* L. are now official in some of the European pharmacopoeias. They have gently excitant and sudorific properties. The fruit is diaphoretic and aperient and has been used as an alterative in treating rheumatism and syphilis. The inner bark is a hydragogue cathartic and in large doses emetic. It has been employed for dropsy and epilepsy.

Leaflets pubescent on one or both surfaces; fruit not glaucous...1. *S. mexicana*.

Leaflets glabrous; fruit glaucous.....2. *S. caerulea*.

1. Sambucus mexicana Presl; DC. Prodr. 4: 322. 1830.*Sambucus bipinnata* Schlecht. & Cham. Linnaea 5: 171. 1830.

Widely distributed in Mexico, especially in cultivation. Western Texas to southern California; Central America.

Tree, sometimes 10 meters high, with a trunk 30 cm. in diameter, the bark thick, gray, scaly; leaflets usually 5, ovate to ovate-lanceolate or oval, 3 to 12 cm. long, short-acuminate, pale; cymes 6 to 20 cm. broad; corolla 5 to 8 mm. broad; fruit about 6 mm. in diameter, nearly black; wood soft, coarse-grained, brownish, its specific gravity about 0.46. Usually known in Mexico as "saúco"; "azumiatl" (Veracruz); "cumdemba," "cumdumba" (Tarascan); "xumetl" (*Urbina*); "nttzirza" (Otomí); "bixhumí" (Oaxaca, Zapotec, *Reko*); "yutnucate" (Oaxaca, Mixtec, *Reko*); "shiksh" (Mixe, *Belmar*); "coyopa" (Zoque, *Gonzales*).

The fruit is used in Mexico for various purposes. Some of the Indians of southern California dried it for winter use. The flowers have a heavy odor. They are used medicinally in Mexico, and other parts of the plant are used much as described above. The leaves are sometimes bound upon the forehead to relieve headache.

Sambucus mexicana bipinnata (Schlecht. & Cham.) Schwerin¹ is a form with bipinnate leaves. It was described from Jalapa, Veracruz.

2. Sambucus caerulea Raf. Alsogr. Amer. 48. 1838.*Sambucus glauca* Nutt.; Torr. & Gray, Fl. N. Amer. 2: 13. 1841.*Sambucus neomexicana* Wooton, Bull. Torrey Club 25: 309. 1898.

Northern Baja California, Sonora, and Chihuahua. Western United States.

Shrub or tree, sometimes 15 meters high, with a trunk 45 cm. in diameter; bark dark brown, fissured and scaly; leaflets 5 or 7, lanceolate or oblong, 8 to 12 cm. long, attenuate; cymes 10 to 15 cm. broad; corolla 4 to 6 mm. broad; fruit 5 to 7 mm. in diameter, bluish black; wood soft, weak, coarse-grained, dark yellowish brown, its specific gravity about 0.50. "Saúco" (California).

2. VIBURNUM L. Sp. Pl. 267. 1753.

Shrubs or small trees; leaves entire or toothed; flowers small, white, in dense cymes; calyx 5-dentate; corolla rotate or broadly campanulate, regular, 5-lobate; fruit drupaceous, 1 to 3-celled.

Numerous species of the genus (mostly known as "black haw") grow in the United States. The fruit is edible, but in most cases insipid. The leaves of some species have been used in the southern United States as a substitute for Chinese tea.

Lateral nerves of the leaves straight, prominent, extending to the margin; leaves conspicuously dentate, often cordate at base, sometimes densely stellate-tomentose beneath.

Calyx lobes lanceolate, equaling the corolla..... 1. *V. stenocalyx*.

Calyx lobes obtuse, much shorter than the corolla.

Cymes long-pedunculate, the peduncles longer than the cymes.

Leaves densely grayish-tomentose beneath..... 2. *V. loeseneri*.

Leaves green beneath, sparsely pubescent..... 3. *V. membranaceum*.

Cymes short-pedunculate, the peduncles equaling or shorter than the cymes.

Leaves covered beneath with a dense close whitish tomentum.

4. *V. microcarpum*.

Leaves glabrate beneath or with a loose coarse tomentum.

Calyx lobes not ciliate..... 5. *V. ciliatum*.

¹ Mitt. Deutsch. Dendr. Ges. 1909: 34, 328. 1909.

Calyx lobes ciliate.

Leaves gradually acute or acuminate.....6. *V. rhombifolium*.

Leaves abruptly acuminate or caudate-acuminate.

Calyx hirtellous; leaves pilose on the upper surface.

7. *V. tiliaefolium*.

Calyx merely glandular; leaves glabrous or nearly so on the upper surface.....8. *V. caudatum*.

Lateral nerves of the leaves curved, inconspicuous, anastomosing before reaching the margin; leaves entire or nearly so, not cordate at base, never densely stellate-pubescent beneath.

Cymes sessile.

Leaves broadly rounded at apex, remotely dentate or entire.

9. *V. cuneifolium*.

Leaves obtuse to acuminate, usually entire.....10. *V. elatum*.

Cymes pedunculate.

Peduncles and branchlets glabrous.....11. *V. acutifolium*.

Peduncles and branchlets variously pubescent.

Leaves pulverulent-tomentose beneath.....12. *V. sulcatum*.

Leaves glabrous beneath or with scattered stellate hairs.

Leaves obtusely acuminate; branches of the inflorescence hirtellous.

13. *V. hartwegii*.

Leaves acutely acuminate; branches of the inflorescence finely stellate-pubescent.

Calyx lobes acute; leaves entire.....14. *V. microphyllum*.

Calyx lobes obtuse; leaves remotely dentate.....15. *V. stellatum*.

1. *Viburnum stenocalyx* (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 3. 1881.

Oreinotinus stenocalyx Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 285. 1861.

Type from somewhere in Mexico.

Branches villous-tomentose; leaves oblong-ovate, 6 to 7.5 cm. long, acuminate, obtuse at base, irregularly dentate, stellate-pubescent; cymes pedunculate; calyx tube glandular.

2. *Viburnum loeseneri* Graebn. Repert. Sp. Nov. Fedde 12: 244. 1913.

Described from Mexico, probably from Veracruz.

Branchlets densely stellate-pilose; leaves ovate, 1.5 to 3 cm. long, acuminate, rounded at base, sparsely pilose above, entire or obscurely crenate-dentate; cymes dense, 6 to 15-flowered, the branches stellate-tomentose.

3. *Viburnum membranaceum* (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 2. 1881.

Oreinotinus membranaceus Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 284. 1861.

Nuevo León to Hidalgo and Oaxaca; type from Cuesta de San Juan, Oaxaca.

Shrub, 1 to 2 meters high; leaves ovate or rounded-ovate, 3 to 5.5 cm. long, acuminate, cordate at base, coarsely serrate-dentate, glabrate above; calyx tube glandular or glabrate, the lobes obtuse.

4. *Viburnum microcarpum* Schlecht. & Cham. Linnaea 5: 179. 1830.

Viburnum microcarpum evanescens Greenm. Proc. Amer. Acad. 35: 313. 1900.

Veracruz and Oaxaca; type from San Miguel del Soldado, Veracruz.

Shrub or tree, 6 meters high or less; leaves rounded-ovate or suborbicular, 4 to 7 cm. long, obtuse or acutish, dentate, green and glabrate above; cymes broad, many-flowered; calyx lobes obtuse; corolla 4 mm. broad.

5. **Viburnum ciliatum** Greenm. Proc. Amer. Acad. 41: 251. 1905.
Type from Trinidad Iron Works, Hidalgo, altitude 1,680 meters; Guerrero (?).
Branchlets glandular or glabrate; leaves ovate or broadly ovate, 5 to 10 cm. long, short-acuminate, cordate at base, dentate, ciliate, nearly glabrous; calyx lobes obtuse; corolla 5 mm. broad.
6. **Viburnum rhombifolium** (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 3. 1881.
Oreinotinus rhombifolius Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 283. 1861.
Mountains of Mexico and Veraacruz; type from Mount Orizaba, altitude 2,700 meters.
Shrub or tree, 3 to 6 meters high, the branchlets stellate-pilose; leaves oblong-ovate, ovate, or rhombic, 5 to 15 cm. long, coarsely serrate-dentate, appressed-pilose or glabrate above, loosely stellate-pilose beneath; calyx lobes obtuse.
7. **Viburnum tiliaefolium** (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 3. 1881.
Oreinotinus tiliaefolius Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 282. 1861.
Veraacruz and Oaxaca; type collected between Mirador and Jalapa, Veraacruz.
Branchlets loosely tomentose; leaves broadly ovate or rounded-ovate, 7 to 13 cm. long, cordate or rounded at base, thin, irregularly sinuate-dentate, ciliate; cymes broad, many-flowered; corolla 7 mm. broad.
8. **Viburnum caudatum** Greenm. Proc. Amer. Acad. 41: 250. 1905.
Type collected near Trinidad Iron Works, Hidalgo, altitude 1,500 meters.
Shrub or tree, 4.5 to 6 meters high, the branchlets glabrate; leaves rounded-ovate or rhombic, 9 to 11 cm. long, cordate or subcordate at base, obscurely sinuate-dentate or entire, nearly glabrous beneath; cymes broad, many-flowered; corolla 6 to 7 mm. broad.
9. **Viburnum cuneifolium** Bartlett, Proc. Amer. Acad. 44: 635. 1909.
Type collected in the Sierra Madre above Monterrey, Nuevo León, altitude 750 meters.
Shrub, 3 to 4.5 meters high, the branchlets ferruginous-furfuraceous; leaves mostly suborbicular, rounded or obtuse at base, glabrous or nearly so; corolla 6 mm. broad.
Probably only a form of *V. elatum*.
10. **Viburnum elatum** Benth. Pl. Hartw. 59. 1840.
? *Viburnum densum* Benth. Pl. Hartw. 59. 1840.
Michoacán to San Luis Potosí and Mexico; type from Tlapujahua, Michoacán.
Large shrub or small tree, the branchlets furfuraceous; leaves ovate-oblong to broadly ovate, 2.5 to 5.5 cm. long, acute to rounded at base, glabrous; fruit black, about 1 cm. long. "Tlamahuacatl" (*Ramírez*).
11. **Viburnum acutifolium** Benth. Pl. Hartw. 59. 1840.
Oreinotinus fuscus Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 289. 1861.
Viburnum fuscum Hemsl. Biol. Centr. Amer. Bot. 2: 2. 1881.
Oaxaca; type from Cerro Pelado.
Leaves ovate to lance-oblong, 3.5 to 6 cm. long, acutely acuminate, acute to rounded at base, entire, glabrous, pale beneath; fruit black, 6 to 7 mm. long.
12. **Viburnum sulcatum** (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 3. 1881.
Oreinotinus sulcatus Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 287. 1861.
Type from Mount Zempoaltepec, Oaxaca.
Branchlets fuscous-tomentose; leaves ovate, about 7 cm. long, obtusely acuminate, entire, glabrous above.

13. *Viburnum hartwegii* Benth. Pl. Hartw. 84. 1841.

Chiapas. Central America; type from mountains of Santa María, Guatemala. Shrub or small tree; leaves lance-oblong to oval, 6 to 13 cm. long, long-acuminate, acute to rounded at base, pubescent or glabrate beneath; cymes large and broad; corolla 4 to 5 mm. broad; fruit about 1 cm. long. "Curá" (Costa Rica).

Perhaps not distinct from *V. glabratum* H. B. K. of Peru.

The following Mexican names are reported, but they probably belong to other species: "Achichil," "sunda," "carindapaz" (Hidalgo).

14. *Viburnum microphyllum* (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 3. 1881.

Orcinotinus microphyllus Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 293. 1861.

Jalisco to Oaxaca; type from Cuesta de San Pedro Alto.

Shrub or small tree, 6 meters high or less, the branchlets finely stellate-pubescent; leaves oblong to oblong-ovate, 4 to 7 cm. long, acuminate, acute to rounded at base, glabrous or nearly so; fruit black, 6 to 7 mm. long.

15. *Viburnum stellatum* (Oerst.) Hemsl. Biol. Centr. Amer. Bot. 2: 3. 1881.

Orcinotinus stellatus Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1860: 292. 1861.

Veracruz and Puebla; type from Mount Orizaba, at an altitude of 2,400 meters. Costa Rica.

Branchlets stellate-pubescent; leaves ovate or oblong-ovate, 6 to 7.5 cm. long, obtuse or rounded at base, sparsely stellate-pubescent; cymes broad and many-flowered.

DOUBTFUL SPECIES.

VIBURNUM PARVIFLORUM Mart. & Gal. Bull. Acad. Brux. 11¹: 243. 1844. Type from Zacatepec, Oaxaca.

3. *ABELIA* R. Br. in Abel, Narr. Journ. China App. B. 376. 1818.

Shrubs; leaves short-petiolate, entire or dentate; flowers in chiefly terminal, few-flowered cymes; calyx 2 to 5-lobate; corolla tubular or funnellform, the limb 5-lobate; fruit a leathery achene.

The other species are natives of Asia.

Corolla 3 to 4.5 cm. long-----1. ***A. floribunda***.
Corolla about 1.5 cm. long-----2. ***A. coriacea***.

1. *Abelia floribunda* (Mart. & Gal.) Decaisne, Fl. Serr. Jard. 2: pl. 5. 1846.

Vesalea floribunda Mart. & Gal. Bull. Acad. Brux. 11¹: 242. 1844.

Vesalea hirsuta Mart. & Gal. Bull. Acad. Brux. 11¹: 242. 1844.

Abelia speciosa Decaisne, Fl. Serr. Jard. 2: pl. 5. 1846.

Veracruz, Puebla, and Oaxaca; type from Pico de Orizaba, Veracruz.

Shrub, 2 to 3 meters high; leaves elliptic-oblong to rounded-ovate, 8 to 30 mm. long, obtuse, thin, ciliate, nearly entire; calyx lobes sometimes 13 mm. long, oblong or linear-lanceolate; corolla red-purple.

2. *Abelia coriacea* Hemsl. Diag. Pl. Mex. 53. 1880.

Nuevo León and San Luis Potosí; type from San Luis Potosí.

Leaves oblong-ovate to rounded-ovate, 1 to 2 cm. long, obtuse or acutish, glabrous, coriaceous, lustrous; calyx lobes linear, 7 mm. long or less, puberulent or hirtellous; corolla puberulent.

4. *SYMPHORICARPOS* Ludwig, Def. Gen. Pl. 35. 1760.

Shrubs; leaves short-petiolate, entire or on young branches sinuate-lobate; flowers in axillary or terminal clusters, white or pinkish; calyx 4 or 5-dentate; corolla salverform, 4 or 5-lobate; fruit a small subglobose 2-seeded berry.

- Anthers equaling the corolla lobes.....1. **S. microphyllus**.
 Anthers shorter than the corolla lobes.....2. **S. rotundifolius**.

1. **Symphoricarpos microphyllus** H. B. K. Nov. Gen. & Sp. 3: 424. 1818.

Symphoricarpos glaucescens H. B. K. Nov. Gen. & Sp. 3: 424. pl. 295. 1818.

Symphoricarpos montanus H. B. K. Nov. Gen. & Sp. 3: 425. pl. 296. 1818.

Margaris barbiger DC. Prodr. 4: 483. 1830.

?*Margaris nudiflora* DC. Prodr. 4: 483. 1830.

Chiococca axillaris Sessé & Moc. Pl. Nov. Hisp. 36. 1887.

Coahuila to Colima, Oaxaca, and Veraacruz; type from Morán, Hidalgo.

Shrub, 1 to 2.5 meters high; leaves ovate to rounded, 5 to 20 mm. long, obtuse or acute, pubescent or glabrate, often glaucous beneath; corolla about 1 cm. long, pinkish; fruit white. "Perlilla," "perlitas" (Mexico).

2. **Symphoricarpos rotundifolius** A. Gray, Pl. Wright. 2: 66. 1853.

Mountains of northeastern Sonora. New Mexico to Idaho, Washington, and California; type from Santa Rita, New Mexico.

Slender shrub, about 1 meter high; leaves broadly ovate to orbicular, 1 to 2.5 cm. long, obtuse or rounded at apex, pubescent beneath; corolla pinkish, 6 to 8 mm. long; fruit white.

5. **LONICERA** L. Sp. Pl. 173. 1753.

REFERENCE: Rehder, Synopsis of the genus *Lonicera*, Rep. Mo. Bot. Gard. 14: 27-232. pl. 1-20. 1903.

Erect or scandent shrubs; leaves entire; flowers spicate, capitata, or geminate, often irregular; calyx 5-dentate; corolla tubular, funnelform, or campanulate, the limb 5-lobate or bilabiate; fruit a fleshy berry, few-seeded.

Some of the Old World species of honeysuckle (Spanish, "madreselva") are cultivated in Mexican gardens. The flowers of the Old World *L. caprifolium* L. are sometimes used in Europe for making perfumery, and a syrup of the fruit has been employed for treating asthma. The fruits of all species are said to be emetic and cathartic, and that of *L. xylosteum* L. is reported to have caused serious poisoning.

Flowers borne on axillary, mostly 2-flowered peduncles.

Bracts at base of the flowers large, reddish, accrescent in age; leaves acuminate.

1. **L. involucrata**.

Bracts small, subulate; leaves mostly obtuse or rounded at apex.

2. **L. mexicana**.

Flowers in terminal spikes or heads.

Upper leaves not united around the stem; corolla about 12 mm. long.

3. **L. subspicata**.

Uppermost leaves united by their bases around the stem; corolla 1.7 to 5.5 cm. long.

Corolla funnelform, about 2 cm. long.....4. **L. albiflora**.

Corolla tubular, 4 to 5.5 cm. long.....5. **L. pilosa**.

1. **Lonicera involucrata** (Richards.) Banks; Spreng. Syst. Veg. 1: 759. 1825.

Xylosteum involucratum Richards. Bot. App. Frankl. Journ. 733. 1823.

Lonicera mociniana DC. Prodr. 4: 336. 1830.

Distegia involucrata Raf. New Fl. N. Amer. 3: 21. 1836.

Mountains of Chihuahua. Western United States, Canada, and Alaska.

Erect shrub, 1 to 3 meters high; leaves short-petiolate, ovate or oval, 5 to 15 cm. long, sparsely pilose and green beneath; corolla yellow; fruit black, about 8 mm. long.

2. *Lonicera mexicana* (H. B. K.) Rehder, Rep. Mo. Bot. Gard. **14**: 65. 1903.
Xylosteum mexicanum H. B. K. Nov. Gen. & Sp. **3**: 332. *pl.* 298. 1818.
Lonicera gibbosa Willd.; Roem. & Schult. Syst. Veg. **5**: 257. 1819.
 Hidalgo and Oaxaca; type from Real del Monte, Hidalgo.
 Erect shrub or tree, 3 to 6 meters high; leaves short-petiolate, oval to oblong-ovate, 4 to 7 cm. long, sparsely pilose beneath; corolla pink, about 2 cm. long.
3. *Lonicera subspicata* Hook. & Arn. Bot. Beechey Voy. 349. 1840.
 Northern Baja California. California.
 Scandent shrub; leaves short-petiolate, oval to narrowly oblong, 1 to 3.5 cm. long, rounded at apex, pubescent or glabrate beneath; spikes short or elongate, the flowers yellowish or pale pink.
4. *Lonicera albiflora* Torr. & Gray, Fl. N. Amer. **2**: 6. 1841.
Lonicera dumosa A. Gray, Pl. Wright. **2**: 66. 1853.
Lonicera albiflora dumosa Rehder, Rep. Mo. Bot. Gard. **14**: 179. 1903.
 Sonora, Chihuahua, and Coahuila. Arizona to Texas.
 Scandent shrub; leaves short-petiolate, oblong-ovate to rounded, 3 to 5 cm. long, acute to rounded at apex, glaucous beneath, glabrous or pubescent; flowers capitate, white or yellowish white.
 The typical form of the species has glabrous leaves. The Mexican plants belong to *L. albiflora dumosa*, in which the leaves are pubescent beneath.
5. *Lonicera pilosa* (H. B. K.) Willd.; H. B. K. Nov. Gen. & Sp. **3**: 427. 1818.
Caprifolium pilosum H. B. K. Nov. Gen. & Sp. **3**: 427. *pl.* 298. 1818.
Lonicera tubulosa Benth. Pl. Hartw. 37. 1839.
 Chihuahua to San Luis Potosí and Mexico.
 Scandent shrub; leaves short-petiolate, oblong to oblong-ovate, 4 to 6 cm. long, acute or obtuse, glaucous beneath, glabrous or pubescent; corolla yellow or purplish.

155. GOODENIACEAE. Goodenia Family.

1. SCAEVOLA L. Mant. Pl. **2**: 145. 1771.

1. *Scaevola plumierii* (L.) Vahl, Symb. Bot. **2**: 36. 1791.

Lobelia plumierii L. Sp. Pl. 929. 1753.

Scaevola lobelia Murr. Syst. Veg. ed. 13. 178. 1774.

On coastal rocks and sands, Yucatán; Clarion Island, Baja California. Florida; West Indies; tropical America.

Fleshy shrub, 1.5 meters high or less; leaves alternate, obovate, 4 to 6 cm. long, short-petiolate, rounded at apex, glabrous; flowers perfect, white, in axillary pedunculate cymes; calyx 5-lobate; ovary inferior; corolla 5-lobate, about 2.5 cm. long, the lobes nearly linear, winged, the tube split along one side; stamens 5, distinct; fruit baccate, oval, 10 to 14 mm. long, black, 2-celled, 2-seeded. "Bosborón," "coralillo" (Porto Rico).

Known in the Bahamas as "inkberry." The plant is said to have sudorific and, in large doses, purgative and emetic properties. It has been employed in the West Indies as a remedy for venereal diseases.

156. LOBELIACEAE. Lobelia Family.

Several other genera are represented in Mexico by herbaceous species.

1. LOBELIA L. Sp. Pl. 929. 1753.

Shrubs, or usually herbs; leaves alternate, entire or dentate; flowers racemose or spicate, often leafy-bracted; calyx tube adnate to the ovary; corolla tube elongate, cleft to the base along one side, the limb 5-lobate, bilabiate; stamens monadelphous, part or all of the anthers with a tuft of hairs at apex; fruit a 2-celled, loculicidally bivalvate capsule.

Numerous herbaceous species occur in Mexico.

- Leaves linear or lance-linear.....1. *L. cavanillesiana*.
 Leaves ovate to oblong-lanceolate.
 Calyx and corolla pubescent.....2. *L. laxiflora*.
 Calyx and corolla glabrous.....3. *L. nelsonii*.

1. *Lobelia cavanillesiana* Roem. & Schult. Syst. Veg. 5: 43. 1819.

Lobelia persicaefolia Cav. Icon. Pl. 5: 12. pl. 518. 1799. Not *L. persicaefolia* Lam. 1789.

Lobelia laxiflora angustifolia DC. Prodr. 7: 383. 1839.

Lobelia nelsonii fragilis Robins. & Fern. Proc. Amer. Acad. 43: 27. 1907.

Baja California to Durango, San Luis Potosí, Puebla, and Michoacán.

Plants herbaceous or suffrutescent; leaves short-petiolate, 7 to 15 cm. long, 3 to 12 mm. wide, long-attenuate, serrate, glabrous or nearly so; racemes very leafy, the flowers on elongate pedicels, pubescent or glabrous; corolla 3 to 3.5 cm. long, red.

2. *Lobelia laxiflora* H. B. K. Nov. Gen. & Sp. 3: 311. 1818.

Lobelia rigidula H. B. K. Nov. Gen. & Sp. 3: 311. 1818.

Siphocampylus bicolor Don in Sweet, Brit. Fl. Gard. II. pl. 389. 1831-38.

Lobelia ovalifolia Hook. & Arn. Bot. Beechey Voy. 301. 1839-40.

Lobelia angulato-dentata Hook. & Arn. Bot. Beechey Voy. 301. 1839-40.

Lobelia concolor Mart. & Gal. Bull. Acad. Brux. 11: 15. 1842.

?*Lobelia regalis* Fernald, Proc. Amer. Acad. 36: 503. 1901.

Sonora to Oaxaca and Veracruz; type collected between Cuajiniquilapa and Acaguisotla, Guerrero. Central America.

Plants herbaceous or suffrutescent, about 1 meter high; leaves sessile or short-petiolate, 6 to 20 cm. long, 1 to 5 cm. wide, acute or acuminate, serrate, usually densely pubescent beneath; racemes very leafy, the flowers borne on elongate pedicels; corolla red, 3 to 4 cm. long. "Zarcillo" (Jalisco); "diente de chucho," "pastoreillo," "diente de perro" (El Salvador).

3. *Lobelia nelsonii* Fernald, Proc. Amer. Acad. 36: 503. 1901.

Type from Huachinango, Jalisco.

Shrub with hard wood; leaves short-petiolate, ovate to lanceolate, 4 to 7 cm. long, 1 to 2.5 cm. wide, acuminate, serrate, sparsely hispidulous; flowers few, at the ends of the branches; corolla red, 2.5 to 3 cm. long.

157. ASTERACEAE. Aster Family.

(Contributed by S. F. Blake; the genera *Ophryosporus* and *Eupatorium* by B. L. Robinson, the genus *Senecio* by J. M. Greenman.¹)

Herbs, shrubs, or trees, sometimes scandent; leaves opposite or alternate, rarely whorled, entire to dissected, never truly compound; flowers collected in a head (this rarely 1-flowered) on a receptacle, surrounded by an involucre of phyllaries (bracts); corolla gamopetalous, regular, tubular, and 5-toothed (rarely 2 to 4-toothed), bilabiate, or ligulate (flattened, strap-shaped, and usually 2 to 5-toothed), rarely wanting in the pistillate flowers; stamens (in the hermaphrodite or staminate flowers) almost always 5, united by the anthers or rarely free, inserted on the corolla; ovary inferior, 1-celled, with an erect anatropous ovule; style usually 2-branched, the branches stigmatiferous inside, often bearing sterile appendages at apex; fruit an achene, with a single erect exalbuminous seed, often bearing a pappus of bristles, awns, or scales.—The corollas are of 4 chief sorts,

¹ The vernacular names and economic notes have been contributed chiefly by Paul C. Standley.

ligulate or strap-shaped, *bilabiate*, *tubular*, and *filiform*. Heads composed of one kind of flowers only are called *homogamous*, those composed of two or more kinds *heterogamous*; when heterogamous, the central flowers (disk) are always hermaphrodite, the peripheral pistillate or neutral (lacking the style). Homogamous heads in which all the flowers are hermaphrodite and have ligulate (in this case always 5-toothed) corollas are called *ligulate*; homogamous heads in which all the corollas are tubular and hermaphrodite or staminate, or filiform and pistillate, are called *discoid*. Heterogamous heads in which the peripheral corollas are ligulate are called *radiate*; those in which the peripheral flowers are pistillate, with tubular, filiform, or abortive corollas are called *disciform*. The receptacle may be naked, bristly, or paleaceous (bearing pales or chaff). The generic characters are drawn to a considerable extent from the character of the pappus, which may be of bristles, awns, scales, or teeth, or reduced to a crown or cup, or entirely wanting.

KEY TO TRIBES.

Anthers caudate at base.

Corollas all bilabiate, or else (*Gochnatia*) the involucre of graduate indurate phyllaries.....**IX. Mutisieae.**

Corollas tubular or filiform; involucre not of indurate phyllaries.....**IV. Inuleae.**
Anthers not caudate at base.

Style branches elongate, acute, hispidulous outside throughout their length.

Heads yellow.....**VIII. Senecioneae.**

Heads white or purplish, never yellow.

Achenes not 4-angled and clavate; pappus not consisting of paleae with a strong midrib.....**I. Vernonieae.**

Achenes 4-angled, clavate; pappus consisting of paleae with a strong midrib.....**VI. Helenieae.**

Style branches otherwise.

Style branches usually elongate, linear or clavate, obtuse, not hispidulous outside or at apex, the stigmatic lines only below the middle and inconspicuous; heads never yellow.....**II. Eupatorieae.**

Style branches, when elongate, hispidulous outside or at apex, the stigmatic lines reaching nearly to apex; heads often yellow.

Phyllaries scarious-margined; heads nodding, small, discoid or disciform; style tips truncate, hispidulous.....**VII. Anthemideae.**

Phyllaries not scarious-margined, or else heads not nodding or style tips acute.

Receptacle paleaceous, at least in the staminate heads, or else leaves chiefly or entirely opposite; pappus not of bristles.....**V. Heliantheae**

Receptacle not paleaceous (rarely bristly), or else leaves alternate.

Pappus present, chiefly or entirely of soft capillary bristles; involucre not glandular-punctate.

Style tips acute.....**III. Astereae**

Style tips truncate or subtruncate.....**VIII. Senecioneae.**

Pappus wanting or of squamellae, awns, or stiff bristles, or else involucre glandular-punctate.

Leaves alternate (opposite in one species of *Aplopappus*).

III. Astereae.

Leaves opposite at least below or else involucre glandular-punctate.

(Exceptions are *Venegasia*, with large triangular-ovate leaf blades; *Clappia*, with densely setose-fimbrillate receptacle; *Psilostrophe*, with papery-persistent ligules; *Chaenactis*, with discoid ochroleucous heads and a pappus of about 13 long paleae).....**VI. Helenieae.**

Tribe I. Vernonieae.

- Pappus double, the outer series short, subpaleaceous or rarely setose, the inner much longer, setose.....1. **VERNONIA.**
 Pappus (in our species) a low entire crown.....2. **OLIGANTHES.**

Tribe II. Eupatorieae.

- Pappus none, or a very short crown.
 Heads 3-flowered (in our species); anthers unappendaged at apex.....3. **PIQUERIA.**
 Heads several to many-flowered; anthers appendaged at apex.
 Achenes compressed.....7. **OAXACANIA.**
 Achenes prismatic, 4 or 5-angled.
 Achenes 4-angled.....6. **JALISCOA.**
 Achenes 5-angled.
 Pappus entirely wanting.....5. **ALOMIA.**
 Pappus a low paleaceous crown.....9. **AGERATUM.**
 Pappus present, better developed.
 Achenes prismatic and 8 to 10-ribbed, or obovoid and not distinctly ribbed.
 Achenes prismatic, 8 to 10-ribbed; receptacle naked.
 Pappus of 4 to 14 linear-attenuate scarious-margined awns; phyllaries few, unequal, subherbaceous.....19. **CARPHOCHAETE.**
 Pappus of numerous bristles; phyllaries usually multiseriate, dry and striate.....20. **COLEOSANTHUS.**
 Achenes obovoid, not distinctly ribbed; receptacle paleaceous.
 21. **DYSCRITOTHAMNUS.**
 Achenes 4 or 5-ribbed (rarely 2 or 3-ribbed).
 Pappus of bristles only.
 Phyllaries 4; heads 4-flowered.....18. **MIKANIA.**
 Phyllaries and flowers more numerous.
 Pappus bristles deciduous.....15. **PIPTOTHRIX.**
 Pappus bristles persistent.
 Anthers without terminal appendage.
 Pappus bristles dilated at tip.....4. **DECACHAETA.**
 Pappus bristles not dilated at tip.....17. **OPHRYOSPORUS.**
 Anthers with terminal appendage.
 Pappus bristles few (5 to 8).....14. **FLEISCHMANNIA.**
 Pappus bristles numerous.....16. **EUPATORIUM.**
 Pappus at least in part of squamellae or awns.
 Phyllaries 5 to 8; uniseriate, subequal.....12. **STEVIA.**
 Phyllaries more numerous.
 Anthers unappendaged at apex; pappus of 5 squamellae prolonged into awns.....11. **AGERATELLA.**
 Anthers appendaged at apex; pappus otherwise.
 Pappus of 2 to 10 bristles and a few squamellae; involucre strongly graduate.
 Squamellae of pappus evident, paleaceous or scarious.
 13. **HOFMEISTERIA.**
 Squamellae of pappus minute, setulose.....14. **FLEISCHMANNIA.**
 Pappus of squamellae only, these sometimes united into a paleaceous crown.
 Involucre strongly graduate; pappus of about 15 membranaceous squamellae.....8. **ASCHENBORNIA.**
 Involucre subequal; pappus of 5 to 10 squamellae, or these united into a crown.

Corollas with short tube and scarcely distinct throat.

9. **AGERATUM.**

Corollas with slender tube, abruptly widened into the throat.

10. **OX YLOBUS.**

Tribe III. *Astereae.*

Plants dioecious or polygamo-dioecious.

Plants dioecious, the heads strictly staminate or pistillate.

29. **BACCHARIS.**

Plants polygamo-dioecious, the staminate heads as in *Baccharis*, the pistillate with 1 to 15 central hermaphrodite flowers.

30. **ARCHIBACCHARIS.**

Plants not dioecious or polygamo-dioecious.

Pappus of squamellae or awns, or wanting.

Pappus wanting.....22. **SELLOA.**

Pappus present.

Pappus of about 10 oblong to lanceolate squamellae; flowers yellow.

23. **GUTIERREZIA.**

Pappus of about 15 to 30 squamellae or awns; flowers white, changing to rose-purple.....26. **GREENELLA.**

Pappus of bristles, sometimes with an outer series of short squamellae.

Flowers all yellow, the rays or disk rarely turning purple in age.

Phyllaries in distinct vertical ranks; heads (in our species) discoid, 5-flowered.....25. **CHRYSOTHAMNUS.**

Phyllaries not in distinct vertical ranks; heads often radiate, usually with more than 5 flowers.

Plants not glaucescent, usually resinous or pubescent.

24. **APLOPAPPUS.**

Plants glaucescent, glabrous, not resinous. Leaves linear, mostly 1 cm. long or less; phyllaries cuspidate-acute or acuminate (*A. carnosus*).....27. **ASTER.**

Flowers (at least those of the ray) white to violet.

Involucre distinctly graduate; style tips acute or acuminate...27. **ASTER.**

Involucre obscurely or not at all graduate; style tips short, obtuse.

28. **ERIGERON.**

Tribe IV. *Inuleae.*

Flowers all hermaphrodite, the corollas tubular; pappus stiff, of about 10 barbellate bristles and about 30 shorter, somewhat connate bristles.

34. **PELUCHA.**

Outer flowers (3 to many) pistillate, with filiform corollas, the inner (1 to many) hermaphrodite, with tubular corollas; pappus 1-seriate, of essentially equal bristles.

Heads few (about 4)-flowered, the hermaphrodite flowers solitary.

32. **ACHYROCLINE.**

Heads many-flowered, the hermaphrodite flowers several or numerous.

Phyllaries dry, but not scarious.....31. **PLUCHEA.**

Phyllaries scarious.....33. **GNAPHALIUM.**

Tribe V. *Heliantheae.*

Plants monoecious. Pistillate involucre gamophyllous, 1 to 8-flowered, the staminate many-flowered.

Pistillate involucre bearing transverse scarious wings...43. **HYMENOCLAEA.**

Pistillate involucre spiny.....44. **FRANSERIA.**

Plants not monoecious.

Heads 1 or 2-flowered, glomerate, the proper involucre gamophyllous, 3 to 6-toothed.

Proper involucre tubular, not winged.....35. **NOCCA**.

Proper involucre at maturity obovoid, 3-winged, corky.

36. **COULTERELLA**.

Heads with more numerous flowers, or if 1 or 2-flowered (62. *Alordia*), then involucre not gamophyllous.

Ray flowers pistillate, fertile; disk flowers hermaphrodite, sterile.

Pistillate corollas tubular; leaves opposite.

Achenes loosely inclosed in sac-shaped phyllaries.

37. **DESMANTHODIUM**.

Achenes not inclosed in sac-shaped phyllaries.

Heads cymose-panicled, not nodding.....38. **CLIBADIUM**.

Heads in racemes or racemiform panicles, nodding.....42. **IVA**.

Pistillate corollas ligulate; leaves opposite or alternate.

Phyllaries subtending the ray achenes indurate, completely enveloping the achenes, with a small terminal orifice...40. **MELAMPODIUM**.

Phyllaries not indurate and completely enveloping the achenes.

Ray achenes obcompressed, their nerviform margins adnate at base to the two opposed involute pales of the outer disk flowers and at maturity separating from the body of the achene nearly to apex, the whole falling together; rays white.

41. **PARTHENIUM**.

Ray achenes not adnate to the opposed pales; rays yellow, orange, or purplish red.

Involucre double, the outer phyllaries few, herbaceous, the inner submembranous.....78. **HIDALGOA**.

Involucre not double.

Achenes all epappose, columnar or columnar-obovoid.

39. **GUARDIOLA**.

Disk achenes pappose, the ray achenes sometimes epappose.

Receptacle elongate-conic, paleaceous throughout; ray achenes with a single awn; disk achenes (infertile) with a pappus of 4 basally connate awns....45. **PHILACTIS**.

Receptacle not elongate-conic, bearing only a single series of paleae (between the rays and the disk flowers); ray achenes epappose; disk achenes (infertile) with a pappus of 6 to 12 awns or squamellae.....85. **HEMIZONIA**.

Ray flowers, when present, pistillate or neutral; disk flowers hermaphrodite, fertile.

Ray corollas sessile, persistent.

Disk achenes strongly compressed.

Leaves sessile; involucre strongly graduate.....46. **ZINNIA**.

Leaves short-petioled; involucre not strongly graduate.

47. **SANVITALIA**.

Disk achenes quadrangular.

Pales straight; pappus wanting or of 2 to 4 minute teeth.

48. **HELIOPSIS**.

Pales usually uncinatate; pappus of 1 or 2 awns, and sometimes 1 or 2 short squamellae.....49. **GRYPOCARPHA**.

Ray corollas with distinct tube and deciduous, or wanting.

Pappus of plumose awns or squamellae.

Achenes somewhat compressed; involucre strongly graduate, about 5-seriate.....83. **BEBBIA**.

- Achenes turbinate; involucre less distinctly graduate... **84. TRIDAX.**
 Pappus (when present) not of plumose awns or squamellae.
- Achenes subcylindric, about 10 or 15-ribbed..... **53. VARILLA.**
 Achenes not subcylindric, fewer-ribbed.
- Achenes contracted into a conspicuous stipitiform base.
 Heads radiate; pappus of 2 awns and several squamellae.
70. PODACHAENIUM.
- Heads discoid; pappus of 2 awns..... **71. ACHAENIPODIUM.**
 Achenes not contracted into a conspicuous stipitiform base.
- Heads 1 to 5-flowered; pappus of 10 to 20 unequal paleaceous
 awns..... **62. ALVORDIA.**
- Heads with more numerous flowers, or else (52. *Montanoa*)
 pappus wanting.
- Involucre distinctly double, the outer phyllaries few, herba-
 ceous, the inner submembranous.
- Disk achenes (sometimes also the ray achenes) surrounded
 and included by the convex pales.
- Heads yellow..... **50. RUMFORDIA.**
 Heads white..... **52. MONTANOA.**
- Disk achenes not surrounded and included by the pales,
 these flat or flattish.
- Inner phyllaries connate about to middle.
79. THELESPERMA.
- Inner phyllaries essentially free.
- Achenes distinctly rostrate..... **81. COSMOS.**
 Achenes not distinctly rostrate.
- Pappus awns antrorse-ciliate or smooth, rarely want-
 ing; achenes obcompressed, usually marginate or
 winged..... **76. COREOPSIS.**
- Pappus awns retrorse-hispid (rarely smooth); achenes
 (in our species) linear or subquadrangular, not
 margined or winged..... **80. BIDENS**
- Involucre not distinctly double.
- Achenes obcompressed..... **77. COREOCARPUS.**
 Achenes not obcompressed.
- Pappus of the disk achenes consisting of 4 to many free,
 usually equal or subequal awns or squamellae.
- Pappus of deciduous setiform awns.
64. PERYMENIUM.
- Pappus of persistent paleaceous awns or squamellae.
- Achenes obovoid, somewhat compressed; phyllaries
 not indurate..... **69. HYMENOSTEPHIUM.**
- Achenes subterete or 4 or 5-angled; phyllaries indu-
 rate (the outer sometimes herbaceous).
- 82. CALEA.**
- Pappus of the disk achenes of 2 or 3 awns, with or without
 squamellae, or a crown of united squamellae, or want-
 ing.
- Achenes strongly compressed, flat or flattish.
- Pappus of 1 or 2 awns, without squamellae, or want-
 ing.
- Achenes winged.
- Pappus awns unequal, the inner broadly winged,
 the outer usually wingless; involucre gradu-
 ate, of indurate, usually subherbaceous-
 tipped phyllaries..... **67. NOTOPTERA.**

Pappus awns usually equal and wingless (with a small wing in *V. robinsonii*, which has a subequal herbaceous involucre).

75. VERBESINA.

Achenes wingless.

Leaves opposite; heads whitish, discoid.

66. SALMEA.

Leaves alternate; heads yellow, usually radiate.

Achenes not very strongly flattened, usually not white-margined; plants strongly resinous.....

65. FLOURENSIA.

Achenes very strongly flattened, narrowly white-margined, villous-ciliate; plants usually not resinous.....

68. ENCELIA.

Pappus of awns and squamellae.

Disk achenes closely enveloped and hidden by the transversely rugose pales. 51. RHYSOLEPIS.

Disk achenes not closely enveloped by the pales, the latter not transversely rugose.

Leaves alternate; plants strongly resinous.

65. FLOURENSIA.

Leaves opposite (alternate in *Zexmenia brevifolia*, which has pistillate rays); plants rarely resinous.

Rays neutral.....

74. OYEDAEA.

Rays pistillate or wanting.

Achenes margined or winged, the wings not decurrent on the awns.

72. ZEXMENIA.

Achenes winged, the wings decurrent on the awns.....

73. OTOPAPPUS.

Achenes thickened.

Rays pistillate.

Pappus of the disk achenes wanting.

Receptacle merely convex; outer phyllaries herbaceous, the inner membranous.

50. RUMFORDIA.

Receptacle conical; phyllaries all similar.

55. ZALUZANIA.

Pappus of the disk achenes present.

Pappus a 4-toothed crown; phyllaries and pales spinescent-tipped.....

56. BORRICHIA.

Pappus a crown of squamellae and usually 2 awns; phyllaries and pales not spinescent-tipped.

Achenes acutely margined or winged.

72. ZEXMENIA.

Achenes not acutely margined or winged.

Leaves opposite; achenes plump, with rounded sides.....

57. WEDELIA.

Leaves alternate; achenes subquadrangular.

58. WYETHIA.

Rays neutral or wanting.

Heads large, 5 to 14 cm. wide, borne on fistulose peduncles.....

60. TITHONIA.

Heads much smaller, or else peduncles not fistulose.
Pappus caducous, of 2 paleaceous awns and
often a few squamellae.

63. HELIANTHUS.

Pappus persistent (of 2 slender deciduous awns
in two species of *Flourensia*) or entirely
wanting.

Heads cylindric; pappus none; involucre
strongly graduate. **54. AGIABAMPOA.**

Heads not cylindric, or else pappus present or
involucre not strongly graduate.

Pales strongly accrescent, including and
greatly surpassing the achenes.

52. MONTANOA.

Pales not strongly accrescent.

Heads discoid; pappus wanting.

55. ZALUZANIA.

Heads radiate, or else pappus present.

Pappus a small cup of united squamel-
lae, sometimes with awns added.

59. ASPILIA.

Pappus of usually free squamellae, with
or without 2 awns, or wanting.

Plants strongly resinous; leaves alter-
nate. **65. FLOURENSIA.**

Plants rarely resinous; leaves oppo-
site, at least below (in *Viguiera*
laciniata alternate and lacini-
ately repand-lobate).

Pappus present.

Pappus of 2 awns and several
squamellae.

61. VIGUIERA.

Pappus of few subequal or un-
equal squamellae.

69. HYMENOSTEPHIUM.

Pappus wanting.

Leaves pinnatilobate, or else
silky-pilose or canescent-
strigillose beneath.

61. VIGUIERA.

Leaves not pinnatilobate, neither
silky-pilose nor canescent-
strigillose beneath.

69. HYMENOSTEPHIUM.

Tribe VI. Helenieae.

Involucre distinctly graduate. Heads radiate, yellow.

Leaves opposite..... **86. JAUMEA.**

Leaves alternate.

Pappus wanting; leaves triangular-ovate..... **87. VENEGASIA.**

Pappus present; leaves linear..... **88. CLAPPIA.**

Involucre equal or subequal (unequal in 95. *Chaenactis*, which has discoid ochro-
leucous heads).

Rays papery-persistent..... **89. PSILOSTROPHE.**

Rays not papery-persistent.

Achenes distinctly compressed, 2-nerved.

Achenes ciliate; pappus of squamellae and usually 1 or 2 awns, rarely wanting..... 90. **PERITYLE**.

Achenes not distinctly ciliate; pappus (in our species) of 1 awn, or wanting. 91. **LAPHAMIA**.

Achenes not distinctly compressed, with more than 2 nerves.

Involucre glandular-punctate or glandular-lined.

Pappus of 5 to 20 paleae, these often aristate-dissected or awned.

99. **DYSSODIA**.

Pappus setose, the setae sometimes reduced to squamellae.

Heads discoid..... 100. **POROPHYLLUM**.

Heads radiate.

Leaves not setose-ciliate; style branches elongate.

101. **CHRYSACTINIA**.

Leaves setose-ciliate; style branches short..... 102. **PECTIS**.

Involucre not glandular-punctate or glandular-lined.

Achenes 10-ribbed; pappus none; heads 2 to 8-flowered, aggregated.

92. **FLAVERIA**.

Achenes not 10-ribbed, usually 4-ribbed; pappus present; heads with more numerous flowers, not aggregated.

Pappus of 4 awns alternating with 4 squamellae..... 93. **EUTETRAS**.

Pappus otherwise.

Heads radiate, yellow.

Phyllaries about 5; heads in small umbelliform cymes or cymose panicles; achenes without substipitiform base.

95. **ERIOPHYLLUM**.

Phyllaries more numerous; heads solitary or cymose-panicled; achenes with substipitiform base..... 97. **BAHIA**.

Heads discoid, white, flesh-color, or ochroleucous.

Pappus oblique, of about 8 paleae, the innermost longest; leaves opposite, broad, crenate or repand.

98. **LOXOTHYSANUS**.

Pappus not oblique; leaves alternate, linear or pinnatilobate.

Pappus of 4 to 6 truncate paleae; leaves linear, entire.

94. **PALAFOXIA**.

Pappus of about 13 acutish paleae; leaves pinnatilobate.

96. **CHAENACTIS**.

Tribe VII. Anthemideae.

A single genus..... 103. **ARTEMISIA**.

Tribe VIII. Senecioneae.

Involucre distinctly graduate.

Leaves opposite, not scalelike..... 104. **LIABUM**.

Leaves alternate, all except the lower scalelike.... 105. **LEPIDOSPARTUM**.

Principal phyllaries equal, sometimes with a series of small bractlets at base.

Phyllaries 4 or 5, broadly oval; leaves opposite..... 106. **HAPLOESTHES**.

Phyllaries more numerous; leaves alternate.

Phyllaries caudate-attenuate, herbaceous above; involucre without bractlets at base; leaves glandular-punctate..... 107. **PEUCEPHYLLUM**.

Phyllaries neither caudate-attenuate nor herbaceous; involucre bracteolate at base; leaves not glandular-punctate..... 108. **SENECIO**.

Tribe IX. Mutisieae.

- Corollas all regular, tubular, 5-lobed.....109. **GOCHNATIA**.
 Corollas all bilabiate.
 Corollas crimson; involucre regularly graduate.....110. **ONOSERIS**.
 Corollas yellow or whitish; involucre not regularly graduate.
 Corollas yellow; involucre double.....111. **TRIXIS**.
 Corollas whitish; involucre nearly 1-seriate.....112. **JUNGIA**.

1. **VERNONIA** Schreb. Gen. Pl. 2: 541. 1791.

REFERENCES: Gleason, Bull. N. Y. Bot. Gard. 4: 164-235. 1906; Gleason, N. Amer. Fl. 33: 50-101. 1922.

Herbs, shrubs, or trees, with alternate leaves and small to large, usually purple heads; involucre cylindric to hemispheric, the phyllaries graduated, dry or indurate, rarely with herbaceous tips; flowers 1 to very numerous, all tubular, hermaphrodite, fertile; receptacle naked; anthers sagittate at base; achenes 4 to 10-ribbed, sometimes with an apical callous border; pappus biseriate, the outer much shorter, subpaleaceous or rarely setose, the inner setose.

The root of *Vernonia nigritiana* Oliver & Hiern of West Africa is said to be employed as a febrifuge, antidysenteric, and emetic, and to resemble somewhat ipecac in its therapeutic properties. It contains a glucoside, vernonin, which is a cardiac poison comparable to digitalin, but less active.

Heads large, the involucre 12 to 20 mm. high.

Phyllaries (at least the outer) with ovate or lanceolate to deltoid, herbaceous, spreading or reflexed tips.

Leaves green and merely pilose-strigose beneath.....1. **V. salvinae**.

Leaves grayish-tomentose beneath.

Phyllaries glabrous.....2. **V. mexicana**.

Outer phyllaries densely pubescent.....3. **V. callilepis**.

Phyllaries without spreading herbaceous tips.

Heads subsessile, in close clusters; phyllaries narrowly lanceolate to linear-lanceolate, acuminate, obscurely cuspidate; leaves canescent-tomentose beneath.....4. **V. arctioides**.

Heads pedunculate, not in close clusters; phyllaries oblong, truncate or rounded, abruptly mucronate; leaves green or griseous-tomentose beneath.

Leaves acute at base.....5. **V. alamani**.

Leaves rounded at base.....6. **V. dictyophlebia**.

Heads smaller, the involucre 8 (rarely 10) mm. high or less.

Inflorescence of scorpioid cymes, the heads mostly sessile.

Heads subtended by leafy bracts; involucre 1 cm. high...7. **V. schiedeana**.

Heads not leafy-bracted; involucre 5 mm. high or less.

Heads 11-flowered.....8. **V. aschenborniana**.

Heads 18 to 21-flowered.

Leaves tomentulose or tomentose beneath.

Pappus tawny; achenes pubescent, not glandular...9. **V. deppeana**.

Pappus white or whitish; achenes pubescent and glandular.

10. **V. morelana**.

Leaves puberulous to silky-pilose but not tomentose beneath.

Pappus brownish; phyllaries obtuse or acutish.....11. **V. patens**.

Pappus white; phyllaries acute or acuminate...12. **V. canescens**.

Inflorescence of corymbiform or paniculate clusters, the heads mostly pedicellate.

Heads about 22-flowered; involucre 9 to 10 mm. high...13. **V. karvinskiana**.

Heads 1 to 11-flowered; involucre 3 to 7 mm. high.

Heads 7 to 11-flowered; inner phyllaries not deciduous (except in no. 17).

Leaves floccose-tomentose beneath.....14. *V. oaxacana*.

Leaves not floccose-tomentose beneath.

Leaves scabrous-pubescent on the veins beneath.

15. *V. capreaefolia*.

Leaves puberulent or sordid-pilosulous beneath.

Leaves 1.5 to 2 cm. wide; phyllaries purple-tipped.

16. *V. liatroides*

Leaves 3.2 to 5.7 cm. wide; phyllaries whitish...17. *V. littoralis*.

Heads 1 to 5-flowered; inner phyllaries deciduous.

Heads 1 or 2-flowered.

Phyllaries (at least the middle and outer) distinctly mucronate.

Leaves chiefly oval or obovate; mucros of the middle and outer phyllaries about 0.2 mm. long.....18. *V. mucronata*.

Leaves chiefly broadly ovate; mucros of the middle and outer phyllaries about 0.5 mm. long.....19. *V. aristifera*.

Phyllaries not mucronate, sometimes apiculate.

Leaves densely canescent or cinereous-tomentose beneath.

Leaves broadly ovate or oblong-ovate, rounded or cordate at base, 2 to 7 cm. wide.....20. *V. monosis*.

Leaves elliptic-oblong or oval-oblong, cuneate at base, 1.5 to 4 cm. wide.

Inner phyllaries acute or acuminate.

21. *V. tarchonanthifolia*.

Inner phyllaries obtuse or rounded.....22. *V. obtusa*.

Leaves not densely tomentose beneath.

Leaves oval-ovate or broadly ovate, 3 to 4 cm. wide.

23. *V. steetzii*.

Leaves elliptic, 2.5 cm. wide or less.

Leaves tufted in the axils of the veins beneath; phyllaries usually tomentose at apex.....24. *V. salicifolia*.

Leaves not tufted in the axils of the veins beneath; phyllaries not tomentose at apex.....25. *V. pallens*.

Heads 3 to 5-flowered.

Leaves very densely tomentose over whole surface beneath.

Phyllaries densely tomentose; achenes glabrous.

Achenes whitish or light brown.....26. *V. leiocarpa*.

Achenes dark brown or purplish brown...27. *V. melanocarpa*.

Phyllaries not densely tomentose; achenes pubescent.

Leaves ovate, less than twice as long as wide.

28. *V. durangensis*.

Leaves elliptic to oval-lanceolate, more than twice as long as wide.

Leaves 6.5 to 7.3 cm. long, less than three times as long as wide.

29. *V. oolepis*.

Leaves 7 to 19 cm. long, more than three times as long as wide.

30. *V. palmeri*.

Leaves not densely tomentose over whole surface beneath.

Leaves densely pilosulous at least along the costa beneath.

Leaves elliptic or oblong-elliptic; phyllaries obtuse to acutish, not apiculate.....30. *V. palmeri*.

Leaves oval; phyllaries acute, mostly apiculate.

31. *V. barbinervis*.

Leaves not densely pilosulous along the costa beneath.

Leaves elliptic or oblong-elliptic, 1.5 to 3 cm. wide; achenes pubescent.....32. *V. triflosculosa*.

Leaves ovate or elliptic, 4.5 to 6 cm. wide; achenes glabrous or glandular.....33. *V. heydeana*.

1. *Vernonia salvinae* Hemsl. Biol. Centr. Amer. Bot. 2: 73. pl. 41. 1881.

Leiboldia salvinae Gleason, Bull. N. Y. Bot. Gard. 4: 162. 1906.

Chiapas. Guatemala; type from Las Nubes, Cerro de Zunil.

Shrubby (?); branchlets lanate or tomentose, glabrescent; petioles 1 to 4 cm. long; leaf blades obovate or oblanceolate, 10 to 20 cm. long, 4 to 7.5 cm. wide, acuminate, serrulate or serrate; heads few, on peduncles 1 to 6.5 cm. long; involucre 13 to 18 mm. high, the phyllaries with indurate base and broader, ovate or deltoid, spreading, herbaceous apex, puberulent or glabrate; heads violet-purple, 3 to 5 cm. wide; pappus tawny.

2. *Vernonia mexicana* Less. Linnaea 6: 680. 1831.

Leiboldia mexicana Gleason, Bull. N. Y. Bot. Gard. 4: 163. 1906.

Veraacruz; type from Cuesta Grande de Chiconquiaco.

Shrub; branches cinereous-tomentose; leaf blades obovate, 20 cm. long, short-acuminate, thinly gray-tomentose beneath; involucre 2 cm. high, 3 cm. wide, the phyllaries glabrous, the outer with spreading rounded herbaceous tips. (Description compiled.)

3. *Vernonia callilepis* Gleason, N. Amer. Fl. 33: 81. 1922.

Known only from the type locality, La Liberia, Michoacán or Guerrero.

Shrubby, 1.5 meters high; stem densely griseous-pilose; leaves short-petioled, the blades elliptic or oval, 14 to 21 cm. long, 5.5 to 7.5 cm. wide, acute at both ends, serrate, griseous-pilose beneath; heads few, 2.5 cm. high, the pedicels 5 cm. long; involucre 2 cm. high, the outer phyllaries linear-lanceolate, foliaceous, acuminate, spreading, the inner with rounded, membranous purple tips; pappus brownish.

4. *Vernonia arctioides* Less. Linnaea 6: 400. 1831.

Diazeuxis ? *serrata* D. Don, Trans. Linn. Soc. 16: 254. 1830. Not *V. serrata* Less. 1829.

Vernonia leiboldiana Schlecht. Linnaea 19: 742. 1847.

Leiboldia ovata Schlecht. Linnaea 19: 742. 1847, as synonym.

Leiboldia arctioides Schlecht. Linnaea 19: 743. 1847, as synonym.

Leiboldia leiboldiana Gleason, Bull. N. Y. Bot. Gard. 4: 163. 1906.

Leiboldia serrata Gleason, Bull. N. Y. Bot. Gard. 4: 164. 1906.

Veraacruz and Puebla; type from Cuesta Grande de Chiconquiaco.

Suffrutescent, 1 to 2 meters high, the stout angled stem cinereous-tomentose; petioles about 5 mm. long; leaf blades obovate, 11 to 24 cm. long, 5 to 12 cm. wide, acute, sharply serrate; heads few, in close clusters; involucre 12 to 18 mm. high, the phyllaries lanceolate to linear-lanceolate, acuminate, cuspidate, densely tomentose or glabrescent; flowers purple; pappus white.

5. *Vernonia alamani* DC. Prodr. 5: 61. 1836.

Morelos to Oaxaca; type from Mexico, without definite locality.

Suffrutescent (?), 1 to 2 meters high; stem densely cinereous-puberulous; leaf blades elliptic-lanceolate to elliptic-oblong, 9 to 14 cm. long, 2 to 7 cm. wide, tapering to each end, subentire, tomentose-puberulous on the veins beneath and gland-dotted; involucre 15 to 20 mm. high, glabrous, the phyllaries bearing mucros 2 to 4 mm. long.

6. *Vernonia dictyophlebia* Gleason, Bull. N. Y. Bot. Gard. 4: 203. 1906.

Guanajuato to Oaxaca; type from Pátzcuaro, Michoacán.

Suffrutescent (?), 1 to 2 meters high; stem tomentellous; leaves oval or ovate, 6 to 10 cm. long, 3 to 6 cm. wide, acute, prominulous-reticulate and griseous-tomentellous beneath; heads several or numerous, on peduncles 1 to 4 cm. long; mucros of the phyllaries shorter than in the last species.

7. *Vernonia schiedeana* Less. Linnaea 6: 399. 1831.

?*Vernonia fragrans* Llave in Llave & Lex. Nov. Veg. Deser. 1: 24. 1824.

Veraeruz and Tabasco; type from Panantla and Misantla, Veracruz. Honduras and El Salvador.

Scandent, shrubby, 3 meters high; stem puberulous; leaves oval to elliptic, 8 to 15 cm. long, 2 to 5 cm. wide, short-petioled, puberulous or pubescent above chiefly along costa, puberulous to densely pilosulous beneath; involucre 1 cm. high, the outer phyllaries lanceolate, acuminate or mucronate, stiff, the inner linear-oblong, with loose rounded ampliate brownish tips; heads about 26-flowered; pappus whitish. "Flor de borla" (Veracruz); "aroma" (El Salvador).

8. *Vernonia aschenborniana* Schauer, Linnaea 19: 714. 1847.

San Luis Potosí to Nicaragua; type from Mexico, without definite locality.

Shrubby, 2 to 5 meters high; stem sordidly puberulous or pilosulous; leaves elliptic to oblong-ovate, 5 to 10 cm. long, 1 to 3 cm. wide, scabridulous above, usually densely sordid-puberulous or pilosulous beneath; involucre 3 mm. high, its phyllaries ovate or oval, acute or acutish, greenish, with thickish tips, the thin narrow pale margins arachnoid-ciliate; pappus becoming tawny. "Suquinay" (Honduras).

The plant is used medicinally.

9. *Vernonia deppeana* Less. Linnaea 6: 398. 1831.

?*Vernonia stellaris* Llave in Llave & Lex. Nov. Veg. Deser. 1: 23. 1824.

Veraeruz to Costa Rica; type from Misantla, Veracruz.

Shrubby, up to 6 meters high; stem tomentulose; leaves oblong to oval, 8 to 15 cm. long, 2 to 6 cm. wide, densely cinereous or sordid-tomentulose beneath; involucre 3.5 mm. high, similar to that of *V. aschenborniana*. "Suquinay" (El Salvador, Guatemala); "tute" (Costa Rica); "semem" (Guatemala); "cihuapatli," "zi-tit," "flor de cuaresma" (Chiapas, *Seler*); "rájate-luego" (El Salvador).

10. *Vernonia morelana* Gleason, Bull. Torrey Club 46: 241. 1919.

Known only from the type locality, Cuernavaca, Morelos.

Shrub 3 to 5 meters high; stem gray-tomentose; leaves ovate-oblong, 7.5 cm. long, 3 cm. wide, scabrous above, finely gray-tomentose beneath; involucre 4 to 4.5 mm. high, the phyllaries ovate to lanceolate, acute or cuspidate, tomentose-ciliate and somewhat puberulous; achenes thinly pubescent and densely glandular; pappus white or very pale tawny.

11. *Vernonia patens* H. B. K. Nov. Gen. & Sp. 4: 41. 1820.

?*Vernonia lanceolaris* DC. Prodr. 5: 37. 1836.

Michoacán (or Guerrero) to Panama and northern South America; type from Middle America.

Shrubby, 8 meters high or less; stem tomentulose-puberulous; leaves elliptic to oblong-elliptic, 5 to 13 cm. long, 1.5 to 4 cm. wide, smooth to the touch above, puberulous, especially on the veins, beneath; panicles large; involucre 4 mm. high, the phyllaries obtuse or acutish, mostly mucronulate; flowers white. "Tute" (Costa Rica); "pie de zope," "suquinayo," "suquinay," "palo blanco" (El Salvador).

12. Vernonia canescens H. B. K. Nov. Gen. & Sp. 4: 35. pl. 317. 1820.*Vernonia purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 197. 1915.

Puebla and Guerrero (or Michoacán) to South America; type from Guanacabamba, Peru.

Suffrutescent, 1.3 meters high or less; stem puberulous or tomentose-pilosulous; leaves chiefly ovate or oval-ovate, 6 to 12 cm. long, 2 to 5 cm. wide, sparsely or usually densely pilosulous or silky-pilose beneath; involucre 3.5 to 5 mm. high, the phyllaries all lanceolate or linear-lanceolate, acute or usually acuminate; flowers deep rosy or purplish. "Hierba de San Juan" (Panama); "tuete" (Costa Rica); "ciguapate" (El Salvador).

13. Vernonia karvinskiana DC. Prodr. 5: 62. 1836.

Oaxaca.

Suffrutescent, 1 meter high; stem purplish, glabrous to sparsely puberulous; leaf blades elliptic to oblong or ovate-elliptic, 3 to 10 cm. long, 1.5 to 3 cm. wide, scabrous above, pubescent or puberulous beneath chiefly along the venation; heads umbellate-cymose; involucre purplish, the outer phyllaries subulate, appressed, the inner lanceolate, mucronulate, with rather loose tips; achenes gland-dotted.

14. Vernonia oaxacana Schultz Bip.; Klatt, Leopoldina 20: 74. 1884.

Oaxaca and Chiapas; type from San Carlos.

Shrubby; leaves elliptic-oblong, 10 cm. long, 3 cm. wide, scabrellate above, floccose beneath; inflorescence hemispheric; heads crowded; involucre 5 mm. high; phyllaries ovate-lanceolate to narrowly oblong, glabrous, acute, cuspidate.

15. Vernonia capreaefolia Gleason, Bull. N. Y. Bot. Gard. 4: 200. 1906.*Vernonia ehrenbergiana capreaefolia* Schultz Bip.; Gleason, Bull. N. Y. Bot. Gard. 4: 200. 1906, as synonym.

Jalisco to Veracruz and Oaxaca; type from Orizaba, Veracruz.

"Suffrutescent," erect, 1 meter high, puberulent or glabrate; leaves broadly elliptic, 9 to 13 cm. long, 2.5 to 5 cm. wide, acute, coarsely serrate, very scabrous above, nearly glabrous beneath except along the prominent veins; involucre 5 mm. high; phyllaries ciliate, the outer lanceolate, cuspidate, the inner ovate-oblong or oblong, acute or mucronulate; pappus nearly white.

16. Vernonia liatroides DC. Prodr. 5: 34. 1836.*Eupatorium tulanum* Klatt, Abh. Naturf. Ges. Halle 15: 324. 1882.

Tamaulipas to Veracruz; western Mexico; type collected between Tula, Hidalgo, and Tampico, Tamaulipas.

Herbaceous or suffrutescent; stem puberulent; leaves elliptic-oblong or oblong-lanceolate, 5 to 8 cm. long, 1.5 to 2 cm. wide, serrate, scabrellate above, ferruginous-puberulous beneath; heads in rounded subumbellate cymes; involucre 3 to 4 mm. high; phyllaries lanceolate or oblong-lanceolate, nearly glabrous, cuspidate; pappus flavescent. "Tlamalacatilacotli" (Morelos, Seler).

17. Vernonia littoralis T. S. Brandeg. Erythraea 7: 3. 1899.*Eremosis littoralis* Gleason, N. Amer. Fl. 33: 100. 1922.

Known only from the type locality, Socorro Island.

Shrubby; stem sordid-puberulous; petioles 7 to 17 mm. long; blades broadly ovate or oval-ovate, 6 to 9 cm. long, 3.2 to 5.7 cm. wide, serrulate, above smooth, subglabrate, beneath sordid-pilosulous with crisped hairs especially along the venation; heads 7 or 8-flowered, in rounded corymbiform panicles; involucre 6 mm. high, whitish, the phyllaries ovate to (inner) linear-oblong, acutish to obtuse, ciliate, the inner deciduous; achenes whitish, glabrous or sparsely puberulous.

18. Vernonia mucronata Blake, Contr. Gray Herb. n. ser. 52: 19. 1917.*Monosis foliosa* Benth. Pl. Hartw. 19. 1839.*Vernonia foliosa* Schultz Bip. Pollichia 18-19: 161. 1861. Not *V. foliosa* Gardn. 1846.*Eremosis foliosa* Gleason, Bull. N. Y. Bot. Gard. 4: 228. 1906, as to synonym. San Luis Potosí and Jalisco; type from Bolaños, Jalisco.

Low shrub, cinereous-tomentose, glabrescent; leaf blades oval-ovate or ovate, 4 to 6.5 cm. long, 2 to 3.3 cm. wide, thin-coriaceous, entire or sparsely denticulate, closely cinereous-tomentose on both sides, glabrescent above, becoming merely tomentulose-puberulous beneath; involucre 5 to 6 mm. high, purplish, the phyllaries acute to acuminate, the middle and outer with short mucros; achenes densely villous.

19. Vernonia aristifera Blake, sp. nov.? *Vernonia steetzii callilepis* Schultz Bip. in Seem. Bot. Voy. Herald 297. 1856.*Eremosis foliosa* Gleason, Bull. N. Y. Bot. Gard. 4: 228. 1906, as to description.*Eremosis callilepis* Gleason, N. Amer. Fl. 33: 98. 1922, at least as to description. Not *V. callilepis* Gleason, 1922.

Jalisco; type collected at Río Blanco (*Palmer* 678 in 1886; U. S. Nat. Herb. no. 49992).

Similar to *V. mucronata*; leaves mostly broadly ovate, 3.5 to 6 cm. long, 2.2 to 4.5 cm. wide, densely and persistently cinereous-tomentose beneath, glabrescent above; phyllaries more acuminate than in *V. mucronata* and with longer mucros.

20. Vernonia monosis Schultz Bip. Linnaea 20: 507. 1847.*Turpinia* ? *tomentosa* Lex. in Llave & Lex. Nov. Veg. Descrip. 1: 24. 1824Not *Vernonia tomentosa* Ell. 1822.? *Vernonia paniculata* DC. Prodr. 5: 23. 1836.*Monosis tomentosa* DC. Prodr. 5: 77. 1836.*Eremosis tomentosa* Gleason, Bull. N. Y. Bot. Gard. 4: 229. 1906.

Jalisco to Querétaro; type from Mt. Quinceo, near Morelia.

Shrubby, up to 2.5 meters high, densely cinereous-tomentose; leaf blades 8 to 12.5 cm. long, glabrescent above, densely cinereous-tomentose beneath with loose tomentum; panicles very large; involucre purplish, 5 mm. high, tomentose at base, the phyllaries acute or acuminate; achenes densely appressed-pubescent.

21. Vernonia tarchonanthifolia (DC.) Schultz Bip. Linnaea 20: 507. 1847.*Monosis tarchonanthifolia* DC. Prodr. 5: 77. 1836.*Oliganthes karwinskii* Schultz Bip. Linnaea 20: 505. 1847.*Eremosis tarchonanthifolia* Gleason, Bull. N. Y. Bot. Gard. 4: 230. 1906.

Oaxaca.

Shrub 3 to 6 meters high; stem densely cinereous-tomentose; leaf blades 6 to 9 cm. long, green and glabrescent above, densely cinereous-tomentose beneath; involucre purplish, 6 mm. high; achenes gland-dotted and rather sparsely hispidulous.

22. Vernonia obtusa (Gleason) Blake.*Eremosis obtusa* Gleason, N. Amer. Fl. 33: 99. 1922.

Known only from the type locality, Minas de San Rafael, San Luis Potosí.

Shrub; stem cinereous-tomentose, glabrescent; leaves petioled, the blades oval-oblong, 5 to 7 cm. long, 2 to 3.5 cm. wide, acute, cuneate at base, entire or denticulate, densely and loosely griseous-tomentose beneath; involucre 6 mm. high, the phyllaries brown or purple, the outer ovate, obtuse or rounded, tomentose, the middle and inner obtuse or rounded, ciliate, glandular above; achenes glandular, otherwise essentially glabrous.

23. *Vernonia steetzii* Schultz Bip. in Seem. Bot. Voy. Herald 297. 1856.*Eremosis steetzii* Gleason, Bull. N. Y. Bot. Gard. 4: 230. 1906.

Chihuahua; type from the Sierra Madre of northwestern Mexico.

Shrubby, sordid-puberulous; petioles 2 to 6 mm. long; leaf blades 5 to 10 cm. long, 3 to 5.5 cm. wide, scabridulous above, hispidulous on the venation beneath; involucre brownish white or slightly purplish-tinged, essentially glabrous; achenes densely appressed-pilose.

24. *Vernonia salicifolia* (DC.) Schultz Bip. Linnaea 20: 507. 1847.*Monosis salicifolia* DC. Prodr. 5: 77. 1836.*Vernonia uniflora* Schultz Bip. Linnaea 20: 506. 1847.*Eremosis salicifolia* Gleason, Bull. N. Y. Bot. Gard. 4: 231. 1906.

Puebla to Oaxaca; type from near "Guchinapa" and Cuernavaca.

Stem tomentulose or tomentose; leaf blades elliptic or narrowly oblong-elliptic, 4 to 8.5 cm. long, 1 to 2 cm. wide, densely gland-dotted on both sides, loosely arachnoid-pilose, glabrescent; involucre purplish; achenes densely appressed-pilose. "Ahuitule" (*Urbina*).

25. *Vernonia pallens* Schultz Bip. Pollichia 18-19: 161. 1861.*Eremosis pallens* Gleason, Bull. N. Y. Bot. Gard. 4: 228. 1906.*Eremosis leiophylla* Gleason, Bull. N. Y. Bot. Gard. 4: 231. 1906.*Vernonia leiophylla* Blake, Contr. Gray Herb. n. ser. 52: 18. 1917.

Morelos and Michoacán or Guerrero; type from Mexico, without definite locality.

Shrubby, 3 to 5 meters high, the branches glabrate; petioles 3 to 4 mm. long; leaf blades lanceolate to elliptic, 4 to 8.5 cm. long, 1.1 to 2.5 cm. wide, acute, entire or obscurely serrulate, glabrous or nearly so on both sides; phyllaries whitish, brownish, or purplish, acute, ciliate; achenes sparsely short-villous.

26. *Vernonia leiocarpa* DC. Prodr. 5: 34. 1836.*Eremosis leiocarpa* Gleason, Bull. N. Y. Bot. Gard. 4: 232. 1906.

"Southern Mexico"; type from Mexico, without definite locality. Guatemala.

Shrubby, densely sordid or cinereous-tomentose; petioles about 1.5 cm. long; leaf blades elliptic-oblong or elliptic-ovate, 8 to 14 cm. long, 2 to 6 cm. wide, greenish or grayish above, densely and softly cinereous or sordid-tomentose beneath; phyllaries densely sordid-tomentose on their exposed portions. "Palito de negro" (Guatemala); "palo de asma" (El Salvador).

Employed in El Salvador as a remedy for asthma.

27. *Vernonia melanocarpa* (Gleason) Blake, Contr. Gray Herb. n. ser. 52: 18. 1917.*Eremosis melanocarpa* Gleason, Bull. N. Y. Bot. Gard. 4: 232. 1906.

Veracruz to Guatemala; type from Chupadera, Guatemala.

Stem densely puberulous, subglabrate; petioles 1.4 to 2.2 cm. long; leaf blades oval or elliptic-ovate, 6 to 10.5 cm. long, 2.2 to 5 cm. wide; phyllaries colorate only at apex, sordid-pilose at base and apex and on margin.

28. *Vernonia durangensis* Blake, Contr. U. S. Nat. Herb. 22: 587. 1924.*Eremosis ovata* Gleason, Bull. Torrey Club 40: 331. 1913. Not *V. ovata* Less. 1829.*Vernonia gleasoni* Blake, Contr. Gray Herb. n. ser. 52: 17. 1917. Not *V. gleasonii* Ekman, 1914.

Known only from the type locality, San Ramón, Durango.

Shrubby, the stem tomentulose; petioles about 1.2 cm. long; leaf blades ovate or elliptic-ovate, 6.8 to 9 cm. long, 3.5 to 5 cm. wide, densely canescent-tomentose beneath, the veins about 10 pairs, prominent beneath; heads (3 or) 4-flowered, forming a broad panicle; involucre 5.5 mm. high, the phyllaries tomentulose at apex; achenes pilose.

29. *Vernonia oolepis* Blake, Contr. Gray Herb. n. ser. 52: 20. 1917.

Eremosis oolepis Gleason, N. Amer. Fl. 33: 97. 1922.

Yucatán; type from Izamal.

Shrub, the stem densely pilose-tomentose, subglabrate; petioles 2 to 4 mm. long; leaf blades oval-lanceolate or obovate-lanceolate, about 7 cm. long, 2.8 cm. wide, acuminate at each end, glabrous above, densely and sordidly pilose-tomentose beneath, the veins about 5 pairs, obscure; heads sessile, 4-flowered; involucre 5.5 mm. high, the phyllaries pale, rounded at apex, ciliate; achenes sparsely pilosulous, blackish brown.

30. *Vernonia palmeri* Rose, Contr. U. S. Nat. Herb. 1: 101. 1891.

Eremosis palmeri Gleason, Bull. N. Y. Bot. Gard. 4: 233. 1906.

Vernonia chacalana Blake, Contr. Gray Herb. n. ser. 52: 19. 1917.

Sonora to Durango and Tepic; type from Alamos, Sonora.

Shrub 5 meters high or less, the stem densely cinereous-tomentulose; petioles 3 to 18 mm. long; blades elliptic, elliptic-oblong, or oblong-lanceolate, 6 to 18 cm. long, 1.5 to 5.5 cm. wide, remotely serrulate, beneath densely griseous-tomentulose or pilosulous, or sometimes glabrescent except along the veins; heads 3 (rarely 4 or 5)-flowered; involucre whitish or sometimes purplish-tinged, the phyllaries more or less ciliate; achenes pubescent. "Tacotillo" (Sinaloa).

31. *Vernonia barbinervis* Schultz Bip. in Seem. Bot. Voy. Herald 297. 1856.

Eremosis barbinervis Gleason, Bull. N. Y. Bot. Gard. 4: 232. 1906.

Sinaloa; type from the Sierra Madre of northwestern Mexico.

Shrubby, about 3 meters high, the stem subglabrous; petioles 1 to 1.5 cm. long, obscurely puberulous; leaf blades oval, 8 to 12 cm. long, 4 to 5 cm. wide, rounded to subacute, cuneate at base, subglabrous above, densely pubescent along costa beneath, at least when young, and tufted in the axils of the veins; heads 3-flowered; involucre whitish or brownish-tinged, the phyllaries broadly ovate to oblong-ovate or oblong, acute and often apiculate. "Tacotillo" (Sinaloa).

32. *Vernonia triflosculosa* H. B. K. Nov. Gen. & Sp. 4: 40. 1820.

Gymnanthemum congestum Cass. Diet. Sci. Nat. 20: 110. 1821.

Vernonia triantha Schauer, Linnaea 19: 714. 1847.

Vernonia luxensis Coulter, Bot. Gaz. 20: 41. 1895.

Vernonia dumeta Klatt, "Leopoldina Bot. Beibl. 1. 1895."

Colima to Costa Rica; type collected near Acaguisotla, Guerrero.

Shrubby or arborescent, the stem cinereous-tomentulose, glabrescent; petioles 5 to 10 mm. long; leaf blades elliptic or oblanceolate, 5.5 to 12 cm. long, 1.3 to 3 cm. wide, subglabrous above, subglabrous to thinly tomentulose beneath; heads 3-flowered; involucre whitish, 5 mm. high, the phyllaries rotund-ovate to oblong, obtuse to (inner) acuminate, ciliate or ciliolate; achenes pubescent. "Tubusl" (Costa Rica); "rájate luego," "sauquillo," "suquinay prieto," "barreto" (El Salvador).

33. *Vernonia heydeana* Coulter, Bot. Gaz. 20: 42. 1895.

Eremosis heydeana Gleason, Bull. N. Y. Bot. Gard. 4: 234. 1906.

Southern Mexico. Guatemala; type from San Miguel Uspantán, Department of Quiché.

Shrubby, the stem puberulent or glabrate; leaves elliptic or ovate, 8 to 10 cm. long, 4.5 to 6 cm. wide, acute at each end, sparsely pubescent above, thinly tomentose beneath or glabrescent; involucre 6 mm. high, the phyllaries ovate to oblong-ovate, obtuse, ciliate; achenes glabrous or minutely glandular.

DOUBTFUL SPECIES.

VERNONIA HYPOLEUCA DC. Prodr. 5: 27. 1836. Probably not a *Vernonia*.

VERNONIA PURPURASCENS Schultz Bip.; Walp. Rep. 2: 945. 1843. *Eremosis purpurascens* Gleason, Bull. N. Y. Bot. Gard. 4: 233. 1906. This species has been referred by Gleason¹ to the synonymy of *Eremosis tomentosa* (= *Vernonia monosis*), but the heads are described as 3-flowered, while they are 1-flowered in that species.

2. **OLIGANTHES** Cass. Bull. Soc. Philom. Paris (1817: 10. 1817, hyponym;)
1818: 58. 1818.

REFERENCE: Gleason, Bull. N. Y. Bot. Gard. 4: 235. 1906.

1. *Oliganthes oxylepis* Benth.; Benth. & Hook. Gen. Pl. 2: 233. 1873.

Known only from the type locality, Yucatán or Tabasco.

Suffrutescent (?), "0.5 to 0.6 meters high;" stem tomentose; leaf blades rhombic, 8 to 11 cm. long, 3 to 4.5 cm. wide, acute at each end, crenate-dentate, short-petioled, quickly glabrate and green above, densely ochroleucous-tomentose beneath; heads 8 or 9-flowered, sessile or subsessile in small clusters at tips of branches; involucre 9 to 10 mm. high, about 6-seriate, graduate, the phyllaries dry, lanceolate, glabrous, cuspidate-attenuate, erect or slightly spreading at tip; achenes turbinate, 7 or 8-ribbed, glabrous; pappus a low entire crown.

3. **PIQUERIA** Cav. Icon. Pl. 3: 18. pl. 235. 1795.

REFERENCE: Robinson, Revision of the genus *Piqueria*, Proc. Amer. Acad. 42: 4-16. 1906.

The genus was named for A. Piquer, a Spanish physician of the eighteenth century. *Piqueria trinervia* Cav., a widespread herbaceous species of Mexico, is grown frequently in greenhouses for its handsome fragrant white flowers. The following vernacular names are reported for this species: "Hierba del tabardillo" (Puebla, Jalisco); "hierba de San Nicolás," "yoloxiltic," "xoxonitzal" (Hidalgo); "tabardillo" (Zacatecas). An infusion of the leaves is employed locally as a remedy for typhoid fever.

1. *Piqueria serrata* A. Gray, Proc. Amer. Acad. 15: 25. 1880.

San Luis Potosí; type from Álvarez Mountains.

Shrubby; stem obscurely bifarious-puberulous; leaves opposite, short-petioled, the blades ovate-oblong, 7 to 9 cm. long, 2.5 to 4 cm. wide, acuminate, abruptly narrowed at base, coarsely and sharply serrate; heads small, numerous in small rounded cymose panicles, 3-flowered; phyllaries elliptic-ovate, 3-nerved, rounded, mucronate, crose-ciliate; flowers white; achenes 5-angled, glabrous, with a deciduous annulus.

1a. *Piqueria serrata angustifolia* Robins. & Greenm. Amer. Journ. Sci. III. 50: 151. 1895.

Known only from the type locality, Sierra de San Felipe, Oaxaca.

Leaves lanceolate, obscurely crenate-serrate.

4. **DECACHAETA** DC. Prodr. 5: 133. 1836.

1. *Decachaeta haenkeana* DC. Prodr. 5: 133. 1836.

Sinaloa to southern Mexico; type from Mexico, without definite locality.

Suffrutescent, erect; leaves alternate, the blades oblong or obovate-oblong, 8.5 to 25 cm. long, 2.3 to 5 cm. wide, serrate, reticulate, short-petioled, puberulous beneath; heads numerous, sessile and clustered on short peduncles in thyrsoid panicles on axillary branches; heads 7 mm. high; involucre graduated, the phyllaries dry, scariosus-margined; flowers whitish; achenes black, 5-angled; pappus bristles 10 to 15 in a single series, hispidulous, slightly dilated at tip.

¹ N. Amer. Fl. 33: 100. 1922.

5. **ALOMIA** H. B. K. Nov. Gen. & Sp. 4: 151. pl. 354. 1820.

REFERENCE: Robinson, Revision of the genus *Alomia*, Proc. Amer. Acad. 49: 438-454. 1913.

1. **Alomia isocarphoides** (DC.) Robinson, Proc. Amer. Acad. 49: 449. 1913.

Ageratum isocarphoides Hemsl. Biol. Centr. Amer. Bot. 2: 82. 1881.

Carelia isocarphoides Kuntze, Rev. Gen. Pl. 1: 325. 1891.

Type from Mexico, without definite locality; doubtfully recorded from Veracruz.

Suffruticose, hispid-pubescent; leaves opposite, the blades lanceolate, acuminate, subsessile, 3-nerved, scabrous above, velvety-villous beneath; heads about 25-flowered, corymbose; pappus none. (Description compiled.)

A doubtful species.

6. **JALISCOA** S. Wats. Proc. Amer. Acad. 25: 153. 1890.

Suffrutescent; leaves opposite or ternate, ovate, thin, slender-petioled, triplinerved; heads small, in dense corymbiform panicles terminating stem and branches; involucre 2-seriate, equal, dryish; receptacle paleaceous; flowers white; achene 4-angled, slender; pappus a mere border or a lacerate-fimbriate crown.

Only the two species here listed are known.

Pappus an obscure entire callous border; leaves sharply serrate. 1. **J. pringlei**.

Pappus a lacerate-fimbriate crown; leaves obtusely serrate or crenate-serrate.

2. **J. pappifera**.

1. **Jaliscoa pringlei** S. Wats. Proc. Amer. Acad. 25: 153. 1890.

Known only from the type locality, Río Grande de Santiago, barranca of Guadalajara, Jalisco.

Erect, branched, obscurely puberulous, 1.6 to 2.6 meters high; leaf blades ovate, 6 to 12 cm. long, acuminate, sharply and closely serrate, loosely glandular-puberulous beneath, more densely so along the veins.

2. **Jaliscoa pappifera** Blake, Contr. U. S. Nat. Herb. 22: 587. 1924.

Known only from the type locality, near Cuernavaca, Morelos.

Similar; leaves obtusely serrate or crenate-serrate, sparsely puberulous beneath with mostly appressed hairs; pappus a lacerate-fimbriate crown about 0.3 mm. high.

The stems of this and the preceding species are always more or less densely riddled by elliptic holes, evidently made by weevils, which sometimes extend quite through the stem.

7. **OAXACANIA** Robins. & Greenm. Amer. Journ. Sci. III. 50: 151. 1895.

1. **Oaxacania malvaefolia** Robins. & Greenm. Amer. Journ. Sci. III. 50: 151. 1895.

Oaxaca and Puebla; type from Tomellín Canyon, Oaxaca.

Suffrutescent, much branched, very leafy, densely glandular-pubescent, about 1 meter long; leaves alternate, the blades roundish, 1.5 to 3 cm. wide, shorter than the petioles, about 5-lobed, the lobes again lobulate; heads 1 to 1.2 cm. high, paniced, pedunculate; involucre about 5-seriate, graduated, the phyllaries dryish, vittate; receptacle paleaceous; flowers white; achenes linear, strongly compressed, blackish, hispidulous with subglandular hairs; pappus a short lacerate crown.

8. **ASCHENBORNIA** Schauer, Linnaea 19: 716. 1847.

1. **Aschenbornia heteropoda** Schauer, Linnaea 19: 716. 1847.

Known only from the type locality, Tacubaya, State of Mexico.

Pubescent shrub; leaves opposite, the blades broad-ovate, 2.5 to 3.7 cm. long and about as wide, acute, coarsely acuminate-serrate, venose, scabrous above, resinous-punctate and pubescent on the veins beneath, very short-petioled; heads 4 to 6 at apex of branches, short-pedicel; involucre cylindric-subhemispheric, the phyllaries imbricate, membranaceous, the outer small, the inner oblong-linear, very obtuse, glabrous; receptacle paleaceous; flowers white; achenes subtetragonous, villous, 4 mm. long; pappus of about 15 membranaceous fimbriate obtuse squamellae about 1 mm. long. (Description compiled.)

9. **AGERATUM** L. Sp. Pl. 839. 1753.

REFERENCE: Robinson, Revision of the genus *Ageratum*, Proc. Amer. Acad. 49: 454-483. 1913.

Herbs or shrubs; leaves usually opposite, ovate or lanceolate; heads usually in a terminal corymbose cluster on a long peduncle; involucre usually campanulate, 2 or 3-seriate, subequal, with narrow, somewhat indurate phyllaries; receptacle naked or paleaceous; achenes 5-angled; pappus a paleaceous crown (in all the following species) or of distinct or basally united, sometimes aristate squamellae. Receptacle paleaceous.

Leaves densely gray-pilose or tomentose beneath.

Leaves lanceolate to ovate, acuminate to acute or obtusish, densely dotted with reddish glands beneath..... 1. **A. paleaceum.**

Leaves ovate, obtuse or acute, not obviously gland-dotted beneath.

2. **A. albidum.**

Leaves green and sparsely puberulous beneath.

Leaves elongate-lanceolate, attenuate, sharply serrate.

8a. **A. salicifolium annectens.**

Leaves ovate, acutish, crenate..... 3. **A. elassocarpum.**

Receptacle naked.

Leaves ovate to ovate-oblong, about twice as long as wide, if rarely lanceolate then narrowed to an obtuse tip.

Leaves dull green or only slightly shining above, beneath dull and usually rather densely pubescent.

Leaves densely whitish-tomentose beneath..... 4. **A. tomentosum.**

Leaves from nearly glabrous to grayish-tomentose beneath.

5. **A. corymbosum.**

Leaves bright green and shiny above, beneath paler but green, and sparsely puberulous on the nerves.

Leaves crenate-serrate; corollas bluish; stem subglabrous.

6. **A. scabriusculum.**

Leaves serrate; corollas white; stem densely incurved-puberulous.

7. **A. lucidum.**

Leaves narrowly lanceolate, attenuate, 3 to 5 times as long as wide.

8. **A. salicifolium.**

1. **Ageratum paleaceum** (C. Gay) Hemsl. Biol. Centr. Amer. Bot. 2: 83. 1881.

Coelestina paleacea C. Gay; DC. Prodr. 5: 107. 1836.

Carelia paleacea Kuntze, Rev. Gen. Pl. 1: 325. 1891.

Ageratum rhytidophyllum Robinson, Proc. Amer. Acad. 36: 476. 1901.

Oaxaca; type collected near City of Oaxaca.

Frutescent, about 60 cm. high; leaves short-petioled, the blades lanceolate to ovate, acuminate to acute, beneath reticulate, canescent-pilose, and densely dotted with reddish glands, 2.5 to 4 cm. long, 8 to 22 mm. wide; corollas purplish blue toward apex.

2. **Ageratum albidum** (DC.) Hemsl. Biol. Centr. Amer. Bot. 2: 81. 1881.
Coelestina albida DC. Prodr. 5: 107. 1836.
Carelia albida Kuntze, Rev. Gen. Pl. 1: 325. 1891.
 Oaxaca; type collected between Oaxaca and Mitla.
 Herbaceous or suffrutescent, up to 60 cm. high; leaves short-petioled, the blades ovate, 2.5 to 6 cm. long, 1.5 to 3.8 cm. wide, obtuse or merely acute, densely dull-pilose beneath, the glands pale and obscure; flowers white.
 This species is described by Robinson as an herbaceous perennial, as it is in two of the sheets in the National Herbarium; Nelson's no. 1208, however, is truly woody below.
- 2a. **Ageratum albidum nelsonii** Robinson, Proc. Amer. Acad. 49: 471. 1913.
 Oaxaca; type collected between Zanantepec and Papana.
 Leaves larger and thinner, broadly ovate, 6 to 11 cm. long, 2.5 to 4.5 cm. wide; petioles longer; corollas apparently bluish.
3. **Ageratum elassocarpum** Blake, Contr. U. S. Nat. Herb. 22: 588. 1924.
 Known only from the type locality, Sierra de Tonalá, Chiapas.
 Base not seen; stem herbaceous above, over 50 cm. high; leaves on petioles 8 to 15 mm. long, the blades triangular-ovate, 3.5 to 7 cm. long, 1.5 to 2.8 cm. wide, narrowed to an obtuse tip, rather dull above, beneath equally green, puberulous along the veins and densely punctate with light glands; heads small, 4 mm. high, the phyllaries and pales somewhat indurate-cuspidate; achenes 1.3 mm. long.
4. **Ageratum tomentosum** (Benth.) Hemsl. Biol. Centr. Amer. Bot. 2: 84. 1881.
Coelestina tomentosa Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 71. 1852.
Carelia tomentosa Kuntze, Rev. Gen. Pl. 1: 325. 1891.
 San Luis Potosí and Puebla to Costa Rica; type from Candelaria, Costa Rica.
 Herbaceous or suffrutescent; leaves short-petioled, the blades ovate to triangular-ovate, 2 to 6.5 cm. long, 1 to 4 cm. wide, obtuse, dull above, densely whitish-tomentose beneath; flowers bluish purple or white.
5. **Ageratum corymbosum** Zuccagni; Pers. Syn. Pl. 2: 402. 1807.
 "Sparganophorus ageratoides Lag. Elench. Pl. 25. 1815."
Ageratum coelestinum Sims in Curtis's Bot. Mag. 42: pl. 1730. 1815.
Coelestina coerulea Cass. Dict. Sci. Nat. 6: Suppl. 8. 1817.
Coelestina ageratoides H. B. K. Nov. Gen. & Sp. 4: 151. 1820.
Coelestina suffruticosa Sweet, Hort. Brit. 229. 1826.
Coelestina corymbosa DC. Prodr. 5: 108. 1836.
Coelestina lessingiana Klotzsch; Walp. Repert. Bot. 2: 545. 1843.
Carelia corymbosa Kuntze, Rev. Gen. Pl. 1: 325. 1891.
Coelestina sclerophylla Woot. & Standl. Contr. U. S. Nat. Herb. 16: 176. 1913.
 Sonora to Zacatecas and the Valley of Mexico. Texas. Type locality not stated.
 Suffrutescent or fruticose, up to 70 cm. high; leaves very variable, the blades 2 to 11 cm. long, ovate to oval or rarely lanceolate, obtuse to acute, from nearly glabrous to dull grayish-tomentose beneath, dotted with pale or reddish glands; flowers violet or white. "Cielitos."
 Numerous varieties and forms based on leaf form and color are described by Robinson.¹

¹ Proc. Amer. Acad. 49: 475-477. 1913.

6. *Ageratum scabriusculum* (Benth.) Hemsl. Biol. Centr. Amer. Bot. 2: 83. 1881.

Coelestina scabriuscula Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 72. 1852.

Carelia scabriuscula Kuntze, Rev. Gen. Pl. 1: 325. 1891.

Western Mexico (between San Blas and Tepic) to Costa Rica; type from Volcán El Viejo, Costa Rica.

Herbaceous or suffruticose, decumbent; leaf blades ovate, 2 to 5 cm. long, 1 to 3.5 cm. wide, crenate-serrate, shining above, beneath duller green, sparsely puberulous along the veins; corollas glabrous, bluish; pappus usually dentate.

7. *Ageratum lucidum* Robinson, Proc. Amer. Acad. 36: 475. 1901.

Morelos; type from Sierra de Topaxtlán, near Cuernavaca.

Frutescent, up to 50 cm. high; leaf blades ovate, 1.5 to 6 cm. long, 7 to 25 mm. wide, obtuse or acute, firm, shining above, beneath light-punctate, sparsely puberulous along the veins; heads broader than high, rather large; corollas white, glandular; pappus subentire.

8. *Ageratum salicifolium* Hemsl. Biol. Centr. Amer. Bot. 2: 83. 1881.

Ageratum strictum Hemsl. Biol. Centr. Amer. Bot. 2: 83. 1881.

Carelia salicifolia Kuntze, Rev. Gen. Pl. 1: 325. 1891.

Carelia stricta Kuntze, Rev. Gen. Pl. 1: 325. 1891.

Jalisco to Morelos; type collected between San Blas and Tepic.

Herbaceous or fruticose, up to 1.3 meters high; leaves short-petioled, the blades narrowly lanceolate, 4.5 to 11 cm. long, 0.5 to 1.7 cm. wide, attenuate, remotely serrate or subentire, green both sides, beneath sparsely puberulous along the veins and densely dotted with yellowish glands; corollas whitish, glandular-dotted; achenes 1.5 to 2 mm. long.

- 8a. *Ageratum salicifolium annectens* Blake, Contr. U. S. Nat. Herb. 22: 588. 1924.

Known only from the type locality, near Cuernavaca, Morelos.

Receptacle paleaceous except in center, the pales linear-subulate.

10. OXYLOBUS Moc.; A. Gray, Proc. Amer. Acad. 15: 25. 1879.

REFERENCE: Robinson, Revision of the genus *Oxylobus*, Proc. Amer. Acad. 49: 483-487. 1913.

Fruticose or suffruticose, densely glandular-pubescent; leaves opposite, subcoriaceous, not punctate; heads cymose-panicled; involucre subequal, the phyllaries subherbaceous, ribbed; receptacle naked; achenes 5-angled; pappus of 5 to 10 unequal, deeply lacerate squamellae.

The genus contains only the following species.

Stem leafy throughout.

Leaves elliptic, entire or subentire, 2 to 10 mm. wide.....1. *O. arbutifolius*.

Leaves oval or oval-ovate, crenate, 10 to 18 mm. wide...2. *O. glanduliferus*.

Leaves chiefly basal, obovate, those of the stem few and remote.

3. *O. adscendens*.

1. *Oxylobus arbutifolius* (H. B. K.) A. Gray, Proc. Amer. Acad. 15: 26. 1879.

Ageratum arbutifolium H. B. K. Nov. Gen. & Sp. 4: 149. 1820.

Phania arbutifolia DC. Prodr. 5: 115. 1836.

Phania trinervia DC. Prodr. 5: 115. 1836.

Oxylobus trinervius Moc.; DC. Prodr. 5: 115. 1836, as synonym.

Carelia arbutifolia Kuntze, Rev. Gen. Pl. 1: 325. 1891.

High mountains, Puebla; type from Mount Naucampatepetl or Cofre de Perote, altitude about 3,110 meters.

Fruticose, decumbent, cespitose, the branches up to 60 cm. long, very leafy; leaves subsessile or short-petioled, the blades elliptic, 8 to 20 mm. long, 2 to 10 mm. wide; heads crowded, white, about 7 mm. high.

2. *Oxylobus glanduliferus* (Schultz Bip.) A. Gray; Klatt, *Leopoldina* 20: 75. 1884.

Ageratum glanduliferum Schultz Bip.; Hemsl. *Biol. Centr. Amer. Bot.* 2: 82. 1881.

Carelia glandulifera Kuntze, *Rev. Gen. Pl.* 1: 325. 1891.

High mountains of Oaxaca; type from Mount Zempoaltepec.

Frutescent, up to 1.3 meters high, leafy; leaf blades oval or oval-ovate, 2 to 3.5 cm. long, 10 to 18 mm. wide, crenate, the lower petioled; heads white or bluish, 7 to 8 mm. high.

3. *Oxylobus adscendens* (Schultz Bip.) Robins. & Greenm. *Proc. Amer. Acad.* 41: 272. 1905.

Ageratum adscendens Schultz Bip.; Hemsl. *Biol. Centr. Amer. Bot.* 2: 80. 1881.

Carelia adscendens Kuntze, *Rev. Gen. Pl.* 1: 325. 1891.

High mountains of Puebla, Hidalgo, and State of Mexico; type from Mount Orizaba.

Scarcely frutescent, creeping and leafy at base; stem herbaceous, up to 50 cm. high, bearing 3 or 4 remote pairs of leaves; leaf blades obovate or spatulate-obovate, 2 to 4 cm. long, 1 to 2 cm. wide, crenulate, narrowed into a shorter petiole; heads crowded at tip of stem, about 8 mm. high.

11. **AGERATELLA** A. Gray in S. Wats. *Proc. Amer. Acad.* 22: 419. 1887.

REFERENCE: Robinson, *Proc. Amer. Acad.* 41: 271. 1905.

Frutescent or suffrutescent, with slender stems and alternate or opposite leaves; heads numerous, small or medium, somewhat racemose-paniculate; involucre strongly graduated, the dryish scarios-margined phyllaries more or less in 5 vertical ranks; receptacle naked; achenes 5-angled; pappus of 5 scarios lance-ovate squamellae prolonged into hispidulous bristles much longer than the achene.

The genus contains only two species.

Leaves opposite, broadly ovate, rhombic-ovate, or obovate.....1. **A. microphylla**.
Leaves alternate, linear to linear-oblancoolate.....2. **A. palmeri**.

1. *Ageratella microphylla* (Schultz Bip.) A. Gray in S. Wats. *Proc. Amer. Acad.* 22: 419. 1887.

Ageratum microphyllum Schultz Bip. in Seem. *Bot. Voy. Herald* 298. 1856.

Decachaeta seemanni Benth. & Hook. *Gen. Pl.* 2: 239. 1873; Hemsl. *Biol. Centr. Amer. Bot.* 2: 78. *pl.* 42. 1881.

Ageratella microphylla seemanni A. Gray in S. Wats. *Proc. Amer. Acad.* 22: 419. 1887.

Sinaloa (?) and Jalisco; type from the Sierra Madre of northwestern Mexico.

Shrubby, about 30 cm. high, much branched; leaves mostly opposite, short-petioled, the blades broadly ovate to rhombic or obovate, 6 to 12 mm. long, 4 to 7 mm. wide, crenate-serrate, veiny, finely puberulous and gland-dotted; heads clustered in the axils and toward tip of stem, cylindric, 8 mm. high, forming a very narrow, loosely spicate panicle.

2. *Ageratella palmeri* (A. Gray) Robinson, *Proc. Amer. Acad.* 41: 272. 1905.

Ageratella microphylla palmeri A. Gray in S. Wats. *Proc. Amer. Acad.* 22: 419. 1887.

Sinaloa and Jalisco; type from Río Blanco, Jalisco.

Suffrutescent, less branched, up to 60 cm. high; leaves alternate, the blades narrowly oblanceolate to linear, 10 to 22 mm. long, 1.5 to 3.5 mm. wide, subentire or sparsely toothed; heads 7 mm. high, numerous in a close or rather loose, spicate or racemelike panicle.

12. *STEVIA* Cav. Icon. Pl. 4: 32. 1797.

Shrubs or herbs, often glutinous, with mostly opposite leaves; heads small, 5 to 8-flowered (in all the following species), corymbose-panicled; phyllaries 5 to 8, subequal, stiffish, subherbaceous; corollas all tubular, slender, white or purplish; achenes slender, usually 5-ribbed, glabrous or hispidulous; pappus of 2 to 12 short squamellae, or slender awns, or both.

Leaves more or less densely griseous-pubescent to canescent-tomentose beneath.

Leaves 2.5 cm. long or less; involucre densely canescent-tomentulose.

1. *S. tephrophylla*.

Leaves 2.5 cm. long or more; involucre green, rarely griseous-tomentellous.

Leaves obscurely petioled, lance-linear, entire, densely canescent-tomentose beneath-----2. *S. revoluta*.

Leaves distinctly petioled, lanceolate to ovate, almost always toothed, griseous-pubescent or puberulous beneath.

Hairs of branches and leaves mostly glandular-capitate.

3. *S. glandulosa*.

Hairs of branches and leaves not glandular-capitate.

Involucre griseous-tomentellous, 4 mm. high; leaves ovate or ovate-elliptic; petioles 3 to 7 mm. long-----4. *S. dictyophylla*.

Involucre merely griseous-pilulous or griseous-pubescent; leaves oblong-ovate to lance-ovate or lance-oblong; petioles usually 8 to 25 mm. long-----5. *S. subpubescens*.

Leaves glabrous or sparsely pubescent beneath.

Leaf blades oval-ovate, obtuse, coarsely crenate, 3.2 cm. long or less, nearly as wide as long-----6. *S. berlandieri*.

Leaf blades linear to ovate or oval-ovate, usually acute, much longer than wide.

Leaves with all veins (including the secondaries) strongly prominulous-reticulate especially beneath.

Pappus of awns and squamellae-----7. *S. nervosa*.

Pappus of short squamellae only.

Stem and leaves pubescent-----8. *S. madrensis*.

Stem and leaves glabrous.

Heads in very dense subglobose glomerules solitary at tips of stem and branches of inflorescence; leaves 8 to 14.5 cm. long, their teeth acute-----9. *S. phlebophylla*.

Heads densely corymbose-paniculate, not glomerate; leaves 7 cm. long or less.

Leaves obtuse to acute, 13 mm. wide or less; petioles 3 mm. long or less-----10. *S. venosa*.

Leaves acuminate, 25 to 30 mm. wide; petioles 20 mm. long.

11. *S. nitida*.

Leaves obscurely veined, or at least with the secondaries not prominulous.

Leaves linear to narrowly lanceolate, 1 cm. wide or less.

Leaves linear or linear-oblancheolate, obtuse, entire, 4 cm. long and 4 mm. wide, or smaller; heads few-----12. *S. collodes*.

Leaves linear to narrowly lanceolate, acuminate, often toothed, usually 6 to 8 cm. long.

Leaves linear-filiform to very narrowly linear-lanceolate, entire or sharply toothed, 0.8 to 4 mm. wide-----13. *S. stenophylla*.

Leaves narrowly lanceolate or linear-lanceolate, usually serrulate, usually 5 to 10 mm. wide-----14. *S. salicifolia*.

Leaves lanceolate to ovate or oval-ovate, rarely less than 1 cm. wide.

Young branches white-lanate, becoming arachnoid, finally glabrate.

15. *S. seleriana*.

Young branches not white-lanate or arachnoid.

Stem villous-pubescent above; pappus of about 10 narrowly linear awns about 0.3 mm. long-----16. *S. microchaeta*.

Stem glabrous or merely puberulous above; pappus otherwise.

Leaves distinctly petioled, the petioles usually 10 to 25 mm. long.

Leaves obtuse or obtusish, ovate, crenate-serrate; stem cinerascenscent-puberulous above-----17. *S. pyrolaefolia*.

Leaves usually acute to acuminate, if obtusish of different shape-----18. *S. lucida*.

Leaves sessile or on petioles 6 mm. long or less.

Leaves sessile, very acute, serrate-----19. *S. connata*.

Leaves short-petioled or with short petioliform bases.

Pappus awns 2 to 10, nearly or quite equaling the corolla; leaves toothed.

Stem thinly velutinous at apex; awns of pappus 10 to 12, equaling the achenes-----20. *S. haenkeana*.

Stem glabrous or sparsely pubescent toward apex; awns of pappus 2 to 5, much longer than the achenes.

21. *S. vernicosa*.

Pappus awns wanting or solitary.

Leaves entire, 6 cm. long or less.

Leaves 3.5 to 6 cm. long; squamellae 0.2 mm. long.

22. *S. flourensioides*.

Leaves 3.3 cm. long or less; squamellae 0.6 mm. long.

23. *S. integra*.

Leaves serrate, 7.5 cm. long-----24. *S. scabrella*.

1. *Stevia tephrophylla* Blake, Contr. U. S. Nat. Herb. 22: 590. pl. 54. 1924.

Known only from the type locality, Los Pinos, Chiapas.

Shrub about 25 cm. high, branched, densely cinereous-tomentulose; leaves opposite, the blades ovate to oval, obtuse, rather abruptly narrowed into the cuneate-margined petioliform base, 2 to 2.5 cm. long, 7 to 13 mm. wide, crenulate, dull cinerascenscent-green above, densely cinereous-tomentulose beneath; corymbs very dense, about 2.8 cm. wide, little exceeding the leaves; flowers white; involucre 4.8 mm. high; pappus of 2 or 3 awns and about 6 squamellae.

2. *Stevia revoluta* Robinson, Proc. Amer. Acad. 44: 617. 1909.

Mountains of Puebla; type from Cerro de Gentile, altitude 2,135 to 2,440 meters.

Shrubby, about 0.5 meter high, dichotomously branched, densely sordid-puberulous above; leaves opposite, the blades linear-lanceolate, 3.5 to 7 cm. long, 3 to 7 mm. wide, acuminate at each end, entire, usually revolute, subsessile, densely canescent-tomentose beneath, dull green and puberulous above; panicles 3.5 to 8 cm. wide; involucre glandular-pilosulous; flowers white; pappus of short lacerate squamellae.

3. *Stevia glandulosa* Hook. & Arn. Bot. Beechey Voy. 296. 1840.

Sonora, Jalisco, and Tepic; type from Jalisco.

Shrubby, dichotomously branched, densely and sordidly spreading-pubescent with chiefly gland-tipped hairs; leaves opposite, the blades ovate, 2.5 to 4 cm. long, 1 to 2.2 cm. wide, acutish, rounded-cuneate at base, serrate, densely glandular-pubescent especially beneath, on petioles 0.5 to 1.5 cm. long; heads densely crowded, the panicles 3 to 5 cm. wide; involucre 5 to 7 mm. high, pubescent with both glandular and eglandular spreading hairs; flowers white; pappus of squamellae only. "Merba" (Tepic).

4. *Stevia dictyophylla* Robinson, Proc. Amer. Acad. 44: 617. 1909.

Guanajuato and Jalisco; type from Guanajuato.

Shrubby, crisp-tomentellous; leaves opposite, the blades ovate or oval-elliptic, 3.5 to 6 cm. long, 12 to 25 mm. wide, acutish, entire or obsolete crenate-dentate, above scabriusculous, beneath paler, crisp-puberulous, prominently reticulate-nervose, on petioles 3 to 7 mm. long; panicles dense, 12 to 14 cm. wide; involucre 4 mm. long, griseous-tomentellous; flowers white; pappus of minute squamellae.

5. *Stevia subpubescens* Lag. Gen. & Sp. Nov. 28. 1816.

Sonora to Valley of Mexico and Oaxaca.

Shrub 1 to 1.6 meters high, branched, griseous-puberulous; leaves opposite, the blades lance-oblong or lance-ovate, 4 to 9.5 cm. long, 1.3 to 2.8 cm. wide, acuminate or acute, at base acutely cuneate, serrulate or subentire, above green, glabrescent or puberulous, beneath densely or sparsely griseous-puberulous or sometimes merely hispidulous along the costa, on naked petioles mostly 1 to 3 cm. long; heads in rather dense panicles usually 3 to 8 cm. wide; involucre densely or sometimes sparsely griseous-pilosulous or puberulous; flowers white; pappus of short squamellae only.

6. *Stevia berlandieri* A. Gray in Torr. U. S. & Mex. Bound. Bot. 73. 1859.

Nuevo León and Tamaulipas; type from San Carlos, Tamaulipas.

Shrubby, about 0.5 meter high, glandular-dotted but essentially glabrous; leaves opposite, the blades oval-ovate, 1.5 to 3 cm. long, 1 to 2 cm. wide, obtuse or acutish, sparsely crenate-serrate, at base rounded or subtruncate, essentially glabrous, on petioles 1 to 2 cm. long; panicles rather dense, 4 cm. wide or less; involucre 6 mm. high, dotted with sessile glands; corollas apparently pinkish; achene glabrous; pappus coroniform, short.

6a. *Stevia berlandieri podadenia* Robinson, Proc. Amer. Acad. 44: 616. 1909.

San Luis Potosí.

Branches, petioles, and leaves crisp-pubescent; involucre stipitate-glandular.

6b. *Stevia berlandieri anadenotricha* Robinson, Proc. Amer. Acad. 44: 617.

1909.

Southwestern Chihuahua.

Densely crisp-puberulous; leaves 4 to 5 cm. long, 3.5 to 4 cm. wide; involucre 3 to 4 mm. high, crisp-puberulous, not glandular.

7. *Stevia nervosa* DC. Prodr. 5: 117. 1836.

Known only from the type locality, near Villalpando, Guanajuato.

Shrubby, the branches densely short-velutinous; leaves opposite or alternate, the blades elliptic, 12 to 30 mm. long, 10 to 12 mm. wide, subacute, at base attenuate, subserrate, thinly pubescent both sides, the nerves prominulous beneath; branches subhirtellous; heads crowded; involucre subhirtellous; achene glabrous; pappus of squamellae and 1 to 3 awns. (Description compiled.)

No specimens of this species have been examined, and its position here in the genus is inferential.

8. *Stevia madrensis* A. Gray, Proc. Amer. Acad. 21: 382. 1886.

Known only from the type locality, among pines on summit of mountains, Cumbre, above Batopilas, Chihuahua, altitude 2,685 meters.

Suffrutescent, about 30 cm. high, branched, incurved-hispidulous; leaves opposite, the blades narrowly elliptic or lance-elliptic, 3 to 6 cm. long, 5 to 9 mm. wide, obtuse or acute, cuneate into the barely petioled base, serrulate, sparsely pubescent and strongly venose both sides, paler green beneath; panicles dense, 1.2 to 2 cm. wide; involucre sparsely appressed-pubescent; flowers lilac-purple; pappus coroniform.

9. *Stevia phlebophylla* A. Gray in S. Wats. Proc. Amer. Acad. **22**: 419. 1887.

Jalisco; type from Río Blanco.

Shrubby, about 1 meter high, simple or slightly branched, glabrous; leaves opposite, the blades oblong-elliptic or oval-ovate, 8.5 to 14 cm. long, 2 to 6 cm. wide, serrulate or sharply serrate, acuminate, cuneate at base, glabrous and glaucescent, very veiny, on petioles 1 cm. long or less; panicles very dense, glomerate, terminating stem and branches of inflorescence; involucre spreading-pubescent and glandular; flowers white; achene glabrous; pappus short, coroniform.

10. *Stevia venosa* A. Gray, Proc. Amer. Acad. **21**: 382. 1886.

Chihuahua; type collected 150 miles north of Batopilas.

Suffrutescent or herbaceous, about 0.5 meter high, simple, glabrous but gland-dotted; leaves opposite or alternate, the blades elliptic or oblong-elliptic, 3 to 6 cm. long, 8 to 20 mm. wide, acute or obtuse, at base cuneate, glabrous, glaucescent, very veiny; panicles dense, 4 to 9 cm. wide; involucre 5 to 7 mm. high, incurved-puberulous and glandular; flowers purplish-tinged; achene hispidulous; pappus short, coroniform.

11. *Stevia nitida* Walp. Linnaea **14**: 320. 1840.

Mexico; definite locality not known.

Fruticose?, glabrous, oppositely branched; leaves opposite, on petioles about 20 mm. long, the blades ovate-elliptic, about 7 cm. long, 25 to 30 mm. wide, acuminate, serrate, glabrous, shining above, glaucous beneath, penninerved; corymb many-headed, terminal; phyllaries obtuse; achene glabrous; pappus coroniform. (Description compiled.)

No specimens of this species have been examined, and its position here is inferential.

12. *Stevia collodes* Greenm. Proc. Amer. Acad. **39**: 93. 1903.

Puebla; type from calcareous hills near Tehuacán.

Shrub about 0.5 meter high or less, oppositely branched, viscid, puberulous above; leaves opposite, sessile or subsessile, linear or linear-oblancoolate, 1.5 to 4 cm. long, 1.5 to 4 mm. wide, obtuse, narrowed at base, entire, thick, obscurely veined, obscurely puberulous or glabrous; heads few, in small subumbelliform panicles about 1 to 2 cm. wide; involucre 7 to 9 mm. long, the phyllaries acute; corollas white, 8.5 to 9 mm. long, glandular except on teeth; achene hispidulous above; pappus coroniform.

13. *Stevia stenophylla* A. Gray, Proc. Amer. Acad. **15**: 25. 1879.

Stevia foliosa Small, Fl. Southeast. U. S. 1163. 1903.

Chihuahua to Querétaro; type collected near San Luis Potosí. Texas.

Slender, oppositely branched shrub, 0.2 to 0.6 meter high, incurved-puberulous chiefly above; leaves opposite, linear-filiform to very narrowly linear-lanceolate, or rarely narrowly lanceolate, 3 to 8 cm. long, 0.8 to 4 mm. wide, acuminate, narrowed into a petioliform base, entire or sharply toothed, essentially glabrous; panicles dense, flattish, 2 to 8 cm. wide; involucre 4 to 5 mm. high, subglabrous or sparsely puberulous; flowers white; achene sparsely hispidulous; pappus of awns and squamellae, rarely of squamellae only.

14. *Stevia salicifolia* Cav. Icon. Pl. **4**: 32. pl. 354. 1797.

?*Stevia angustifolia* H. B. K. Nov. Gen. & Sp. **4**: 149. 1820.

Durango to Mexico and Puebla.

Shrub about 0.6 meter high or less, oppositely branched, appressed-puberulous, especially above, or nearly glabrous; leaves opposite, the blades narrowly lanceolate, linear-lanceolate, or lance-elliptic, 3 to 10 cm. long, usually 5 to 10 mm. wide, acuminate at each end, entire or usually serrulate, on petioles 3 to 10 mm. long; panicles dense, flattish, 2.5 to 14 cm. wide; involucre 5 mm. high,

viscid and sparsely puberulous; flowers white; achene finely hispidulous; pappus usually of awns and squamellae, rarely of squamellae only. "Hierba del aire" (Hidalgo, *Villada*).

14a. *Stevia salicifolia nana* A. Gray, Proc. Amer. Acad. 15: 25. 1879.

San Luis Potosí. A dwarf viscid form, with narrowly lanceolate or oblanceolate, sometimes obtuse leaves only 2 to 3.3 cm. long and 2 to 7 mm. wide. It makes a near approach to the closely related *Stevia stenophylla* A. Gray.

15. *Stevia seleriana* Robinson, Proc. Amer. Acad. 35: 327. 1900.

Known only from the type locality, in mountain woods between San Carlos and Santo Bartolo, Yautepec, Morelos.

Stoutish shrub, white-lanate in youth, soon arachnoid, finally glabrate; leaves opposite, on petioles 1.8 cm. long, the blades oblong, 8 to 10 cm. long, 2.3 to 3 cm. wide, crenate, subentire toward the acutish apex, glabrous; panicle 4 cm. wide; involucre 5 to 6 mm. long; flowers apparently white; pappus squamellate.

16. *Stevia microchaeta* Schultz Bip. Linnaea 25: 291. 1852.

Known only from the type locality, near Oaxaca.

Suffruticulose, somewhat viscous, villous-pubescent above; leaves opposite, lanceolate, 7.5 cm. long, 12 to 14 mm. wide, acuminate at each end, subserrate; panicle compact, very many-headed; involucre 6 mm. long, glabrescent or slightly pubescent, the phyllaries acuminate; achene glabrous, elongate; pappus of about 10 narrowly linear, acute, subcaducous, entire setae about 0.3 mm. long. (Description compiled.)

17. *Stevia pyrolaefolia* Schlecht. Linnaea 16: 326. 1842.

Known only from the type locality, "Mount Kakandó en la Encarnación," Mexico.

Fruticose, cinerascens-puberulous above; leaves opposite, petioled, ovate, rarely obovate or subspatulate, 5 to 6.3 cm. long, 20 to 25 mm. wide, obtuse, cuneate-attenuate at base, glabrous, depressed-crenate-serrate; panicles small, compact; involucre 6 mm. long, the phyllaries obtuse; pappus of squamellae and 1 or 2 awns. (Description compiled.)

18. *Stevia lucida* Lag. Gen. & Sp. Nov. 28. 1816.

?*Stevia glutinosa oaxacana* DC. Prodr. 5: 116. 1836.

?*Stevia grandidentata* Schultz Bip.; Klatt, Leopoldina 20: 75. 1884.

Stevia oaxacana Schultz Bip.; Klatt, Leopoldina 20: 75. 1884, as synonym.

Jalisco and San Luis Potosí to Oaxaca; type from Ixmiquilpan and Zimapán ("Cimmapan"), Hidalgo. Costa Rica.

Shrub about 1 meter high, very viscous, glabrous or puberulous in the inflorescence; leaves opposite, on petioles usually 10 to 25 mm. long, the blades lance-ovate or lanceolate, sometimes ovate or oval-ovate, 3 to 10 cm. long, (0.7) 1.2 to 4 cm. wide, acute or acuminate, rarely obtusish, at base acute to rounded, serrulate to crenate-serrate, glabrous; panicles dense, 7 cm. wide or less; involucre 5 to 6 mm. long, the phyllaries obtuse to acute; flowers white or purplish-tinged; achene finely hispidulous; pappus of awns and squamellae, or of squamellae only. "Hierba de San Marcos."

19. *Stevia connata* Lag. Gen. & Sp. Nov. 27. 1816.

Mexico, without definite locality.

Fruticose, 2 meters high or more, strict, glabrous; leaves opposite below, alternate above, oblong-lanceolate, sessile and connate at base, serrate, very acute; panicle fastigiate; flowers white; pappus of awns and squamellae. (Description compiled.)

20. *Stevia haenkeana* DC. Prodr. 5: 122. 1836.

Mexico, without definite locality.

Suffruticulose at base, oppositely branched, thinly velutinous at apex; leaves opposite, on petioles 6 mm. long, the blades elliptic, 24 to 28 mm. long, 12 mm. wide, attenuate at each end, dentate; phyllaries acuminate; achenes scabriusculous; pappus of 10 to 12 awns as long as the achene. (Description compiled.)

21. *Stevia vernicosa* Greenm. Proc. Amer. Acad. 40: 33. 1904.

Morelos and Mexico; type from Sierra de Tepoztlán, Morelos.

Shrub about 1 meter high, oppositely branched, very viscid, glabrous and verrucose, sometimes somewhat pubescent above; leaves opposite, the blades lance-elliptic to oblanceolate, 1.5 to 4.5 cm. long, 4 to 8 mm. wide, acute or obtuse, narrowed into a petioliform base, serrulate, glabrous, glutinous; panicles dense, small, leafy-bracted; involucre 6 to 8 mm. high, the phyllaries ciliolate, acuminate; flowers white; achene hispidulous; pappus of minute squamellae and 2 to 5 awns about 8 mm. long.

22. *Stevia flourensioides* Blake, Contr. U. S. Nat. Herb. 22: 589. 1924.

Known only from the type locality, Mount Ixtaccihuatl, State of Mexico, altitude 3,355 to 3,660 meters.

Shrub 0.3 meter high and more, very viscid, loosely puberulous above with many-celled hairs, oppositely branched; leaves opposite, elliptic to oblong-elliptic, 3.5 to 6 cm. long, 5 to 16 mm. wide, obtuse or acutish, cuneately narrowed to a subpetiolate base, thick, entire, with obscure veins; panicles 4.5 to 6.5 cm. wide, dense, leafy-bracted; involucre 7 to 8 mm. high, the phyllaries obtuse to acute; flowers white; achene hispidulous; pappus coroniform, 0.2 mm. long.

23. *Stevia integra* Blake, Contr. U. S. Nat. Herb. 22: 589. 1924.

Known only from the type locality, Sierra de la Paila, Coahuila.

Frutescent, about 25 cm. high, sparsely branched, puberulous, especially above, with ascending or appressed hairs; leaves opposite, scattered above, elliptic to elliptic-obovate, 2.5 to 3.3 cm. long, 4 to 9 mm. wide, acute or obtusish, narrowed into a petioliform base, thick, entire, sparsely pubescent on the costa beneath or glabrous, obscurely veined; panicles dense, 1 to 2.8 cm. wide; flowers white; involucre 6 mm. high, the phyllaries obtuse, sparsely puberulous; achenes hispidulous; pappus of squamellae 0.6 mm. long, rarely with a single awn added.

24. *Stevia scabrella* Benth. Pl. Hartw. 19. 1839.

Known only from the type locality, Bolaños, Jalisco.

Suffrutescens, glabrous; leaves subternate, very short-petioled, the blades oblong-elliptic, 7.5 cm. long, 3.8 cm. wide, acute at each end, sparsely serrate, above glabrous and scabrellous; panicle very dense, fastigiate; phyllaries acute; pappus of very short squamellae. (Description compiled.)

DOUBTFUL SPECIES.

STEVIA ELLIPTICA Hook & Arn. Bot. Beechey Voy. 434. 1840-41.

Known only from the type locality, between San Blas and Tepic.

Tall, shrubby, glandular-pubescent; leaves opposite, elliptic or ovate-elliptic, serrate, triplinerved, at base short-attenuate and sessile; heads glomerate; pappus of 3 or 4 awns as long as the corolla. (Description compiled.)

Apparently related to *S. glandulosa* Hook. & Arn.

13. HOFMEISTERIA Walp. Repert. Bot. 6: 106. 1846-47.

Suffrutescens or truly shrubby, branched; leaves alternate or opposite, fleshy, dentate to tripinnatisect, the petioles usually much longer than the blades; heads solitary on long peduncles, or paniced, medium-sized; involucre campanulate, many-seriate, strongly graduate, of narrow acuminate dryish phyllaries;

receptacle naked; achenes linear or prismatic, 2 to 5-ribbed; pappus longer than achene, of 2 to 15 hispidulous bristles and few squamellae, the latter sometimes parted into shorter bristles, or of aristate-tipped squamellae.

Heads paniced; leaves merely dentate.

Leaf blades orbicular or broadly ovate, 0.4 to 2.4 cm. long, half as long as the petioles or more.....1. **H. laphamioides.**

Leaf blades lanceolate or lance-ovate, 2 to 10 mm. long, many times shorter than the petioles.....2. **H. pluriseta.**

Heads solitary on long peduncles; leaves lobed to bipinnatisect.

Leaves very fleshy, bipinnatisect into truly linear segments; squamellae dissected to base into bristles.....3. **H. crassifolia.**

Leaves less fleshy, lobed to bipinnatisect, the ultimate segments not linear; squamellae not dissected.....4. **H. fasciculata.**

1. **Hofmeisteria laphamioides** Rose, Contr. U. S. Nat. Herb. 1: 79. 1890.

Hofmeisteria pluriseta laphamioides I. M. Johnston, Proc. Calif. Acad. IV. 12: 1186. 1924.

Baja California; type from San Pedro Mártir Island.

Shrub 0.6 meter high, glandular-puberulous; leaves chiefly opposite, the blades suborbicular to deltoid-ovate, 0.4 to 2.4 cm. long and wide, crenate to dentate, obscurely or not at all lobed, shorter than the petioles; heads paniced, white; involucre 8 to 10 mm. high, the outer phyllaries with short, obscurely herbaceous, sometimes spreading tips; pappus bristles about 10 to 12, sometimes chaffy-dilated at base, with usually as many alternating squamellae.

1a. **Hofmeisteria laphamioides pauciseta** (I. M. Johnston) Blake.

Hofmeisteria pluriseta pauciseta I. M. Johnston, Proc. Calif. Acad. IV. 12: 1187. 1924.

Baja California; type from San Pedro Nolasco Island, Gulf of California.

Pappus setae 5 to 8, alternating with 5 to 8 oblong squamellae.

2. **Hofmeisteria pluriseta** A. Gray in Torr. U. S. Rep. Expl. Miss. Pacif. 4: Bot. 96. *pl.* 9. 1857.

Northern Baja California. Southwestern United States; type from Bill Williams Fork, Arizona.

Shrubby, much branched, glandular-puberulous, about 30 cm. high; leaves opposite or alternate, the blades chiefly lanceolate or lance-ovate, 2 to 10 mm. long, 1 to 4 mm. wide, entire or few-toothed, on petioles about 2.5 cm. long; heads white; involucre 6 to 8 mm. high; longer pappus bristles about 12, irregularly alternating with about as many much shorter narrow scarious squamellae or bristles.

3. **Hofmeisteria crassifolia** S. Wats. Proc. Amer. Acad. 24: 53. 1889.

Sonora; type from Guaymas.

Suffrutescent, glabrous, with stout branches; leaves alternate, the blades 1 to 1.5 cm. long, triangular in outline, once or twice ternately parted into linear fleshy lobes; heads pink, broader than high; phyllaries glabrous, with erose margins; longer pappus bristles 5, the squamellae dissected into shorter bristles.

The flowers are said to be very fragrant.

4. **Hofmeisteria fasciculata** (Benth.) Walp. Repert. Bot. 6: 106. 1846-47.

Helogyne fasciculata Benth. Bot. Voy. Sulph. 20. *pl.* 14. 1844.

Baja California; type from Magdalena Bay.

Suffruticose or frutescent, essentially glabrous; leaves opposite below, alternate above, the blades deltoid or suborbicular in outline, 1.5 to 4 cm. long and wide, ternately parted or lobed, the lobes again irregularly lobed, the ultimate divisions oblong to triangular; involucre resinous-atomiferous; flowers lilac; pappus bristles 2 or 3; squamellae 2 or 3, linear, merely laciniate.

- 4a. *Hofmeisteria fasciculata xanti* A. Gray in Brewer & Wats. Bot. Calif. 1: 299. 1876.

Hofmeisteria fasciculata grayi T. S. Brandeg. Zoe 5: 160. 1903.

Southern Baja California; type from Cape San Lucas.

Similar, but leaves merely 3-lobed halfway to middle, the lobes broad, sparsely repand-dentate.

- 4b. *Hofmeisteria fasciculata pubescens* (S. Wats.) Robinson, Proc. Amer. Acad. 47: 192. 1911.

Hofmeisteria pubescens S. Wats. Proc. Amer. Acad. 24: 54. 1889.

Baja California; type from Mulejé.

Densely glandular-pubescent, usually taller than the type; leaves often more finely divided than in the typical form.

14. FLEISCHMANNIA Schultz Bip. Flora 33: 417. 1850.

Suffrutescent or herbaceous; leaves opposite or alternate, dentate to biternately parted; heads (in the following species) solitary on long peduncles, the involucre many-seriate, strongly graduate, the phyllaries dry, acuminate, striate; receptacle naked; achenes linear, 5-angled; pappus of 5 to 8 bristles, with minute setulose squamellae between them, or the latter united into a low crown or obsolete.

Stem densely glandular-pubescent.....1. *F. schaffneri*.

Stem glabrate below, sparsely glandular-pilose above.....2. *F. urenifolia*.

1. *Fleischmannia schaffneri* A. Gray, Proc. Amer. Acad. 15: 101. 1879.

San Luis Potosí and Jalisco; type from San Francisco, San Luis Potosí.

Suffrutescent, about 20 cm. high; leaves chiefly alternate, the blades triangular in outline, about 1 cm. long and wide, once or twice ternately parted into spatulate-linear, sparsely dentate lobes 3 mm. wide or less; flowers whitish or purplish-tinged; pappus of 5 or 6 bristles and a low denticulate crown.

2. *Fleischmannia urenifolia* (Hook. & Arn.) Benth. & Hook.; Hemsl. Biol.

Centr. Amer. Bot. 2: 91. 1881, as *F. urenaefolia*.

Phania? *urenifolia* Hook. & Arn. Bot. Beechey Voy. 297. 1840.

Fleischmannia langlassei Robinson, Proc. Amer. Acad. 41: 273. 1905.

Tepic and Michoacán or Guerrero; type from Tepic.

Leaves alternate, the blades trifid or pinnately trisect with stalked trifid terminal lobe, the segments obtuse; phyllaries linear-acuminate, except for a few ovate outer ones. "Clavellilo."

15. PIPTOTHERIX A. Gray, Proc. Amer. Acad. 21: 383. 1886.

Suffrutescent (or herbaceous?), slender, branched; leaves opposite, ovate, petiolate or subsessile; heads small, in close small panicles; involucre about 2-seriate, of mostly subequal, dryish or subherbaceous phyllaries; flowers white; achenes 5-angled; pappus a single series of capillary deciduous bristles.

All the known species of the genus are included in this treatment.

Stem and branches glabrous.

Petioles 1 to 3 cm. long; leaves triangular or deltoid-ovate, 3 to 7 cm. wide.

Petioles 1 to 1.5 cm. long; leaves deltoid-ovate, with 25 to 30 pairs of teeth, the pubescence of the under leaf surface chiefly incurved.

1. *P. goldmanii*.

Petioles mostly 2 to 3 cm. long; leaves triangular-ovate, with 11 to 18 pairs of teeth, the pubescence of the under leaf surface spreading.

2. *P. aegiroides*.

Petioles 1 to 4 mm. long; leaves ovate, 1.3 to 4 cm. wide.

Petioles and leaves glabrous, glaucescent.....3. *P. jaliscensis*.

Petioles and leaves pubescent, not glaucescent.....4. **P. palmeri**.
Stem and branches densely pubescent.

Heads 11-flowered; leaves rather densely pubescent over whole surface beneath.
5. **P. pubens**.

Heads 8-flowered; leaves sparsely short-pubescent beneath chiefly along the
venation.....6. **P. sinaloae**.

1. **Piptothrix goldmanii** Robinson, Proc. Amer. Acad. 35: 328. 1900.

Known only from the type locality, near Batopilas, Chihuahua.

Suffrutescent (?); stem wine-color; leaf blades deltoid-ovate, 6 to 9 cm. long, 4.5 to 7 cm. wide, acuminate, dentate-serrate, sparsely puberulous on the veins beneath; panicles about 7 cm. wide; heads 4 mm. high, about 24-flowered.

2. **Piptothrix aegiroides** Robinson, Proc. Amer. Acad. 41: 273. 1905.

Known only from the type locality, mountains about Etzatlán, Jalisco, altitude 1,830 meters.

Herbaceous (?), 0.6 to 1.3 meters high; stem purplish; leaf blades triangular-ovate, 5 to 7.5 cm. long, 2.5 to 5.8 cm. wide, acuminate, dentate-serrate, pubescent with several-celled hairs on the veins beneath; heads 6 mm. high, 20-flowered.

3. **Piptothrix jaliscensis** Robinson, Proc. Bost. Soc. Nat. Hist. 31: 268. 1904.

Known only from the type locality, mountains above Etzatlán, Jalisco, altitude 1,830 meters.

Suffrutescent (?), 0.6 to 1 meter high; stem glaucescent; leaf blades ovate, 3 to 5 cm. long, 1.8 to 4 cm. wide, acuminate, rounded or subcordate at base; heads in close clusters, 6 mm. high.

4. **Piptothrix palmeri** A. Gray, Proc. Amer. Acad. 21: 383. 1886.

Known only from the type locality, near Batopilas, Chihuahua.

Frutescent; leaf blades ovate, 3 to 5.5 cm. long, 1.3 to 2.8 cm. wide, acuminate, rounded or subcordate at base, puberulous beneath on the veins, as well as on the petioles; panicles rounded, about 4 cm. wide; heads 5 mm. high, white or "ochroleucous."

5. **Piptothrix pubens** A. Gray in S. Wats. Proc. Amer. Acad. 22: 419. 1887.

Chihuahua and Jalisco; type from Río Blanco, Jalisco.

Frutescent, up to 2 meters high; stem and branches sordid-puberulous; leaf blades ovate, 2 to 6.5 cm. long, 1 to 3.2 cm. wide; heads 3.5 to 5 mm. high.

6. **Piptothrix sinaloae** Blake, Proc. Biol. Soc. Washington 32: 190. 1919.

Known only from the type locality, Sierra del Mineral del Tomín, San Ignacio, Sinaloa, altitude 1,500 meters.

Shrub 0.5 to 0.8 meters high; branches densely incurved-pubescent; leaf blades ovate, 5 to 5.5 cm. long, 2 to 3.2 cm. wide, acuminate, serrate.

16. **EUPATORIUM** L. Sp. Pl. 836. 1753.

(Contributed by Dr. B. L. Robinson.)

REFERENCES: H. B. K. Nov. Gen. & Sp. 4: 104-134. 1820; DC. Prodr. 5: 141-186. 1836.

Shrubs or small trees, or often herbs; leaves mostly opposite, filiform to orbicular, membranaceous to coriaceous; heads homogamous, (1-mostly) 5 to 100-flowered, usually in corymbose or thyrsoïd panicles; corollas red, purple, blue, or white, rarely ochroleucous or greenish yellow; anthers appendaged at the tip, entire at base; style branches long and at maturity much exerted, threadlike or more often club-shaped, often colored; achenes columnar to obovoid, 5-ribbed or 5-angled; pappus of many hairlike bristles, white, sordid, straw-colored, roseate, purple, or tawny, usually subequal, occasionally the outermost much shorter.

A very large, chiefly American genus, most diversified and abundant from Mexico to Argentina. Of little economic importance. Some species are applied in folk medicine. Several have value in horticulture. At least one, with aromatic qualities, is used in flavoring tobacco.

A. Receptacle glabrous, flat or nearly so.

B. Involucre cylindrical, (2-)3-5 times as long as thick; phyllaries closely imbricated in 3-5 series. Section CYLINDROCEPHALA.

Phyllaries herbaceous-tipped, tending to be squarrose... 1. *E. sagittatum*.
Phyllaries appressed, not much altered at tip.

Leaves alternate, subsessile..... 2. *E. pulchellum*.

Leaves opposite.

Leaves subsessile by a narrowed cordate base, pinnate-veined.

3. *E. glaberrimum*.

Leaves petioled, 3 to 5-nerved.

Heads 4 to 6-flowered.

Heads subsessile near tips of panicle branches.

Stems terete, hollow; leaves tapering from near base.

4. *E. lozanoanum*.

Stems angled, pithy; leaves broadest near middle.

5. *E. conzattii*.

Heads slender-pedicelated, corymbose..... 44. *E. campechense*.

Heads 10 to 40-flowered.

Heads in ovoid panicles; leaves reticulate-veiny.

Heads about 10 to 13-flowered; involucre 2 to 2.6 mm. thick.

6. *E. bertholdii*.

Heads about 20 to 40-flowered; involucre 4 to 5 mm. thick.

7. *E. ovaliflorum*.

Heads in flattish corymbs; leaves not reticulate... 8. *E. odoratum*.

BB. Involucre normally campanulate or turbinate, rarely more than twice as long as thick; phyllaries less closely imbricated than in the preceding.

C. Phyllaries conspicuously unequal, in 3 or more series. Section SUBIMBRICATA.

D. Heads 1 to 45-flowered; receptacle flat or slightly convex, not noticeably alveolate.

Leaves pinnate-veined.

Petiole not winged.

Leaves opaque.

Proper tube of corolla much longer than throat.

9. *E. araliaefolium*.

Proper tube of corolla not equaling throat.

Leaves 4 times as long as wide, membranaceous, not prominently reticulate..... 10. *E. pinabetense*.

Leaves 2 to 3 times as long as wide, subcoriaceous, reticulate.

Phyllaries rounded at tip..... 11. *E. pittieri*.

Phyllaries pointed at tip..... 12. *E. galeottii*.

Leaves pellucid-reticulate but not pellucid-punctate.

Leaves lance-oblong; achenes smoothish.... 13. *E. oaxacanum*.

Leaves ovate; achenes gray-villous..... 14. *E. eriocarpum*.

Leaves pellucid-punctate, often also pellucid-reticulate.

Veinlets not raised from upper leaf surface.

Heads sessile or nearly so; leaves drying dark or olivaceous.

Leaves membranaceous, obtusish at base.

15. *E. tepicanum*.

- Leaves chartaceo-coriaceous, cuneate at base.
 Inflorescence glabrous or obscurely puberulent. 16. *E. hospitale*.
- Inflorescence tawny-velvety.....17. *E. daleoides*.
- Heads shortly slender-pediceled; leaves drying green.
 Leaves subentire, more than twice as long as wide. 18. *E. hebebotryum*.
- Leaves incisely toothed, less than twice as long as wide. 20. *E. hemipteropodum*.
- Veinlets raised on upper leaf surface.....19. *E. morifolium*.
- Petiole winged, cordate-clasping at base.....21. *E. quadrangulare*.
- Leaves palmate-nerved at or from near base.
 Petiole winged to the cordate-clasping base.
 Stem square in section.....21. *E. quadrangulare*.
- Stem subterete.....22. *E. thyrsoides*.
- Petiole (of cauline leaves) cuneate-winged from top to near middle. 20. *E. hemipteropodum*.
- Petiole not winged.
 Heads thistle-shaped; florets much exceeding the involucre.
 Heads 4 to 6 (to 7) mm. high; involucre turbinate; phyllaries 1-nerved.
 Phyllaries linear to lance-linear, attenuate; leaves bright green, sharply toothed; veins prominently netted between the nerves.....23. *E. ortegae*.
- Phyllaries lanceolate to elliptic, obtuse to merely acutish; leaves dull green, subentire; veins not conspicuously netted.....24. *E. haenkeanum*.
- Heads 7 to 8 mm. high; involucre ovoid.
 Leaves lance-ovate, twice as long as wide, tomentellous beneath.....25. *E. mendezii*.
- Leaves deltoid-ovate, less than twice as long as wide.
 Phyllaries loosely imbricate, narrowly lanceolate, all acute. 26. *E. stillingiaefolium*.
- Phyllaries closely imbricate, lance-oblong to rhombic-ovate.
 Phyllaries acute or acutish; pedicels puberulent to slightly villous.....27. *E. collinum*.
- Phyllaries obtuse; pedicels stoutish and velvety. 28. *E. neaeaeum*.
- Heads not thistle-shaped.
 Heads subsolitary; pedicels 6 to 10 cm. long...29. *E. longipes*.
- Heads clustered; pedicels rarely over 1 cm. long.
 Phyllaries all acute.
 Heads 3 to 6-flowered.
 Leaves ovate; inner phyllaries about 3 mm. long. 30. *E. palmeri*.
- Leaves lanceolate; inner phyllaries 4 to 5 mm. long. 31. *E. solidaginifolium*.
- Heads 10 to 40(to 60)-flowered.
 Petiole (if present) not above one-sixth length of blade.
 Heads 7 to 8 mm. high; leaves glabrous but often glutinous.....32. *E. collodes*.
- Heads 10 to 15 mm. high; leaves pubescent beneath.
 Outer phyllaries ovate, acute.....33. *E. bigelovii*.
- Outer phyllaries ovate-lanceolate, attenuate. 34. *E. turbinatum*.

- Petiole one-fourth to one-third as long as blade.
 Leaves elliptic-lanceolate to ovate-oblong, pointed at base, smoothish-----79. *E. glabratum*.
 Leaves deltoid-ovate, subtruncate to cordate at base, pubescent, crenate-dentate-----35. *E. azureum*.
 Outer and middle phyllaries acute, the inner obtuse.
 Leaves over 10 cm. wide, unlobed-----36. *E. oresbium*.
 Leaves with 1 or 2 sharp lobes or angles on each side.
 37. *E. oresbioides*.
 Leaves 2 to 6 cm. wide, unlobed.
 Heads 12 to 30-flowered.
 Involucre less than half as long as florets, glutinous.
 79. *E. glabratum*.
 Involucre at least two-thirds as long as florets.
 Leaves cuspidate-denticulate, pinnately nerved from well above the base; phyllaries scarcely nerved or striate-----38. *E. hylobium*.
 Leaves serrate to crenate, 3 or 5-nerved from the base; phyllaries distinctly nerved or striate.
 Heads about 1 cm. long; leaves cordate with a narrow sinus, prominently reticulate-veiny beneath-----50. *E. phoenicolepis*.
 Heads 4 to 6 mm. long; leaves acute to rounded or openly cordate at base, not reticulate-veiny.
 39. *E. pycnocephalum*.
 Heads 6 to 8-flowered; phyllaries pearly white.
 45. *E. leucocephalum*.
 Phyllaries all obtuse or rounded at tip.
 Leaves sessile.
 Cauline leaves alternate-----40. *E. adenospermum*.
 Cauline leaves opposite-----41. *E. dryophilum*.
 Leaves petioled.
 Heads 1-flowered, in paniced glomerules.
 42. *E. monanthum*.
 Heads several to many-flowered.
 Heads in subglobose axillary glomerules.
 43. *E. pelotrophum*.
 Heads not in axillary glomerules.
 Heads about 6-flowered.
 Heads about 1 cm. long----44. *E. campechense*.
 Heads about 5 mm. long_45. *E. leucocephalum*.
 Heads 10 to 12-flowered.
 Leaves hastate; pedicels commonly 6 to 10 mm. long.
 Florets about twice as long as inner phyllaries; leaves somewhat fleshy.
 46. *E. peninsulare*.
 Florets scarcely exceeding inner phyllaries; leaves membranaceous.
 47. *E. spinaciaefolium*.
 Leaves ovate, not hastate; pedicels 0 to 3 mm. long.
 20. *E. hemipteropodum*.

Heads 15 to 45-flowered, 5 to 11 mm. high; phyllaries 2 to 5-costulate.

Pedicels glabrous though sometimes glutinous.

Heads 5 to 6 mm. long, in terminal long-peduncled corymbs.....48. *E. blepharolepis*.

Heads 7 to 9 mm. long, in leafy-bracted panicles.
79. *E. glabratum*.

Pedicels villous or glandular-pubescent.

Corollas yellowish to greenish white, dotted with conspicuous orange or brown glands; phyllaries green.....49. *E. nelsonii*.

Corollas purple to rose (rarely white), not conspicuously dotted; phyllaries usually purpletinged.

Heads 4 to 6 mm. high; leaves not reticulate, at base acute to subcordate with open sinus.....39. *E. pycnocephalum*.

Heads about 1 cm. high; leaves reticulate-veiny beneath, cordate with closed sinus.

50. *E. phoenicolepis*.

DD. Heads 50 to many-flowered; receptacle distinctly convex, ellipsoidal or subconical, conspicuously alveolate.

Phyllaries 2 to 5-costulate; leaves palmately 3-nerved practically from base.....35. *E. azureum*.

Phyllaries obscurely nerved or nerveless; leaves pinnately 5 to 9-nerved from well above base. (Showy, nearly herbaceous undershrubs, known chiefly through horticulture and of very doubtful distinctness.)

Phyllaries lance-oblong, 2 to 2.5 mm. wide; pubescence fuscous.
51. *E. constipatiflorum*.

Phyllaries lance-linear, mostly 1 to 1.5 mm. wide; pubescence not fuscous.

Pubescence of stem and inflorescence long, deeply colored, red or purple.....52. *E. atrorubens*.

Pubescence dull, tawny or rusty, sometimes reduced to mere puberulence.

Leaves suborbicular, sometimes 30 to 40 cm. in diameter, acute or obtuse; style branches azure.

53. *E. megalophyllum*.

Leaves broadly ovate, 10 to 15 cm. wide, acuminate at apex, blunt to subtruncate or even shallowly cordate at base; style branches clear rose-color.

54. *E. thespesiaefolium*.

Leaves ovate-oblong to elliptic, usually pointed at base, mostly 6 to 9 cm. wide.

Leaf blade ovate-oblong, about two-thirds as wide as long; petiole one-fifth to fully one-half as long as blade.

55. *E. sordidum*.

Leaf blade elliptic-oblong, less than half as wide as long; petiole very short, not one-tenth as long as blade.

56. *E. miradoreense*.

CC. Phyllaries subequal, in about 2 scarcely imbricate series, usually 1 to 3 of the outermost phyllaries much shorter. Section EXIMBRICATA.

E. Heads 3 to 8(to 10)-flowered.

Leaves pinnately veined.....59. *E. ligustrinum*.

Leaves palmately nerved.

Heads in globose axillary glomerules.....43. *E. pelotrophum*.

Heads not in axillary glomerules.

Corollas nearly tubular, without distinguishable throat.

Leaves dark-punctate beneath.....65. *E. leucoderme*.

Leaves not dark-punctate beneath.

Leaves elliptical, coriaceous; phyllaries chiefly obtuse.

66. *E. albicaule*.

Leaves ovate to lanceolate, membranaceous; phyllaries acute.

Leaves ovate, 2 to 5 cm. wide.....30. *E. palmeri*.

Leaves lanceolate, 8 to 15 mm. wide.

31. *E. solidaginifolium*.

Corollas abruptly or gradually enlarged into a perceptible throat.

Leaves lanceolate to rhombic-oblong, entire or nearly so, 4 to 16 mm. wide.

Leaves lance-oblong, entire, 3 to 4 times as long as wide, vernicose; achenes hispid.....68. *E. glischrum*.

Leaves rhombic-oblong, entire or undulately few-toothed, 1.5 to 2 times as long as wide; achenes glandular-atomiferous.

89. *E. hidalgense*.

Leaves ovate, serrate or dentate, 2 to 4 cm. wide.

60. *E. saltillense*.

EE. Heads normally 10 to 18-flowered but occasionally varying within wider limits.

Leaves linear to lance-oblong.

Leaves mostly attenuate, 3-nerved from the base, gray-pubescent beneath.....70. *E. brevipes*.

Leaves acute or obtusish, pinnate-veined, white-tomentose beneath.

71. *E. liebmannii*.

Leaves (at least the cauline) ovate or ovate-oblong to elliptic or orbicular.

Inflorescence lateral; heads pendulous on long filiform pedicels.

57. *E. cremastum*.

Inflorescence terminal.

Leaves 8 to 14 cm. wide, deciduous before anthesis.

72. *E. crassirameum*.

Leaves rarely over 6 cm. wide, persistent to anthesis.

Inflorescences few(5 to 9)-headed, subsimple, raceme-like.

73. *E. desquamans*.

Heads many, glomerate or subracemose on spreading panicle branches; corollas little longer than achenes.

Petioles of cauline leaves about 3 mm. long; heads 4 to 5 mm. high, densely clustered at tips of panicle branches; phyllaries 2.5 to 3 mm. long; Veracruz.

64. *E. pseudoperfoliatum*.

Petioles of cauline leaves 9 to 17 mm. long; heads 4.5 to 6 mm. long, more loosely clustered; phyllaries 3.5 to 5 mm. long, attenuate; San Luis Potosí.....62. *E. longifolium*.

Petioles of cauline leaves 2 to 4.5 cm. long; heads subracemously disposed.....63. *E. solidaginoides*.

Heads corymbose; corollas 1.5 to 3 times as long as achenes.

Achenes densely canescent-villous.....74. *E. rupicola*.

Achenes glabrous or glandular to hispid, not canescent-villous.

Pappus half to two-thirds length of corolla.

Branchlets terete; leaves of firm texture.

Leaves elliptic to obovate, obtuse at tip, cuneate at base.....75. *E. viburnoides*.

- Leaves ovate, caudate-acuminate at tip, cordate at base.....69. *E. areolare*.
 Branchlets tetragonal; leaves thinly membranaceous.
76. *E. tetragonum*.
 Pappus at least three-fourths length of corolla.
 Leaves pinnate-veined.
 Leaves about 7 cm. long, acuminate, subglabrous above; petiole about one-eighth as long as blade.
77. *E. adenachaenium*.
 Leaves about 5 cm. long, obtusish to acute, sparsely setulose above; petiole about one-fourth as long as blade.....58. *E. lucidum*.
- Leaves palmately or subpalmately nerved.
 Phyllaries somewhat vernicose.
 Phyllaries lance-linear, attenuate.
 Leaves membranaceous, obtuse, coarsely crenate-dentate, pubescent beneath.
78. *E. brandegeanum*.
 Leaves subcoriaceous, acuminate, subentire, glabrous or nearly so....80. *E. subintegrum*.
 Phyllaries oblong, obtusish or merely acute.
 Leaves rhombic-ovate to oblong, cuneate at base; lateral inflorescences on short suberect branches.....79. *E. glabratum*.
 Leaves prevailingly ovate, mostly subtruncate or rounded at base; lateral corymbs on spreading-ascending branches....81. *E. espinosarum*.
- Phyllaries not vernicose.
 Petioles (of cauline leaves) 1.2 to 7 cm. long.
 Cauline leaves reniform-ovate, cordate, coarsely crenate, broader than long.
61. *E. hederæfolium*.
 Cauline leaves ovate (deltoid with rounded angles), about as wide as long, ferruginous beneath.
82. *E. hebes*.
 Cauline leaves ovate to oblong, longer than broad, not ferruginous.
 Phyllaries elliptic, obtuse or barely acute.
24. *E. haenkeanum*.
 Phyllaries lanceolate or narrowly oblong-linear, acute to attenuate.
 Leaves glabrous beneath.
 Phyllaries dorsally glabrous, nerveless or obscurely nerved; leaves 2.5 to 4.5 cm. long, subcoriaceous...83. *E. havanense*.
 Phyllaries dorsally glandular-atomiferous and puberulent, 1 or 2-costulate; leaves 6 to 10 cm. long...84. *E. gracilicaule*.
 Leaves somewhat arachnoid-pubescent beneath, at least tufted in axils of the larger veins; heads in a mostly elongate thyrses.
85. *E. mairetianum*.

- Leaves pubescent beneath but not arachnoid nor tufted in axils of veins; heads corymbose.
- Phyllaries about half length of florets, deep purple.---86. *E. subpenninervium*.
- Phyllaries acutish to attenuate, decidedly more than half as long as florets.
- Phyllaries pale green, not dark-dotted.
87. *E. vernale*.
- Phyllaries dark purple, dotted with dark sessile glands.---88. *E. chiapense*.
- Petioles not exceeding 1 cm. in length.
- Petioles at least one-sixth as long as blade.
- Heads (or most of them) sessile or subsessile in small glomerules at tips of panicle branches; leaves oblong, 5 to 10 cm. long; tall shrubs or small trees with pale cortex.
- Leaves coriaceous; phyllaries rounded to acutish at tip.-----66. *E. albicaule*.
- Leaves membranaceous; phyllaries attenuate.
67. *E. ymalense*.
- Heads well pediceled; leaves 1 to 3 (to 5) cm. long.
- Phyllaries linear to narrowly lanceolate.
- Phyllaries conspicuously 2-ribbed, at least the outer ones beset with dark glands.
78. *E. brandegeanum*.
- Phyllaries faintly if at all ribbed, not glandular.
- Leaves not punctate, deltoid-ovate.
- Leaves dull green, tawny-puberulent, subentire.-----82. *E. hebes*.
- Leaves bright green, smooth or nearly so, coarsely toothed.
83. *E. havanense*.
- Leaves dark-punctate, rhombic-ovate to ovate-oblong.---89. *E. hidalgense*.
- Phyllaries ovate to oblong, nearly always pubescent or glandular dorsally.
- Corymbs dense, terminal, ovoid, many-headed, 5 to 10 cm. in diameter; leaves rhombic-ovate, 3 to 5 cm. long.
90. *E. rhomboideum*.
- Corymbs small and numerous, few-headed; leaves rarely above 2.5 cm. in length.
- Leaves densely canescent-tomentose beneath, soft in texture, only 5 to 8 mm. long.-----91. *E. irrasum*.
- Leaves glabrous, glandular, or pubescent, never tomentose beneath.
- Leaves faintly lepidote above, thin, the rameal ovate-oblong and entire or nearly so.---92. *E. porriginosum*.

Leaves not lepidote.

Corollas white; rameal leaves (apt to be conspicuously numerous) smaller than the cauline, oval, entire or nearly so; northern Mexico.....93. *E. wrightii*.

Corollas roseate or purple-tinged; rameal leaves rarely differentiated; central and southern Mexico.

Leaves thick, firmly coriaceous, glandular-punctate chiefly on the often prominent and slightly furrowed veinlets beneath.

94. *E. calophyllum*.

Leaves membranaceous to chartaceous, punctate on surface between the closely netted veinlets beneath..95. *E. calaminthaefolium*.

Petioles not over one-tenth as long as the leaf blades.....96. *E. glaucum*.

EEE. Heads 20 to many-flowered.

Young leaves more or less vernicose; branches arcuate or flexuous, usually nodulose; heads large, 1 to 1.5 cm. long; florets little exceeding the involucre.

Leaves 1 to 2 cm. long; most of the rameal internodes not over 2 to 7 mm. long.

Leaves elliptic-lanceolate, about 5 mm. wide, cuneate at base.

98. *E. mygindaefolium*.

Leaves ovate, about 1 to 1.5 cm. wide, rounded at base.

99. *E. campylocladum*.

Leaves 3 to 6 cm. long.

Cauline leaves deltoid-ovate, shallowly cordate, more than two-thirds as wide as long, acuminate, exceedingly glutinous.

100. *E. vernicosum*.

Cauline leaves ovate-oblong, barely acute to obtuse, rounded at base, not two-thirds as wide as long, slightly glutinous.

101. *E. multiserratum*.

Leaves not vernicose.

Leaves lanceolate to lance or linear-oblong, not one third as wide as long.

Leaves entire, 1 to 2.2 cm. long.....102. *E. hyssopinum*.

Leaves serrate, 2.5 to 9 cm. long.

Leaves 3-nerved from near the base.

Petioles (of cauline leaves) 1 to 2 cm. long; leaves subglabrous.

103. *E. riparium*.

Petioles (of cauline leaves) 1 to 5 mm. long; leaves grayish-pubescent.....70. *E. brevipes*.

Leaves pinnate-veined, white-tomentose beneath.

71. *E. liebmannii*.

Leaves ovate, oblong, or suborbicular, more than one-third as wide as long.

Petioles 1 to 2 mm. long, not one-tenth as long as leaf blades.

97. *E. rhodopodum*.

Petioles rarely less than 1 cm. long.

Leaves rounded at apex.

Cinereous-tomentellous; leaves mostly deltoid-ovate and shallowly cordate; branches 6-angled; corymbs 3 to 5 (to 9) cm. in diameter; phyllaries acute, green.

104. *E. tomentellum*.

Ochraceous-tomentellous; leaves suborbicular-ovate, abruptly pointed to rounded or rarely cordate at base; branches subterete; corymbs 9 to 12 cm. wide; phyllaries obtuse, ochraceous.....

105. *E. loesenerii*.

Leaves acute to acuminate.

Heads 4 to 4.5 mm. high; leaves 2 to 4 cm. wide, entire at the obtusely pointed base.....

106. *E. malacolepis*.

Heads 5 to 7 mm. high; leaves 5 to 12 cm. wide, incisely toothed to the cuneately decurrent base.

107. *E. conspicuum*.

Heads 6 to 11 mm. high; leaves not toothed to base.

Leaves areolate above by a fine prominent reticulation of veinlets, narrowly ovate, caudate-acuminate.

69. *E. areolare*.

Leaves not noticeable areolate, acute or moderately acuminate.

Leaves palmately 3-nerved from a usually rounded base.

Decumbent, fruticulose; corymbs mostly 2 to 5-headed.

108. *E. oligocephalum*.

Erect shrubs with many-headed corymbs.

Phyllaries oblong, obtuse, erose, scarious-margined.

109. *E. aschenbornianum*.

Phyllaries lance-linear, acute to attenuate, subherbaceous throughout.

Achenes obscurely puberulent to glabrous; heads 20 to 25-flowered; phyllaries acute, about half as long as florets; leaves rounded or but subcordate at base; pubescence not glandular.

110. *E. etlense*

Achenes distinctly hispid; heads 30 to 40-flowered; phyllaries attenuate, more than half as long as florets; leaves subtruncate to deeply cordate at base; inflorescence glandular-pubescent.

Leaves deltoid-ovate, 1 to 3 (to 4) cm. wide; petiole 4 to 10 mm. long.

111. *E. scorodonioides*.

Leaves broadly ovate with rounded sides; petiole mostly 2 to 6 cm. long.

112. *E. petiolare*.

Leaves pinnately 5-nerved or palmately 3-nerved from a point above the base.

Inflorescence (if normally developed) elongate, forming an ovoid to subcylindric thyse.

Leaves 6 to 10 cm. long, acute to rounded at base, arachnoid-tufted in axils of veins beneath.

85. *E. mairetianum*.

Leaves 3 to 4.5 cm. long, truncate to cordate at base, not arachnoid-tufted.....113. *E. pringlei*.

Inflorescence a flattish to moderately convex corymb.

Heads 20 to 40-flowered; phyllaries 0.5 to 1.2 mm. wide; pappus simple.

Phyllaries 4 to 5 mm. long, scarcely half length of mature florets, deep purple.

86. *E. subpenninervium*.

Phyllaries 6 to 8 mm. long, decidedly more than half as long as mature florets, acutish to attenuate.

Pubescence pale to whitish, that on the inflorescence gland-tipped; phyllaries pale green, hispid with white hairs, not dark-dotted.

87. *E. vernale*.

Pubescence purple, fading to rusty, that on inflorescence gland-tipped; phyllaries dark purple and dotted with dark sessile glands.

88. *E. chiapense*.

Heads about 60-flowered; phyllaries 1.5 to 1.8 mm. wide; pappus double.....114. *E. chapalense*.

AA. Receptacle hairy. Section *HEBECLINUM*.

Leaves lance-linear to narrowly ovate or oblong, not half as wide as long, pinnate-veined.

Heads about 8 mm. high; corymbs rather dense, 4 to 5 cm. wide; leaves glabrous, attenuate, remotely cuspidate-denticulate.

115. *E. tuerckheimii*.

Heads 10 to 12 mm. high; corymbs lax, 8 to 12 cm. wide; leaves grayish-puberulent on both surfaces, closely serrulate-denticulate.

116. *E. ehrenbergii*.

Leaves ovate, more than half as wide as long, palmately nerved.

117. *E. perornatum*.

1. *Eupatorium sagittatum* A. Gray, Pl. Wright. 1: 88. 1852.

Sonora and Sinaloa; type, though said to be from California, presumably from coastal Sonora.

Slender-stemmed, intricately branched shrub, 1 to 2 meters high; leaves petiolate, lanceolate or ovate, sagittate, tomentellous on both surfaces, mostly 2 to 3 cm. long and half as wide; heads about 35-flowered, 1 cm. long, on somewhat clavate pedicels in open corymbs; corollas lilac.

1a. *Eupatorium sagittatum* var. *deltophyllum* Robinson, Proc. Amer. Acad. 42: 45. 1906.

Sinaloa; type from Culiacán.

Leaves much broader, deltoid, sometimes wider than long. Otherwise like the typical form.

2. *Eupatorium pulchellum* H. B. K. Nov. Gen. & Sp. 4: 119. *pl.* 345. 1820.

Chihuahua to Puebla and Jalisco; type from shore of Lake Tezcuco, State of Mexico.

Scarcely woody, upright, leafy-stemmed, simple to the corymbose inflorescence, 0.6 to 1.5 meters high; leaves alternate, oblong-lanceolate to ovate, serrate, 3-nerved from near the base; heads very numerous in a dense, round-topped or flattish, compound panicle; corollas purple.

- 2a. *Eupatorium pulchellum* var. *angustifolium* S. Wats.; Pringle, Pl. Mex. 1889: 2nd [unnumbered] page of printed list. 1889; Robinson, Proc. Amer. Acad. 51: 534. 1916.

Known only from the type station, near Guadalajara, Jalisco.

Leaves longer (8 to 11 cm. in length) and relatively narrower (1 to 2 cm. in width) than in the typical form, subentire.

3. *Eupatorium glaberrimum* DC. Prodr. 5: 144. 1836.

Known only through the type collection, from Mexico without stated locality, presumably from Guerrero.

Shrub, smooth throughout; stem round; leaves obovate-oblong, acuminate, narrowed below to an obtuse subsessile base, serrate, feather-veined, 12 to 17 cm. long, about a third as wide; heads about 20-flowered, cylindrical, corymbose, pediceled; phyllaries closely appressed, rounded at tip.

- 3a. *Eupatorium glaberrimum* var. *michelianum* Robinson, Contr. Gray Herb. n. ser. 68: 18. 1923.

Eupatorium michelianum Robinson, Proc. Amer. Acad. 41: 276. 1905.

Stems, inflorescence, and leaf midribs beset with spreading dark hairs; leaves mostly narrower than in the typical form; corollas white.

4. *Eupatorium lozanoanum*¹ Robinson, Proc. Amer. Acad. 41: 275. 1905.

Hidalgo; type collected in a barranca below Trinidad Iron Works.

Branching shrub, 3 to 4 meters high, smooth throughout; leaves lance-ovate, caudate-acuminate, sharply but rather remotely serrate, pinnately 5-nerved from near the base, 8 to 10 cm. long, 2 to 3 cm. wide, short-petioled; heads 4-flowered, subsessile by 3's or 5's at the tips of the panicle branchlets; involucre cylindrical, several-seried; phyllaries thin, green, acutish.

5. *Eupatorium konzattii* Greenm. Proc. Amer. Acad. 34: 574. 1899.

Veracruz; type locality, "in humid forests on the Cerro del Chiquihuite, Colonia Melchor Ocampo, alt. 1300 m."

Glabrous, somewhat lucid, probably shrubby; stems slightly compressed, 6-angled; leaves opposite, oblong, acuminate, serrate, thickish, apt to be rugose, dark green on both faces, pinnately 5-nerved, the outer pair of nerves small, intramarginal, the others prominent; blade 9 to 14 cm. long, 3.5 to 5 cm. wide; petiole slender, about 1.5 cm. long, slightly winged toward summit; panicle large, terminal, divaricately branched; heads mostly sessile and clustered at tips of the branchlets; phyllaries round-tipped, glabrous, yellowish brown, striate.

6. *Eupatorium bertholdii*² Schultz Bip. in Seem. Bot. Voy. Herald 299. 1856. Tepic; type locality, Sierra Madre.

Shrub, pubescent or puberulent; stems round, distinctly ligneous, becoming 1 cm. or more in diameter; leaves ovate, acute to acuminate at apex, acutish at base, shallowly serrate to entire, 3-ribbed from above the base, sparingly pubescent on the upper surface, reticulate beneath, 5 to 13 cm. long, 1.5 to 5 cm. wide; petiole 1 cm. long; heads 10 to 13-flowered, sessile to short-pediceled, paniculate; involucre slender; phyllaries obtuse to rounded, striate, stramineous to brownish or purplish-tinged.

- 6a. *Eupatorium bertholdii* var. *stenophyllum* Robinson, Proc. Amer. Acad. 35: 331. 1900.

Jalisco; type from canyons near Guadalajara.

Leaves of firmer texture, lance-ovate, scarcely one-fourth as wide as long, entire.

¹ Filemón L. Lozano, for several years a field-assistant of C. G. Pringle in his botanical exploration of Mexico.

² Dr. Berthold Seemann, 1825-1871, naturalist on the voyage of the Herald (1845-1851).

7. *Eupatorium ovaliflorum* Hook. & Arn. Bot. Beechey Voy. 297. 1840.

Tepec; type locality stated merely as Mexico.

Shrub, 1 to 2 meters high; stems round, canelike; leaves narrowly ovate, serrate, acuminate, subcoriaceous, at first downy on the upper surface, but later minutely and densely papillose, beneath pubescent to subtomentose, strongly reticulate-veiny, pinnately 5-nerved, 5 to 12 cm. long, 2 to 4.5 cm. wide; petiole 3 to 12 mm. long; heads about 23-flowered, mostly short-pedicelcd, in small round-topped panicles; involucre oval, the phyllaries ovate, obtuse, commonly tinged with purple or brown, closely appressed, striate, ciliolate.

8. *Eupatorium odoratum* L. Syst. Nat. ed. 10. 1205. 1759.

Eupatorium conyzoides Mill. Gard. Diet. ed. 8. *Eupatorium* no. 14. 1768.

Eupatorium divergens Less. Linnaea 5: 138. 1830.

Eupatorium graciliflorum DC. Prodr. 5: 145. 1836.

Osmia odorata Schultz Bip. Pollichia 22-24: 250. 1866.

Osmia divergens Schultz Bip. Pollichia 22-24: 252. 1866.

Osmia graciliflorum Schultz Bip. Pollichia 22-24: 252. 1866.

Common in nearly all parts of Mexico which are suited by climate for mesophytic vegetation. Widely distributed in tropical America.

Vigorous shrub, erect or somewhat vinelike, with long, leaning or reclining stems; leaves triangular- or rhombic-ovate, acuminate, abruptly narrowed to a more or less pointed base, mostly serrate or crenate and often near the broadest part of the blade somewhat hastately toothed, rarely entire, from glabrous to tomentose, slender-petioled; heads numerous, in flattish corymbs, mostly 15 to 25-flowered; corollas pale blue to white. "Xtokabal" (Yucatán); "cihuapatli," "ciguapazle," "crucita" (San Luis Potosí, *Seler*); "Santa María" (Porto Rico); "crucita olorosa," "garrapata" (Nicaragua); "varejón de caballo" (Colombia). *Seler* reports that the roots are employed as an emmenagogue.

9. *Eupatorium araliaefolium* Less. Linnaea 6: 403. 1831.

Eupatorium omphaliacfolium Kunth & Bouché, Ind. Sem. Hort. Berol. 1844, coll. adnot. no. 13; Walp. Repert. Bot. 6: 113. 1846-47.

Eupatorium heterolepis Robinson, Proc. Amer. Acad. 35: 335. 1900.

Veraacruz; type collected in woods at Misantla. British Honduras and Guatemala.

Soft-woody shrub, glabrous except in inflorescence; stems 6-angled and often compressed; leaves oblong-elliptic, pointed at both ends, entire, feather-veined, subcoriaceous and somewhat fleshy, opaque, drying dark, 11 to 19 cm. long, 4 to 7 cm. wide; petiole about 5 cm. long; heads paniculate, about 25-flowered, 1 cm. long; inner phyllaries long, narrow, subequal, caducous, the outer much shorter, persistent; corollas white.

Introduced into European horticulture and for several decades cultivated as a greenhouse plant of some decorative value.

10. *Eupatorium pinabetense* Robinson, Proc. Amer. Acad. 36: 482. 1901.

Known only from the type locality, near Pinabete, Chiapas.

Shrubby, essentially glabrous; stems somewhat 6-angled; leaves oblong-lanceolate, attenuate at both ends, serrulate, feather-veined, mostly 10 to 15 cm. long, 2 to 3 cm. wide, opaque, firmly membranaceous; heads about 35-flowered, 4 mm. high, in dense rounded panicles; phyllaries yellowish brown, obtusish, ciliolate.

11. *Eupatorium pittieri* Klatt, Bull. Soc. Bot. Belg. 31: 192. 1892.

Chiapas. British Honduras, Guatemala, and Costa Rica.

Shrub, finely pubescent; leaves elliptic-oblong, acuminate, acute at base, serrate (rarely entire), feather-veined, thickish, opaque; veins prominent beneath; heads small, numerous in open pyramidal panicles; phyllaries broadly ovate to elliptical, mostly rounded at the tip, 3 to 5-nerved.

12. *Eupatorium galeottii* Robinson, Contr. Gray Herb. n. ser. 68: 17. 1923.
Veracruz; type collected on the Cordillera at an altitude of about 915 meters.
In habit and foliage close to the preceding, but said to be less lignescent; phyllaries all pointed.
13. *Eupatorium oaxacanum* Klatt, Abh. Naturf. Ges. Halle 15: 324. 1882.
Oaxaca; type said to have been collected on the mountains of this State.
A smooth, viscid and somewhat vernicose shrub; branches and foliage rather willow-like; leaves opposite, short-petioled, lanceolate, pointed at each end, serrulate, feather-veined, of firmish texture, 4 to 6 cm. long, 12 to 14 mm. wide; heads about 10-flowered, in trichotomous flattish corymbs; phyllaries lanceolate to oblong, acute.
Without obvious Mexican affinities and known only from immature and fragmentary material of an obscure collector, this species is subject to considerable doubt.
14. *Eupatorium eriocarpum* Robins. & Greenm. Proc. Amer. Acad. 32: 42. 1896.
Oaxaca; type from Tomellín Canyon.
Shrub 1.5 to 2.5 meters high; branches smooth, brown; leaves rhombic-ovate, acuminate, acute at base, serrate, green and glabrous on both surfaces except for some woolly pubescence mostly in the axils of the veins beneath, membranaceous, feather-veined, 8 to 12 cm. long, 4 to 5 cm. wide; petioles 6 to 11 mm. long; heads mostly 5-flowered, about 12 mm. long, nodding in a large leafy-bracted panicle; phyllaries ovate, rounded at tip, striate; achenes densely white-tomentose.
15. *Eupatorium tepicanum* (Hook. & Arn.) Hemsl. Biol. Centr. Amer. Bot. 2: 101. 1881.
Hebeclinium tepicanum Hook. & Arn. Bot. Beechey Voy. 434. 1841.
Tepic; type collected between San Blas and Tepic.
Smooth shrub with pale spreading branches and short internodes; leaves narrowly ovate to oblong-lanceolate, acuminate, obtuse or barely acute at base, crenate-serrate, pellucid-punctate; heads both pediceled and sessile, about 5-flowered, borne in an ovoid puberulent thyrse; phyllaries ovate to elliptical, rounded at tip, stramineous, caducous; achenes thickish, grayish-tomentellous.
Known as yet only from the original collection.
16. *Eupatorium hospitale* Robinson, Proc. Amer. Acad. 43: 32. 1907.
Eupatorium vanillosmoides Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 102. 1881. Not *E. vanillosmoides* Schultz Bip.; Baker in Mart. Fl. Bras. 6: 346. 1876.
Veracruz and Chiapas; type from Mirador, Veraacruz.
Smooth shrub; branchlets dark, shining, 6-angled; leaves oblong, attenuate to each end, serrate, thickish, of firm texture, drying dark, feather-veined, pellucid-punctate, 12 to 15 cm. long, 5 to 6 cm. wide; heads about 6-flowered, sessile mostly in 2's or 3's at the tips of the panicle branchlets; inner phyllaries oblong, deciduous, the outer ovate, much shorter, more persistent, usually purple-tinged; florets violet and fragrant (*Galeotti*); achenes pointed at base, hispid.
Stems sometimes locally deformed by swollen hollow insect-inhabited galls, whence the specific name.
17. *Eupatorium daleoides* (DC.) Hemsl. Biol. Centr. Amer. Bot. 2: 94. 1881.
Critonia daleoides DC. Prodr. 5: 141. 1836.
Tamaulipas, Veracruz, and Tabasco; type locality Tampico. Guatemala, El Salvador, Costa Rica, and Panama.
Usually shrubby and 2 to 3 meters high, sometimes a small tree (*Ervendberg*) or at times only a vigorous perennial herb, crisped tawny-pubescent, at least on

the younger parts; leaves oblong or ovate-oblong, acute to acuminate, cuneate at base, serrate, feather-veined, coriaceous, 10 to 20 cm. long, 3 to 6 cm. wide, pellucid-punctate and -lineolate; heads numerous in rounded or ovoid, divaricately branched panicles, 5-flowered, sessile; phyllaries stramineous, ovate to narrowly oblong, obtuse; corollas white or purplish.

18. *Eupatorium hebebotryum* (DC.) Hemsl. Biol. Centr. Amer. Bot. 2: 95. 1881, as *hebebotrya*.

Critonia hebebotrya DC. Prodr. 5: 141. 1836.

Morelos; type locality stated merely as Mexico. El Salvador, Guatemala, and Costa Rica.

Tree of medium size or tall shrub; branches curved, light brown or gray; branchlets angled; leaves rhombic-ovate, acuminate, acute at base, crenate-serrate, feather-veined or pinnately somewhat 5-nerved from above the base, pellucid-punctate and -lineolate, 10 to 20 cm. long, 4 to 8 cm. wide; petioles 1.5 to 3 cm. long; branchlets of the dense ovoid thyrses tomentellous; heads small, about 5-flowered, slender-pedicelled; phyllaries pale green to stramineous, obtuse or rounded at tip. "Tamagua" (El Salvador).

Wood used for construction in El Salvador.

19. *Eupatorium morifolium* Mill. Gard. Dict. ed. 8. *Eupatorium* no. 10. 1768.

Eupatorium populifolium H. B. K. Nov. Gen. & Sp. 4: 111. 1820.

Eupatorium critonioides Steetz in Seem. Bot. Voy. Herald 145. 1853.

Eupatorium megaphyllum Baker in Mart. Fl. Bras. 6²: 322. 1876.

Eupatorium sartorii Schultz Bip.; Klatt, Leopoldina 20: 91. 1884.

Tamaulipas, San Luis Potosí, and Oaxaca; type from Veracruz. Widely distributed in Central and tropical South America.

Shrub or stout herb 2 to 6 meters high; stems thick, costate, fistulose; leaves suborbicular-ovate and rounded or subcordate at base, bluntly acuminate, coarsely serrate, feather-veined or pinnately 5-nerved from somewhat above the base, prominently reticulate beneath, coriaceous, mostly 10 to 20 cm. long and 6 to 13 cm. wide, nearly glabrous at maturity; petioles 2 to 5 cm. long; heads small, 6 to 13-flowered, in dense ovoid thyrses; corollas greenish white; phyllaries pale green or stramineous, ovate, obtuse, arachnoid-pubescent. "Arbol de Santa María" (Veracruz); "taco," "chimaliote," "suelta con suelta," "vara hueca," "carrizo" (El Salvador).

20. *Eupatorium hemipteropodum* Robinson, Proc. Amer. Acad. 42: 39. 1906.

"*Eupatorium aromatisans* DC.;" Millsp. & Chase, Field Mus. Bot. 3: 92. 1904.

Yucatán; type from Izamal.

Robust perennial herb, probably becoming somewhat ligneous toward the base; stems smooth, costate; leaves ovate, incisely serrate, membranaceous, cuneately decurrent upon the upper part of the petiole; heads about 10-flowered, borne in ovoid thyrses; phyllaries stramineous. "Chiople," "chiopk."

The leaves are used for flavoring tobacco. An infusion of the leaves in alcohol is applied externally for the relief of pain in rheumatism and kindred affections, and taken internally for stomach disorders.

21. *Eupatorium quadrangulare* DC. Prodr. 5: 150. 1836.

Sinaloa, Durango, Jalisco, Guerrero, and Veracruz; type from Tantoyuca, Veracruz. Guatemala and El Salvador.

Stout perennial, either herbaceous throughout or decidedly woody toward the base, often (especially in the inflorescence) puberulent to rather copiously pubescent or tomentellous; stems canelike, hollow, sharply 4-angled; leaves large, opposite, ovate, acute, serrate, abruptly narrowed at base of blade to a broadly winged petiolar portion, biauriculate at the insertion on the stem; heads mostly 8 to

10-flowered, borne in a dense rounded terminal thyrse; phyllaries stramineous, ovate-oblong, obtusish, striate; corollas white or nearly so; florets fragrant. "Chimaliote" (El Salvador).

22. *Eupatorium thyrsoides* Moc.; DC. Prodr. 5: 150. 1836.

Tepic, Colima, and Guerrero(?); type locality cited merely as Mexico.

Stem terete or somewhat 4-angled when young. In all other respects exceedingly close to the preceding species, of which it may well prove a mere variety.

Little known and in need of close field study. Including *Eupatorium thyrsoides* β *puberum* DC. op. cit. 151, merely a slightly hairy form.

23. *Eupatorium ortegae* Robinson, Contr. Gray Herb. n. ser. 75: 10. 1925.

Durango; type from La Bajada.

Smoothish shrub with slender terete branches; leaves opposite, slender-petioled, deltoid-ovate, acuminate, sharply and rather coarsely dentate, abruptly contracted at base, bright green and prominently reticulate on both surfaces, firm in texture, subcoriaceous, 3.5 to 8 cm. long, 2.5 to 5 cm. wide; petiole 1.5 to 3 cm. long; heads about 6 mm. high, thistle-shaped, borne in rounded, paniculately disposed corymbs; pedicels bearing 3 to 7 linear-subulate bractlets; phyllaries narrowly lanceolate, attenuate; corollas white.

24. *Eupatorium haenkeanum* DC. Prodr. 5: 158. 1836.

Guerrero and Oaxaca; type locality stated merely as Mexico.

Shrub with recumbent liana-like stems (*Langlassé*); branches round, rather slender, puberulent to velutinous; leaves rhombic-ovate, gradually acuminate to apex, more abruptly cuneate at base, entire to undulate or crenate-serrate, firmly membranaceous, sparingly puberulent, 3-nerved, 6 to 8 cm. long, 3 to 5 cm. wide; petiole slender, 1 to 2 cm. long; heads about 20-flowered, long-pedicelled, in open compound leafy-bracted corymbose panicles; involucre sub-turbinate; phyllaries elliptic-oblong, obtusish; corollas white.

A somewhat more pubescent form has been distinguished as *Eupatorium haenkeanum* β ? *velutinum* DC. Prodr. 5: 158. 1836.

25. *Eupatorium mendezii* DC. Prodr. 5: 160. 1836.

Guanajuato, San Luis Potosí, and Querétaro; type locality at the west of Guanajuato City.

Shrub; stems round, slender; branches shortly velvety or covered with a grayish crisped puberulence; leaves triangular-ovate or ovate-lanceolate, gradually acuminate, serrate, puberulent above, tomentellous beneath, 3-nerved, 6 to 9 cm. long, 2.5 to 4.5 cm. wide; petioles slender, 1 to 2 cm. long; heads about 25-flowered, pedicellate, disposed in round-topped compound bracteate panicles; involucre ovoid; phyllaries rhombic- or oblong-lanceolate, acute or acutish, pubescent, usually brown or purple-tinged; corollas white.

26. *Eupatorium stillingiaefolium* DC. Prodr. 5: 160. 1836.

Tamaulipas and Veracruz; type from Tamaulipas.

Shrub, 1.3 to 2 meters high, obscurely puberulent, with habit and foliage as in the preceding; leaves more deltoid-ovate and abruptly contracted or even rounded at base; petiole 1.5 to 3.5 cm. long; heads 20 to 25-flowered; phyllaries lance-oblong, all acute; corollas roseate.

A little known species.

27. *Eupatorium collinum* DC. Prodr. 5: 164. 1836.

Eupatorium nigrescens Hook. & Arn. Bot. Beechey Voy. 297. 1840.

Kyrtstenia collina Greene, Leaflets 1: 9. 1903.

Widely distributed and frequent from Chihuahua and Tamaulipas to Chiapas; type from Tantoyuca, Veracruz. Guatemala, El Salvador, Nicaragua, and Costa Rica.

Shrub 1 to 5 meters high; stems and branches terete; leaves deltoid-ovate, acuminate, mostly crenate to serrate, rarely subentire, at base cuneate, or more often abrupt or rounded or even subcordate, firmly membranaceous, green on both sides, obscurely puberulent to spreading-pubescent, at least on the nerves beneath, 5 to 10 cm. long, 3 to 7 cm. wide, glandular-punctate beneath; petiole slender, 1 to 3 cm. long; heads 24 to 46-flowered, about 8 mm. long, somewhat fastigiate grouped in round-topped corymbs, mostly slender-pedicled; corollas white; phyllaries lanceolate to oblong, mostly obtuse. "Cuilotillo" (*Kerber*); "vara blanca," "vara de cama," "arnicacho" (El Salvador).

The vernacular names "hierba del ángel" and "yolochichitl" have been reported for this species. The plant is said to be bitter and aromatic and to be employed locally for affections of the liver and digestive system. It is reported also that the leaves have been employed as a substitute for hops in the brewing of beer. The same properties and uses are reported for several related species.

28. *Eupatorium neaezanum* DC. Prodr. 5: 160. 1836.

Guerrero, Oaxaca, and Chiapas; type collected near Acapulco. Guatemala (?).

Shrub, in habit and foliage much resembling the preceding species, but more robust; branchlets and inflorescence densely white-tomentose; pedicels short, thick; heads about 25-flowered; corollas white; phyllaries broadly oblong or elliptic, obtuse or acutish.

29. *Eupatorium longipes* A. Gray, Proc. Amer. Acad. 15: 26. 1879.

Bulbostylis pedunculosa DC. Prodr. 5: 138. 1836.

Eupatorium pedunculatum A. Gray, Pl. Wright. 1: 86. 1852; Hemsl. Biol.

Centr. Amer. Bot. 2: 97. 1881. Not *E. pedunculatum* Hook. & Arn. 1836.

San Luis Potosí, Hidalgo, and Michoacán; type locality, "Mexico circa Villapando."

Fruticose, many-stemmed from a branching, usually decumbent, slightly woody base; stems slender, flexuous, 20 to 40 cm. high; leaves opposite (or the uppermost alternate), oval to ovate-lanceolate, about 1 cm. long, 4 to 7 mm. wide, obtuse, 1 or 2-toothed on each side or entire, narrowed at base to a short petiole; heads terminal, solitary, about 14 mm. high, about 25-flowered, on peduncles 1.5 to 10 cm. in length; phyllaries oblong, acute, cuspidate, purple-stained on the exposed part.

30. *Eupatorium palmeri* A. Gray, Proc. Amer. Acad. 21: 383. 1886.

Eupatorium arborescens Jones, Contr. West. Bot. 12: 43. 1908.

Sonora, Chihuahua, Sinaloa, Jalisco, and Colima; type locality, "shady places high up in mountains above Batopilas."

Slender branching shrub, at times becoming arborescent; leaves ovate and ovate-lanceolate, acuminate, serrate, rounded at base, mostly 5 to 7 cm. long and 2.5 to 4 cm. wide, membranaceous, subglabrous above, softly pubescent at least on the nerves and veins beneath, 3 to 5-nerved from near the base; petiole about 1 cm. long; heads 8 to 10-flowered, 4 mm. long, subsessile or shortly pedicled in loose pyramidal leafy-bracted panicles; phyllaries lanceolate.

30a. *Eupatorium palmeri* var. *tonsum* Robinson, Proc. Amer. Acad. 42: 43, 1906.

Known only from the type locality, El Ocote, near the boundary between Michoacán and Guerrero.

Leaves glabrous on both surfaces, longer and much more gradually caudate-acuminate than in the typical form, as much as 14 cm. long and 4 cm. wide.

31. *Eupatorium solidaginifolium* A. Gray, Pl. Wright. 1: 87. 1852.

Chihuahua, Coahuila, and Durango. Type locality, "mountains between the Limpia and the Rio Grande" in western Texas; also Arizona and probably New Mexico.

A low, much-branched, nearly glabrous, calciphile shrub; leaves lanceolate to narrowly ovate, attenuate, subentire, mostly rounded at base, 3 to 5.5 cm. long, 1 to 1.8 cm. wide; petiole 4 to 10 mm. long; heads about 5-flowered, often closely aggregated by 2's and 3's at the tips of the branchlets of the ovoid thyrse-like panicles; phyllaries about 8, lanceolate, 3-nerved; corollas white.

32. *Eupatorium collodes* Robins. & Greenm. Amer. Journ. Sci. III. 50: 152. 1895.

Oaxaca; type from Las Sedas.

A subglabrous but somewhat viscid and vernicose shrub, 60 to 90 cm. high; branches virgate, leafy, purple; leaves opposite, ovate, sessile, acute, serrate except near the rounded base, 2 to 3.5 cm. long, 1.3 to 2 cm. wide, subcoriaceous; heads 20 to 25-flowered, in round-topped corymbs (5 to 10 cm. in diameter); phyllaries lance-linear, puberulent and ciliate, acute, usually purple; corollas white; pappus rose-colored.

33. *Eupatorium bigelovii* A. Gray in Torr. U. S. & Mex. Bound. Bot. 75. 1858-59.

Eupatorium bigelovii Hemsl. Biol. Centr. Amer. Bot. 2: 93. 1881.

Eupatorium madrense S. Wats. Proc. Amer. Acad. 26: 137. 1891.

Coahuila, Nuevo León, and San Luis Potosí. Type collected on the Gila in Arizona.

Shrub or slightly lignescent perennial herb; leaves ovate, acute, sharply and often rather coarsely serrate, 3-nerved, rounded at base, 3 to 7 cm. long, 1.5 to 3.5 cm. wide, finely pubescent above, pubescent to canescent-tomentose beneath; petioles mostly 2 to 7 mm. long; heads 1.2 to 1.6 cm. high, many-flowered, in few-headed cymes; phyllaries lanceolate, acutish to acuminate, striate, green or more often purple; corollas purplish.

A calciphile of middle altitudes.

34. *Eupatorium turbinatum* A. Gray, Proc. Amer. Acad. 15: 26. 1880.

Known only from the original collection, secured in a mountain ravine between San Luis Potosí and Tampico.

Probably somewhat shrubby; stems erect, subterete, purple, soon glabrate, leafy; leaves opposite, sessile, ovate, attenuate, rounded at base, sharply serrate (the teeth few, subremote and unequal), 3-nerved, smooth or nearly so above, softly pubescent to grayish-tomentose beneath, of firm texture, 5 to 6 cm. long, 2 to 3 cm. wide; heads corymbed or subsolitary, pediceled, 30 to 40-flowered, 1.5 cm. long; involucre turbinate; phyllaries numerous, linear, subulate-attenuate, striate, purplish, of firm texture.

35. *Eupatorium azureum* DC. Prodr. 5: 168. 1836.

Tamaulipas, Nuevo León, and San Luis Potosí; type collected at Monterrey.

Shrub with spreading tomentellous branches; stem leaves deltoid-ovate, acute, nearly truncate or even subcordate at base, coarsely toothed at the broadest part, somewhat puberulent above, pubescent to grayish-tomentellous beneath, usually 4 to 6 cm. long, 3 to 4 cm. wide, on slender petioles (1 to 2 cm. long), the rameal leaves usually smaller and more narrowly ovate; heads about 1 cm. in diameter, usually 40 to 70-flowered, slender-pediceled, in small, rather dense, terminal corymbs; phyllaries herbaceous, striate, at least the inner acute; corollas azure.

Used for astringent poultices (*Gregg*).

36. *Eupatorium oresbium* Robinson, Proc. Amer. Acad. 35: 337. 1900.

Morelos; type from a "wet mountain canyon above Cuernavaca, 6,500 ft."

Shrub, 3 to 5 meters high; leaves opposite, ovate, acuminate, cuspidate-dentate, rounded or subcordate at base, 5 or 7-nerved near the base, thin, spreading-villous on the nerves beneath, otherwise nearly smooth, about 13 cm.

long and 11 cm. wide; petiole 7 to 10 cm. long; corymbs trichotomous, convex, moderately dense; heads about 16-flowered; phyllaries thin, not conspicuously nerved, pale green, the inner oblong, obtuse, the outer much shorter, lanceolate, acute; corollas trumpet-shaped, gradually expanded upward, purple but in old specimens turning yellow, exceeding the white pappus.

37. *Eupatorium oresbioides* Robinson, Proc. Amer. Acad. **44**: 618. 1909.

Oaxaca; type from "Alturas de Oaxaca, 1,800 m." Guatemala.

Shrub, resembling the preceding but with leaves somewhat smaller (8 to 11 cm. long) and mostly hastately angled on one or both sides; petioles 1.5 to 5 cm. long; corymbs much rounded, oblate-spherical; phyllaries and corollas purple-tinged.

38. *Eupatorium hylobium* Robinson, Proc. Bost. Soc. Nat. Hist. **31**: 249. 1904.

Known only from the original collection, secured in mountain woods between San Martín and Ococingo, Chiapas.

Shrub with terete flexuous branches at length roughened by prominent lenticels; leaves rhombic-ovate, sharply serrate, thin, membranaceous, green and glabrous above, slightly paler and puberulent on the veins beneath, 5 to 7 cm. long, half as wide; corymbs leafy-bracted, round-topped, about 10 cm. in diameter; pedicels filiform, flexuous, 3 to 6 mm. long; heads about 14-flowered, 7 mm. high; phyllaries pale green, thin, nearly nerveless, the inner oblong, obtuse, the outer much shorter, lanceolate, attenuate; corollas gradually enlarged upward, glabrous, the limb very short.

39. *Eupatorium pycnocephalum* Less. *Linnaea* **6**: 404. 1831.

Eupatorium diversifolium Schrad. Ind. Sem. Hort. Gotting. **1829**: 2. 1829, without character.

Eupatorium virgatum Schrad. Ind. Sem. Hort. Gotting. **1829**: 2. 1829, without character.

Eupatorium schiedeanum Schrad. Ind. Sem. Hort. Gotting. **1832**: 3. 1832.

Eupatorium sonorae A. Gray, Pl. Wright. **2**: 74. 1853.

Common throughout Mexico. Widely distributed in the warmer parts of continental America.

A tropical weed 30 to 80 cm. high, for the most part wholly herbaceous but occasionally developing distinctly lignescient stems; leaves opposite, petiolate, deltoid-ovate, acuminate, crenate-serrate; heads about 25-flowered, 4 to 6 mm. long, aggregate in small dense rounded corymbs, these often numerous and disposed in ample leafy-bracted panicles; phyllaries mostly elliptic-ovate, the middle and inner rounded at tip, the outermost sometimes acute; corollas purple (rarely white). "Mejorana" (El Salvador); "mejorana morada" (Guatemala).

40. *Eupatorium adenospermum* Schultz Bip. in Seem. Bot. Voy. Herald **299**. 1856.

Type locality, Sierra Madre; subsequently collected only in the Sierra Madre between Michoacán and Guerrero.

Shrub or perennial herb, erect, with slender, terete, virgate, brownish purple, leafy stems; leaves alternate, subsessile, firm-chartaceous, ovate-oblong, acute, subentire or serrulate, 4 to 7 cm. long, 2 to 3 cm. wide, reticulate-veiny on both surfaces, puberulent on the chief veins beneath, sprinkled with sessile resinous globules; corymbs fastigiately branched, flattish; heads about 15 mm. high, about 10-flowered; phyllaries pluriseriate, ovate-oblong, rounded at tip; corollas nearly tubular, white; style branches conspicuously clavate, yellow; achenes slender, tapering at base, closely beset with globular glands.

41. *Eupatorium dryophilum* Robinson, Proc. Amer. Acad. **36**: 478. 1901.

Eupatorium adenospermum var. *pleianthum* A. Gray, Proc. Amer. Acad. **15**: 26. 1879.

Eupatorium pleianthum Robinson, Proc. Amer. Acad. **36**: 483. 1901.

Jalisco; type locality, "rocky hills near Guadalajara."

Erect perennial, about 60 cm. high, slightly lignescent toward the base, with habit and inflorescence as in the preceding; leaves opposite or subopposite (except a few of the uppermost), sessile, oval to ovate, rounded to acute at tip, serrate, of firm texture, 1.5 to 4.5 cm. long, two-thirds as wide; heads 1.5 cm. high; phyllaries several-seriate, ovate-oblong, rounded at tip, usually purple-tinged; achenes slender, glandular-atomiferous.

42. *Eupatorium monanthum* Schultz Bip. in Seem. Bot. Voy. Herald **299**, 1856.

Colima, Guerrero, and Oaxaca, at 150 to 700 meters; type from the "Sierra Madre."

A straggling, alternately branched shrub; stems terete, mottled, pithy, scarcely lignescent; leaves alternate, slender-petioled, suborbicular-ovate, obtuse to more often shortly acuminate, entire to serrulate, mostly 3 to 8 cm. long and 2.5 to 7 cm. wide; heads 1 or 2-flowered, in paniculately disposed spherical glomerules, sessile. "Zacate minero."

Popularly believed to be an indicator of mineral deposits (*Langlassé*).

43. *Eupatorium pelotrophum* Robinson, Proc. Amer. Acad. **42**: 44. 1906.

Known only from the original collection, secured in clayey soil on the Sierra Madre, near the boundary of Michoacán and Guerrero, altitude 2,300 meters.

Shrub 1.5 meters high; branches virgate, slender, terete, dark brown, puberulent; leaves opposite, ovate, caudate-acuminate, serrate at the sides, rounded at base, 3 or 5-nerved from the base, 7 to 10 cm. long, 2 to 4 cm. wide, of firm texture, sparingly puberulent and openly reticulate-veiny on both surfaces; petiole about 1 cm. long; heads commonly 4-flowered, in short axillary nodding cymes at length forming subglobose glomerules about the upper nodes; phyllaries about 9, lance-oblong, obtuse, purplish brown, scarcely half as long as the florets; corollas white.

44. *Eupatorium campechense* Robinson, Proc. Amer. Acad. **43**: 30. 1907.

Campeche; type from Apazoli near Yohaltún.

Shrubby, nearly glabrous; branches slender, terete, striate, smooth; leaves opposite, petiolate, lanceolate, attenuate, often falcate, 3-nerved, thickish, shining, 8 to 10 cm. long, 2.4 to 3 cm. wide, rather distantly serrate-toothed, glabrous or nearly so; petiole about 1 cm. long; heads about 5-flowered, slender-pedicel, in flattish corymbs; phyllaries stramineous, smooth, striate, obtuse, somewhat 5-ranked vertically; corollas pale, tubulate; achenes pubescent.

45. *Eupatorium leucocephalum* Benth. Pl. Hartw. **86**. 1841.

Veracruz, Puebla, Oaxaca, and Chiapas. Guatemala, where the type was collected at Acatenango; also El Salvador.

Suffruticose, 1 to 3 meters high, often slightly pubescent; stems terete; leaves opposite, lance-oblong, long-acuminate, coarsely serrate, 3-nerved from near the entire, obtuse or cuneate base, 6 to 10 cm. long, 2 to 3.5 cm. wide; petiole 1 to 3 cm. long; heads small, 6 to 8-flowered, slender-pedicel in large ovoid thyrses; phyllaries ovate to oblong, white, lustrous. "Flor de plata," "hierba de plata," "coyontura" (El Salvador); "chilea," "chileo" (Guatemala).

45a. *Eupatorium leucocephalum* var. *anodontum* Robinson, Proc. Amer. Acad. **51**: 534. 1916.

Known only from the type collection, secured at La Victoria, near the boundary between Michoacán and Guerrero.

Leaves subentire, somewhat narrower than in the typical form.

46. *Eupatorium peninsulare* T. S. Brandeg *Erythea* 7: 4. 1899.

Southern Baja California; type from San José del Cabo.

Shrub of smoothish appearance but finely pubescent; stems erect, 1 to 2 meters high; leaves opposite, petiolate, deltoid-hastate, acuminate, crenate-serrate to subentire, abruptly narrowed at base, subcoriaceous, 3-nerved; heads about 10-flowered, in a terminal leafy-bracted pyramidal panicle; involucre much shorter than the florets; phyllaries oval to oblong, rounded at tip, striate-costulate, ciliate; corollas slender, tubulate, yellowish white.

46a. *Eupatorium peninsulare* var. *epipolimum* Robinson, *Contr. Gray Herb. n. ser.* 73: 17. 1924.

Baja California; type from Aguaje de Santana.

Grayish-tomentellous; otherwise essentially like the typical form.

47. *Eupatorium spinaciaefolium* (DC.) A. Gray in *Torr. U. S. & Mex. Bound. Bot.* 75. 1858-59.

Bulbostylis spinaciaefolia DC. *Prodr.* 5: 139. 1836.

Eupatorium hastile Schauer, *Linnaea* 19: 719. 1847.

Tamaulipas and San Luis Potosí; type collected between Victoria and Tula, Tamaulipas.

Erect opposite-branched calciphile shrub; leaves opposite, petiolate, triangular-hastate, acuminate, irregularly toothed, membranaceous, green and scantily puberulent on both surfaces; heads 10 to 12-flowered, in ample leafy panicles; involucre nearly equaling the florets; phyllaries oval to oblong, rounded at tip, stramineous, striate; corollas yellowish or greenish white.

48. *Eupatorium blepharolepis* Schultz Bip. in *Seem. Bot. Voy. Herald* 300. 1856.

Known only from the original collection, said to have come from the Sierra Madre.

Slender glabrous shrub with terete purple branches; leaves opposite, ovate or lance-ovate, acute or narrowed to an obtuse tip, sparingly serrate, 3-nerved, mostly 2 to 3 cm. long, half as wide; petiole 2 to 4 mm. long; corymbs rounded, terminal on long peduncles; heads small (about 5 mm. high), 30 to 40-flowered; phyllaries oblong, blunt, purple-stained.

49. *Eupatorium nelsonii* Robinson, *Proc. Amer. Acad.* 35: 337. 1900.

Guerrero and Oaxaca; type collected between Ayusinapa and Petatlán, Guerrero.

Shrub, 1.5 to 3 meters high; leaves opposite, ovate, acuminate, dentate at the sides, cordate or subcordate and sometimes slightly hastate at base, 3 to 7-nerved, membranaceous, finely pubescent, 7 to 10 cm. long, 4 to 5 cm. wide; petiole 3 to 4.5 cm. long; heads about 16-flowered, in short, opposite, chiefly axillary corymbs, nodding; phyllaries elliptical, rounded at tip, light green striate.

50. *Eupatorium phoenicolepis* Robinson, *Proc. Amer. Acad.* 35: 338. 1900.

Known only from the original collection, obtained between San Cristóbal and Teopisca, Chiapas.

Slender-stemmed shrub or perennial herb; leaves opposite, petiolate, ovate, acuminate, finely crenate-serrate, cordate at base, usually with a narrow sinus, above puberulent, dull green, below paler, reticulate-veiny, 5 to 7 cm. long, 2.5 to 4.5 cm. wide; corymbs strongly convex or even ovoid; heads about 18-flowered, 1 cm. long; corollas crimson or purple.

51. *Eupatorium constipatiflorum* Klatt, *Ann. Naturhist. Hofmus. Wien.* 9: 355. 1894.

Known only from the type material, collected in Mexico by Galeotti in 1844; its label is unnumbered and as to locality illegible.

Probably a soft-wooded shrub, clothed with fuscous tomentum; leaves opposite, rhombic-ovate, long-acuminate, often falcate, sharply serrate, about 8 cm. long, 3 to 3.5 cm. wide, cuneate at base; heads few, large, densely clustered; phyllaries oblong, acute, dorsally puberulent on the upper part; corollas purple

52. *Eupatorium atrorubens* (Lem.) Nicholson, Diet. Gard. 1: 540. 1885.

Hebeclinium atrorubens Lem. Illustr. Hort. 9: pl. 310. 1862.

?*Eupatorium grandiflorum* André, Rev. Hort. 1882: 384 (with unnumbered plate). 1882.

?*Eupatorium raffillii* Hemsl. in Curtis's Bot. Mag. 134: pl. 8227. 1908.

Raised from seed collected in Mexico (probably Chiapas) by Ghiesbreght.

Robust but scarcely lignescent, 60 to 80 cm. high; stems several, terete, densely clothed with long, spreading, red or purple, jointed hairs; leaves 10 to 30 cm. long, more than two-thirds as wide, opposite, petiolate, acuminate at apex, obtuse to cordate at base, cuspidate-dentate; corymbs terminal, 20 to 30 cm. in breadth; heads numerous, about 12 mm. high; phyllaries lance-linear, attenuate, red or purple-villous on the back.

A species marked by the highly colored pubescence closely investing its stems. Introduced into European horticulture about 1862. Scarcely more than a selected or ameliorated form of *E. sordidum* Less.

53. *Eupatorium megalophyllum* (Lem.) Klatt, Leopoldina 20: 90. 1884.

Hebeclinium macrophyllum Lem. Cat. Hort. J. Versch.; Lem. Illustr. Hort. 9: 74. 1862.

Hebeclinium megalophyllum Lem. Illustr. Hort. 9: 73. 1862; Regel, Gartenflora 16: pl. 548. 1867.

Described from cultivated material believed to have been of Mexican origin; not known in the wild.

A stout suffrutescent plant with terete green stems; leaves opposite, long-petioled, suborbicular, bluntly pointed to subcordate at base, shortly pointed at apex, shallowly cuspidate-dentate, often 30 cm. or more in diameter; corymbs compound, dense, 30 to 50 cm. wide; heads about 60-flowered; phyllaries oblong-linear, acute; corollas illustrated as roseate and the conspicuous style branches as azure.

Not satisfactorily known.

54. *Eupatorium thespesiaefolium* DC. Prodr. 5: 164. 1836.

Morelos and probably Orizaba; the type from Mexico without locality.

Hollow-stemmed shrub or perhaps scarcely more than a stout herb, 1.5 to 2.5 meters high; stems terete, densely covered with sordid, somewhat tawny wool; leaves opposite, petiolate, ovate, acuminate, very blunt or subtruncate at base, pinnately 7 to 9-nerved, thin, 18 to 22 cm. long, 10 to 15 cm. wide; corymbs 5 to 15 cm. in diameter; phyllaries lanceolate, tomentellous on back; corollas and especially the long style branches clear rose color.

Doubtfully distinct from the following.

55. *Eupatorium sordidum* Less. Linnaea 6: 403. 1831.

Conoclinium ianthinum Morren, Ann. Soc. Agr. Bot. Gand 5: 173. 1849.

Hebeclinium ianthinum Hook. in Curtis's Bot. Mag. 77: pl. 4574. 1851.

Hebeclinium panamense Carr. Rev. Hort. 1877: 330 (with unnumbered plate). 1877.

Eupatorium ianthinum Hemsl. Biol. Centr. Amer. Bot. 2: 96. 1881.

Eupatorium brevipetiolatum Klatt, Leopoldina 20: 90. 1884; in part only, namely as to plant of Sartorius.

Eupatorium septuplinervium Klatt, Leopoldina 20: 90. 1884.

Hebeclinium sordidum Schultz Bip.; Klatt, Leopoldina 20: 91. 1884.

Hebeclinium macrocephalum Schultz Bip.; Klatt, Leopoldina 20: 91. 1884.

Eupatorium "subtripplinervium Klatt;" Pringle, Pl. Mex. 1899: on 2nd [un-numbered] page; a clerical error for *E. septuplinervium* Klatt, as explained by Hemsl. in Curtis's Bot. Mag. 134: pl. 8227. 1908.

Veracruz and San Luis Potosí; also from the boundary between Michoacán and Guerrero; originally collected on the "Cuesta grande de Chiconquiaco" and in the woods of Jalapa.

Shrub with terete stems clothed on the younger parts with dense, sordid or tawny, woolly pubescence, this occasionally reduced to a short puberulence; leaves opposite, ovate to ovate-oblong, sharply serrate to merely cuspidate-denticulate, shortly acuminate, pinnately somewhat 5-nerved from well above the base, 7 to 10 cm. long, 5 to 8 (or 10) cm. wide; petiole 2.5 to 5 cm. long; corymbs dense, convex, 4 to 8 cm. in diameter; phyllaries linear, acuminate, dorsally tomentellous; flowers violet, fragrant. "Xiquite" (Oaxaca, Reko).

This species has long been in cultivation in different but inconstant forms, much confused as to their naming and in no way clarified by showy though very inaccurate horticultural plates.

56. *Eupatorium miradoreense* Hieron. Bot. Jahrb. Engler 28: 576. 1901.

Eupatorium brevipetiolatum (Schultz Bip.) Klatt, Leopoldina 20: 90. 1884, as to Liebmann's no. 87 on which Schultz based his *Hebeclinium brevipetiolatum*; not, however, *Eupatorium brevipetiolatum* Schultz Bip.; Baker in Mart. Fl. Bras. 6²: 335, in obs. 1876.

Hebeclinium brevipetiolatum Schultz Bip.; Klatt, Leopoldina 20: 90. 1884.

Veracruz; as yet known only from the original collection secured by Liebmann at Petlapa.

Shrub closely resembling the preceding and having its terete branches similarly clothed with a dirty-tawny wool; leaves distinctly oblong, mostly narrow-acuminate, acute at base, 9 to 15 cm. long, 4 to 7 cm. wide, merely cuspidate-denticulate, distinctly and regularly pinate-veined; petiole 5 to 12 mm. long; otherwise much like the preceding.

57. *Eupatorium cremastum* Robinson, Proc. Amer. Acad. 42: 38. 1906.

Known only from the type collection, gathered on the crest of the Sierra Madre between Michoacán and Guerrero.

Shrub 3 to 4 meters high; branches brown, terete, glabrous; leaves opposite, petiolate, ovate-oblong, acuminate, serrate, at base rounded but with short acumination, feather-veined, glabrous above, slightly woolly on the midrib beneath, about 15 cm. long and a third as wide; petiole 3 cm. long; heads about 10-flowered, long-pedicelcd, nodding in axillary clusters; phyllaries green, linear, attenuate; corollas white.

58. *Eupatorium lucidum* Ortega, Hort. Matr. Dec. 35. 1797.

Eupatorium capnoresbium Robinson, Proc. Amer. Acad. 35: 331. 1900.

Eupatorium glaucum Schultz Bip.; Robinson, Proc. Amer. Acad. 35: 331, 333. 1900. Not *E. glaucum* Schultz Bip. ex Klatt.

Mexico and Federal District; described from Mexican material cultivated in the Botanical Garden in Madrid.

Shrub 1.5 to 3 meters high; branches flexuous, brown or purple, when young densely covered with spreading gland-tipped pubescence; leaves ovate-oblong, acutish or acute, serrate, but entire toward the rounded to acute base, thickish, glossy, distinctly paler beneath, 2.5 to 5 cm. long, about half as wide; petiole 4 to 15 mm. long; corymbs round-topped, rather dense, 4 to 15 cm. in diameter; heads about 10-flowered; phyllaries subequal, lance-linear, acutish, usually purple-tinted; corollas roseate.

59. *Eupatorium ligustrinum* DC. Prodr. 5: 181. 1836.

Eupatorium micranthum Lag. as doubtfully interpreted by Less. *Linnaea* 5: 138. 1830. Probably not *E. micranthum* Lag. Gen. & Sp. Nov. 25. 1816.

Eupatorium semialatum Benth. Pl. Hartw. 76. 1840.

Eupatorium myriadenium Schauer, *Linnaea* 19: 721. 1847.

Eupatorium weinmannianum Regel & Koern. Ind. Sem. Hort. Petrop. 1857: 41. 1857.

Eupatorium biceps Klotzsch; Vatke, Bot. Zeit. 30: 719. 1872. (A brief paper indicating many horticultural synonyms of this species.)

Eupatorium popocatapellense Schlecht.; Hemsl. Biol. Centr. Amer. Bot. 2: 99. 1881.

Eupatorium erythropappum Robinson, Proc. Bost. Soc. Nat. Hist. 31: 248. 1904.

Tamaulipas, San Luis Potosí, Hidalgo, Veracruz, and Chiapas; type from Tamaulipas. Guatemala and Costa Rica.

Attractive shrub 1.2 to 5 meters high; leaves oblong, acuminate, serrately few-toothed, cuneate and often somewhat crisped and revolute toward the base, feather-veined, thickish-membranaceous, mostly 4 to 9 cm. long and 2 to 4 cm. wide, usually beset beneath with glistening globules; corymbs convex, fastigiate, many-headed; heads 4 to 8-flowered; phyllaries linear, gland-dotted, scarcely half the length of the florets; corollas white; pappus often deep rose.

A highly valued greenhouse plant long cultivated under many horticultural names and running into some more or less striking though apparently inconstant forms. Of these the following seems to justify botanical recognition.

59a. *Eupatorium ligustrinum* var. *villiferum* Robinson, Contr. Gray Herb. n. ser. 75: 10. 1925.

Coahuila and San Luis Potosí; type from mountains near Carneros Pass.

Young branches, petioles, etc., spreading-villous as well as finely puberulent; leaves pubescent on both surfaces.

The leaves in this pubescent form show in venation some transition to the following species, being pinnately 5-nerved from above the base rather than regularly pinnate-veined.

60. *Eupatorium saltillense* Robinson, Proc. Amer. Acad. 43: 34. 1907.

Coahuila and Nuevo León; type collection secured at Saltillo.

Opposite-branched shrub 0.9 to 1.5 meters high; leaves ovate, obtuse, undulate to serrate-dentate, the blade decurrent on the upper part of the petiole and there tending to be revolute and ruffled, sparsely or only obsoletely hirtellous, subconcolorous, of firmly membranaceous texture, distinctly 3-ribbed from well above the base, punctate beneath, 4 to 6 cm. long, 2 to 4 cm. wide; corymbs many-headed, convex, 4 to 10 cm. wide, puberulent; heads about 5-flowered; corollas white or pink-tinged; pappus roseate.

Except in its pronouncedly 3-nerved leaves, very close to *E. ligustrinum*, of which it may prove a mere variety.

61. *Eupatorium hederaefolium* A. Gray, Mem. Amer. Acad. n. ser. 4: 65. 1849.

Known only from the type collection, secured at Cosihuiriachi, in the Sierra Madre west of Chihuahua.

Shrub 1 to 1.3 meters high; branches opposite, terete, ascending, slender; branchlets purple; leaves opposite, long-petioled, reniform-ovate, rounded at tip, coarsely crenate, openly cordate at base, about 4 cm. long and wide, paler beneath, membranaceous; heads 10 to 12-flowered, in dense terminal sessile corymbs; phyllaries oblong, crisped-puberulent.

62. *Eupatorium longifolium* Robinson, Proc. Amer. Acad. 36: 480. 1901.

San Luis Potosí and Veracruz; type from Tamasopo Canyon, San Luis Potosí. Suffruticose, 1 meter high; stems slender, terete, covered with fine dark spreading pubescence; leaves opposite, ovate, narrowed from near the base to a caudate-attenuate tip, crenate-serrate at the sides, cordate at base, 3-nerved, thin, dark green above, paler and slightly velvety beneath, 8 to 12 cm. long, 4 to 5 cm. wide; petiole mostly 8 to 16 mm. long; heads 10 to 12-flowered, disposed in a large, leafy-bracted, ovoid or pyramidal panicle; phyllaries linear-attenuate, 3 or 4-nerved, pubescent; corollas greenish white, often with a dull purple tinge.

63. *Eupatorium solidaginoides* H. B. K. Nov. Gen. & Sp. 4: 126. 1820.

Eupatorium filicaule Schultz Bip.; A. Gray, Proc. Amer. Acad. 21: 384. 1886.

Eupatorium stipuliferum Rusby, Mem. Torrey Club 4: 210. 1895.

Ophryosporus solidaginoides Hieron. Bot. Jahrb. Engler 29: 4. 1900.

San Luis Potosí, Veracruz, Oaxaca, and Chiapas. Widely distributed in Central and South America; type collected between Ticsan and Alausi, Ecuador.

A slender, wholly herbaceous or slightly lignescent calciphile with some tendency to climb; leaves opposite, slender-petioled, ovate, caudate-acuminate, the cauline open-cordate and more or less hastate at base, dentate, membranaceous, 5 to 12 cm. long, half as wide, puberulent to subtomentellous on the nerves beneath; heads 10 to 15-flowered, slender-pedicelcd and subracemose on the spreading branches of a large leafy-bracted panicle; phyllaries lanceolate, acute, loosely imbricate, usually purple-tinged.

63a. *Eupatorium solidaginoides* var. *armourii* Robinson, Proc. Amer. Acad. 55: 32. 1919.

Chiapas; known only from the type collection secured at Palenque.

Leaves narrowly triangular, much more decidedly hastate and more deeply crenate-toothed than in the typical form.

A marked variation but inseparable by trustworthy characters.

64. *Eupatorium pseudoperfoliatum* Schultz Bip.; Klatt, Leopoldina 20: 75. 1884.

Veracruz; known only from the original collection made at Consoquitla.

A slender shrub with virgate stems; leaves opposite, ovate, acuminate, crenate-dentate, cordate, so short-petioled as to appear sessile and stem-clasping, membranaceous, 6 to 10 cm. long, 4 to 5 cm. wide, brown-tomentellous on both surfaces; heads about 12 to 14-flowered, shortly pedicelcd at tips of the branches of a loose pyramidal leafy-bracted panicle; phyllaries lanceolate, attenuate, 2 or 3-ribbed, brownish-puberulent.

65. *Eupatorium leucoderme* Robinson, Proc. Amer. Acad. 41: 274. 1905.

Known only from the original collection obtained at Chuta, presumably in Guerrero, altitude 25 meters, in sandy soil.

Shrub with arcuate terete cream-white branches; leaves oblong-lanceolate, caudate-acuminate, serrate to subentire, rounded at base, thin, somewhat puberulent, 5 to 7 cm. long, 2 to 2.5 cm. wide; petiole about 6 mm. long; heads about 6-flowered, in dense, ovoid, lateral or terminal, short-peduncled thyrses; phyllaries lance-linear, less than half as long as the florets; corollas white slender-tubulate.

66. *Eupatorium albicaule* Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 92. 1881, hyponym; Klatt, Leopoldina 20: 89. 1884.

Eupatorium drepanophyllum Klatt, Ann. Naturhist. Hofmus. Wien. 9: 356. 1894.

Veracruz, San Luis Potosí, and Yucatán; type from Papantla, Veracruz.

Tall shrub 3 to 9 meters high; branches flexuous or arcuate, terete, cream-white; branchlets sparingly puberulent to fulvous-tomentellous; leaves smooth,

oblong, falcate-acuminate, serrate to subentire, 3-nerved from above the rounded base, 5 to 12 cm. long, 1.5 to 4 cm. wide, subcoriaceous; petiole mostly 8 to 13 mm. long; heads about 7 or 8-flowered, in dense rounded short-peduncled corymbs; phyllaries lance-linear, acute, much shorter than the florets; corollas tubulate, slender, pale.

67. *Eupatorium ymalense* Robinson, Contr. Gray Herb. n. ser. **75**: 14. 1925.

Eupatorium albicaule var. *laxius* Robinson, Proc. Amer. Acad. **35**: 330. 1900. Sinaloa; type from Ymala.

Tall shrub with firm, light gray bark; leaves opposite, ovate-oblong, acuminate, entire, thin, membranaceous, almost glabrous, 3-nerved from slightly above the rounded base, 7 to 12 cm. long, 3 to 6 cm. wide; petiole slender, 5 to 9 mm. long; panicles pedunculate, lateral and terminal, ovoid, about 6 cm. in diameter; heads pediceled, about 13-flowered, 8 to 10 mm. high; phyllaries linear, attenuate, dorsally puberulent; corollas pale, almost tubular, granulate.

68. *Eupatorium glischrum* Robinson, Proc. Amer. Acad. **54**: 245. 1918.

Known only from the original collection obtained on the summit of the Sierra de Parras, Coahuila.

Glutinous shrub with opposite, ascending, flexuous and nodulose branches; leaves oblong-lanceolate, obtuse, slightly cuspidate at tip, cuneate at base, entire, 3-nerved, glabrous and vernicose on both surfaces, 2 to 3.5 cm. long, 5 to 10 mm. wide; petiole 2 to 6 mm. long; heads 4 to 6-flowered, in small dense convex corymbs scarcely surpassing the leaves; phyllaries narrowly oblong, obtuse; corollas purplish.

69. *Eupatorium areolare* DC. Prodr. **5**: 169. 1836.

Eupatorium tubiflorum Benth. Pl. Hartw. 76. 1841.

Eupatorium brevisetum DC. Prodr. **5**: 169. 1836.

Michoacán and Chiapas; type from the Guachilaca Mountains. Guatemala.

Slender-branched shrub 3 to 5 meters high, shortly purplish-velvety on branchlets, petioles, and inflorescence; leaves opposite, ovate to ovate-oblong or ovate-lanceolate, gradually acuminate to a usually falcate tip, serrate, rounded to shallowly cordate at base, finely areolate above, paler, reticulate, and crisped-pubescent to tomentellous beneath, 6 to 13 cm. long, 3 to 6 cm. wide; petiole 1 to 1.5 cm. long; heads 12 to 20-flowered, in dense rounded terminal and stalked axillary corymbs (much shorter than the leaves); corollas white, with long tubular throat and much exceeding the narrow acute pubescent phyllaries.

70. *Eupatorium brevipes* DC. Prodr. **5**: 168. 1836.

Kyrstenia brevipes Greene, Leaflets **1**: 9. 1903.

San Luis Potosí to Oaxaca, Michoacán, and Durango.

Erect shrub 1.5 to 2.5 meters high with virgate leafy branches; leaves opposite and alternate, shortly petioled, lance-oblong to narrowly oval, acuminate to (rarely) obtuse, crenate-serrate from near the middle outward, 3-nerved, 3 to 8 cm. long, 8 to 25 mm. wide, scabrid-puberulent above, grayish-puberulent to subtomentellous beneath; heads about 20 to 25-flowered, in strongly convex to ovoid corymbs; phyllaries linear, acute, dorsally pubescent; corollas white or nearly so. "Chamiso" (*Seler*).

71. *Eupatorium liebmanni* Schultz Bip.; Klatt, Leopoldina **20**: 75. 1884.

Eupatorium hirsutum DC. Prodr. **5**: 170. Sept. 1836. Not *E. hirsutum* Hook. & Arn. March, 1836.

Eupatorium pseudo-hirsutum Hieron. Bot. Jahrb. Engler **22**: 758. 1897.

Oaxaca and Morelos; type from Planlanito.

Virgate-branched shrub with habit like the preceding but leaves oblanceolate to narrowly oblong, strongly discolorous, canescent-tomentose beneath, and feather-veined instead of 3-nerved; corollas white or pink-tinged.

72. *Eupatorium crassirameum* Robinson, Proc. Amer. Acad. 35: 332. 1900.

Morelos and Veracruz; type from lava fields near Cuernavaca.

Soft-wooded tree 3 to 4 meters high with thick, curved, pale grayish, at anthesis leafless branchlets; leaves opposite, broadly ovate, coarsely and undulately or sinuately few-toothed or angled, shortly acuminate, thin, green and glabrous on both surfaces, 10 to 16 cm. long, 8 to 14 cm. wide; petiole about 5 cm. long; heads about 15-flowered, in dense rounded compound corymbs; phyllaries linear-oblong, subacute; corollas purple.

A species of unique habit.

73. *Eupatorium desquamans* Robinson, Proc. Amer. Acad. 35: 333. 1900.

Known only from the original collection, made on the Sierra de San Felipe, Oaxaca.

A low much-branched shrub; branches flexuous, nodulose, leafy chiefly at the tip; buds and young leaves covered with a silvery-gray membranous coating, this breaking away and desquamating; leaves opposite, ovate, obtuse or obtusish at both ends, crenulate, paler beneath, 1 to 1.8 cm. long, 8 to 11 mm. wide; petiole 3 to 5 mm. long; heads about 15-flowered, in racemiform corymbs; phyllaries linear, acute, purplish brown, densely beset with sessile glands.

A little known species, probably rare and local.

74. *Eupatorium rupicola* Robins. & Greenm. Proc. Amer. Acad. 32: 42. 1896.

Oaxaca; the original collection obtained on dry ledges of the Sierra de San Felipe.

Branching hard-wooded shrub 1.5 to 3 meters high; branchlets slender, purple or brown, leafy, covered with a fine dark incurved puberulence; leaves opposite, petiolate, ovate, acuminate, crenate-serrate, rounded at base, green and smoothish above, somewhat paler, very finely dark-reticulate and on the nerves and larger veins pubescent to tomentellous beneath, 25 to 40 mm. long, 16 to 24 mm. wide; petiole 6 to 8 mm. long; corymbs terminal and on short lateral branchlets, together disposed in elongate leafy-bracted panicles; heads about 16-flowered; phyllaries oblong, obtuse, smoothish, not half as long as the florets; corollas purplish white; achenes subsericeous.

Another well marked and probably very local species, as yet but slightly known.

75. *Eupatorium viburnoides* DC. Prodr. 5: 171. 1836.

Tamaulipas and Nuevo León; type from gorges of the valley of Palmilla, between Victoria and Tula.

Shrub 1 to 2.4 meters high, sparingly arachnoid-tufted on buds, petioles, axils of leaves, etc.; leaves opposite, large, obovate, obtuse to subacute, cuneate at base, few-toothed to entire, coriaceous, on thick short petioles; heads about 15-flowered, in rather dense corymbs; phyllaries linear-oblong, rounded at tip, smoothish; corollas violet (*Berlandier*).

76. *Eupatorium tetragonum* Schrad. Ind. Sem. Hort. Gott. 1830; Linnaea 6: Litt. Ber. 72. 1831.

Known only from material cultivated at Goettingen from seeds said to have been procured by Schiede in Mexico.

Said to be suffruticose; stem smooth, erect, weak; branches tetragonal, slightly pubescent toward the summit; leaves opposite, rhombic-ovate, acuminate, serrate except toward the obtusely pointed base, thinly membranaceous, smoothish above, sparingly pubescent beneath, green on both surfaces, 7 to 11 cm. long, 3 to 5.5 cm. wide; petiole 2.5 to 3 cm. long; heads 12 to 15-flowered; phyllaries linear, attenuate; corollas white; pappus scarcely more than half as long as corolla.

- 77. *Eupatorium adenochaenium*** Schultz Bip.; Klatt, *Leopoldina* 20: 75. 1884.

Eupatorium adenochaetum Schultz Bip.; Hemsl. *Biol. Centr. Amer. Bot.* 2: 91. 1881; doubtless through clerical or typographical error and without character.

Eupatorium adenachenium Schultz Bip.; Hook. f. & Jacks. *Ind. Kew.* 1: 915. 1893; also by error.

Veracruz; type from Mount Orizaba.

Shrub with branches subterete and when young clothed with a dull rusty pubescence; leaves opposite, lance-oblong (rather than triangular-ovate as originally described), acuminate at tip, acute at base, coarsely serrate at sides, 6 to 8 cm. long, 2.5 to 3 cm. wide, thickish, darkening in drying; petiole about 5 mm. long; corymbs terminal, convex, 15 cm. wide; heads about 12-flowered, pediceled; phyllaries lance-oblong, obtuse, densely short-pubescent and atomiferous; achenes beset with sessile glands, especially on the angles.

- 78. *Eupatorium brandegeanum*** Robinson, *Contr. Gray Herb. n. ser.* 68: 10. 1923.

San Luis Potosí; type from Minas de San Rafael.

A slender, openly branched and crisped-puberulent shrub; leaves opposite, ovate, obtuse, crenate, truncate or shallowly cordate at base, membranaceous, 25 to 46 mm. long, 15 to 26 mm. wide; petiole 4 to 5 mm. long; heads 12 to 18-flowered, in loose corymbs; pedicels covered with stipitate dark glands; phyllaries green, lance-linear, acute.

- 79. *Eupatorium glabratum*** H. B. K. *Nov. Gen. & Sp.* 4: 127. 1820.

Eupatorium xalapense H. B. K. *Nov. Gen. & Sp.* 4: 128. 1820.

Vernonia toluccana DC. *Prodr.* 5: 30. 1836.

Eupatorium gonocladum DC. *Prodr.* 5: 171. 1836.

San Luis Potosí, Hidalgo, Veracruz, Puebla, Mexico, and Federal District; type from Real del Monte, Hidalgo.

Smoothish but viscid shrub 1 to 2.5 meters high; stem subterete, buff to brown; branches ascending, more or less angled; leaves ovate- to rhombic-oblong, obtuse to acute, serrulate to entire, cuneate at base, green above, pale beneath, 2.5 to 6 cm. long, half as wide, slightly fleshy, commonly proliferous in the axils; heads about 15 to 18-flowered, pedicellate in opposite-branched leafy-bracted elongate fastigate terminal panicles; phyllaries oblong, acutish, puberulent, often purple-tinged; corollas pale pink. "Hillo" (*Purpus*); "hierba del golpe" (*Ehrenberg*, who states that steam from a decoction of this plant cures sprains).

A conservatory plant long cultivated for ornament.

- 80. *Eupatorium subintegrum*** (Greene) Robinson, *Contr. Gray Herb. n. ser.* 75: 13. 1925.

Eupatorium espinosarum var. *subintegrifolium* Robinson, *Proc. Amer. Acad.* 26: 165. 1891.

Kyrstenia subintegra Greene, *Leaflets* 1: 10. 1903.

San Luis Potosí; type from shaded ledges of limerock, San José Pass.

Shrubby, vernicose and viscid, especially on the younger parts; stems terete; branches opposite, ascending, flexuous, finely crisped-puberulent toward the tips; leaves deltoid-ovate, subentire, acuminate, subtruncate at base, subcoriaceous, 3 to 5 cm. long, 2 to 3 cm. wide; petiole 5 to 9 mm. long; corymbs (often numerous) round-topped, rather dense, 3 to 5 cm. broad; heads slender, 8 to 12 mm. long; phyllaries linear-attenuate.

81. *Eupatorium espinosarum* A. Gray, Proc. Amer. Acad. 15: 28. 1879.

Eupatorium spiraeaefolium Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 101. 1881, nomen nudum.

Kyrstenia espinosarum Greene, Leaflets 1: 9. 1903.

Eupatorium spiraeaefolium Schultz Bip.; Loesener, Bull. Herb. Boiss. 3: 624. 1895.

Shrub 1 to 1.5 meters high, always somewhat vernicose and viscid, especially on the involucre, the older branches often blackened; leaves opposite, petiolate, firmly membranaceous to subcoriaceous, chiefly triangular-ovate but varying to rhombic-ovate, obtuse to more often acute or acuminate, mostly subtruncate at base, 2 to 3.8 cm. long, 1 to 2.5 cm. wide, bright green above, scarcely paler and finely dark-reticulate beneath; petiole 5 (to 10) mm. long; corymbs many, 4 to 5 cm. wide, convex; heads about 13-flowered; phyllaries oblong to elliptic, gummy and often yellowish.

81a. *Eupatorium espinosarum* var. *doratophyllum* Robinson, Contr. Gray Herb. n. ser. 75: 6. 1925.

Eupatorium robinsonianum Greene, Erythea 1: 150. 1893.

Jalisco and Hidalgo; type from canyon walls near Lake Chapala.

A slightly gummy shrub differing from the typical form in having lanceolate rather than ovate leaves 2.5 to 3 cm. long and 9 to 13 mm. wide, rounded rather than subtruncate at base.

82. *Eupatorium hebes* Robinson, Contr. Gray Herb. n. ser. 75: 7. 1925.

Southern Mexico, presumably Veracruz; type from "Mecatlan, St. Andrés."

Shrub assuming (at least in dried specimens) a dull yellowish brown color; subterete branches and hexagonal branchlets as well as pedicels and phyllaries closely beset with short spreading gland-tipped bristles; leaves opposite, petiolate, broadly oval, rounded at tip, subentire, scarcely pointed at the base, 2 to 3.3 cm. long, nearly as wide; corymbs 6 to 9 cm. in diameter; phyllaries lanceolate, acute, dorsally glandular-puberulent.

82a. *Eupatorium hebes* var. *rasum* Robinson, Contr. Gray Herb. n. ser. 75: 8. 1925.

With the typical variety.

Differing in having the branches somewhat more definitely angled and, as well as the branchlets, pedicels, phyllaries, etc., quite free from the spreading bristles characteristic of the typical variety.

83. *Eupatorium havanense* H. B. K. Nov. Gen. & Sp. 4: 128. 1820.

Eupatorium leiophyllum Less. Linnaea 6: 402. 1831.

Eupatorium berlandieri DC. Prodr. 5: 167. 1836.

Eupatorium ageratifolium DC. Prodr. 5: 173. 1836.

Eupatorium ageratifolium β. ? *mexicanum* DC. Prodr. 5: 173. 1836.

Eupatorium ageratifolium β. *texense* Torr. & Gray, Fl. N. Amer. 2: 90. 1841.

Bulbostylis deltoides Buckley, Proc. Acad. Philad. 1861: 456. 1861.

Eupatorium texense Rydb. Fl. Colo. 335. 1906.

Coahuila, Nuevo León, Tamaulipas, San Luis Potosí, and Veracruz. Texas, Cuba, and Bahamas.

A neat shrub 1 to 2 meters high, smoothish to more often puberulent; stems and ascending branches terete; leaves opposite, petiolate, of firm texture and subcoriaceous, deltoid- to rhombic-ovate, 3-nerved from base, acute, coarsely crenate-dentate to obscurely serrate or subentire, 3 to 5 (or 8) cm. long, 1.2 to 3 (or 4) cm. wide; corymbs convex; heads at full maturity about 1 cm. long, well pediceled; phyllaries green to purplish, linear, acute; pappus white to roseate; corollas white or nearly so.

An abundant species, somewhat variable as to leaf form, dentation, degree of pubescence, etc., yet without well-marked varieties.

84. *Eupatorium gracilicaule* Schultz Bip.; Robinson, Proc. Amer. Acad. 42: 39. 1906.

Veracruz or Oaxaca; type from Tlacolula.

Shrub 3 meters high with slender terete smooth stems and opposite curved-ascending branches; leaves ovate, falcate-acuminate, crenate-serrate, rounded or scarcely pointed at base, membranaceous, smoothish, glandular-punctate beneath, 8 cm. long, 3 to 4 cm. wide, the veinlets slightly translucent; petiole slender, 2 to 2.5 cm. long; corymbs rather open, sometimes combined into large leafy-bracted panicles; heads about 13-flowered, slender-pedicelcd; phyllaries linear, attenuate, dorsally pubescent and atomiferous.

85. *Eupatorium mairetianum* DC. Prodr. 5: 167. 1836.

Eupatorium lasioneuron Hook. & Arn. Bot. Beechey Voy. 297. 1840.

Eupatorium cognatum Kunth & Bouché, Ind. Sem. Hort. Berol. 1847: 13. 1847.

Michoacán, Federal District, Morelos, and Oaxaca. Guatemala.

Shrub 1 to 4.5 meters high, more or less arachnoid-tufted on younger parts and especially in axils of the veins on lower surface of leaf; stems terete, brown with white pith; leaves opposite, ovate to rhombic, acuminate, serrate except toward the more often acute base, 6 to 11 cm. long, 3 to 5 cm. wide, of firm texture, green and glabrous above, much paler and more or less pubescent beneath; corymbs usually disposed in ovoid leafy-bracted terminal thyrses; heads about 25-flowered, 12 to 16 mm. high; phyllaries linear, attenuate, pubescent.

86. *Eupatorium subpenninervium* Schultz Bip.; Klatt, Leopoldina 20: 89. 1884.

Eupatorium melanolepis Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 97. 1881, nomen nudum; Klatt, Leopoldina 20: 89. 1884.

Eupatorium subinclusum Klatt, Leopoldina 20: 75. 1884.

Eupatorium oxylepis Schultz Bip.; Klatt, Leopoldina 20: 75. 1884. Not *E. oxylepis* DC.

Oaxaca, Puebla, and Chiapas; type from Cumbre de Ectapa.

Shrub 1.5 to 6 meters high, covered on young branches, petioles, etc., with a dark violet or at length rusty tomentum; leaves opposite, petiolate, ovate, acuminate, crenate-serrate, acute to rounded or rarely subcordate at base, pubescent on both surfaces, deep green above, paler beneath, of soft membranaceous texture, 5 to 12 cm. long, 4 to 8 cm. wide, pinnately nerved from above the base; petiole 2 to 4.5 cm. long; corymbs terminal, compound, 6 to 16 cm. in diameter; heads 17 to 24-flowered; phyllaries dark violet, linear, obtuse to acute, 4 to 5 mm. long, only half the length of the florets; corollas purple.

87. *Eupatorium vernale* Vatke & Kurtz, Ind. Sem. Hort. Berol. 1871: Append. 2. 1871; Gartenflora 1873: 36. 1873.

Described from cultivated material thought to have been of Mexican origin.

Shrub, or tall, slightly lignescent herb, in habit similar to the preceding but covered with a much looser, villous or tomentose pubescence of pale spreading hairs; leaves acuminate, coarsely serrate-dentate; phyllaries green, at maturity 7 to 10 mm. long, attenuate.

88. *Eupatorium chiapense* Robinson, Proc. Amer. Acad. 35: 332. 1900.

Chiapas and Morelos; also on crest of the Sierra Madre between Michoacán and Guerrero; type collected near Pinabete, Chiapas.

A shrub 3 meters high; stems terete, densely clothed with purple or at length rusty tomentum; leaves opposite, oblong-ovate, acuminate to (rarely) obtuse, serrate, rounded, subcordate, or (rarely) obtusely pointed at base, pinnately nerved from well above the base, pubescent on both surfaces, 6 to 14 cm. long, 5 to 8 cm. wide, membranaceous; petiole 2 to 6 cm. long; corymbs ample, convex,

6 to 20 cm. wide, closely beset with stipitate glands; heads 10 to 24-flowered; phyllaries linear, attenuate, purple, gland-dotted.

Some specimens from Zacuapan in the State of Veraacruz (*Purpus* 7078) appear to be only a much smoother form of this species.

89. *Eupatorium hidalgense* Robinson, Contr. Gray Herb. n. ser. 75: 8. 1925.

Hidalgo; type from Sierra de Pachuca.

Shrub 1 to 1.5 meters high; stems and spreading branches terete, dark gray to almost black; branchlets dark purple, crisped-puberulent; leaves opposite, rhombic-oblong, narrowed to an obtuse or rounded tip, subcuneate at base, entire or nearly so, essentially glabrous, green above, pale and dark-punctate beneath, 1.5 to 3 cm. long, 1 to 1.5 cm. wide; petiole 2 to 5 mm. long; corymbs terminal, rather dense, flattish to distinctly convex, 3 to 6 cm. wide, often numerous and combined into a compound leafy inflorescence; heads 8 to 10 mm. high; phyllaries linear, narrowed to an obtuse tip, green or purple-tinged, not half the length of the florets; corollas white; pappus usually purplish toward the base.

90. *Eupatorium rhomboideum* H. B. K. Nov. Gen. & Sp. 4: 127. 1820.

Eupatorium calaminthaefolium β *pluridentatum* DC. Prodr. 5: 171. 1836.

Mexico and Federal District; type collected between Tianguillo and Toluca.

Shrub 0.9 to 1.5 meters high; stems and ascending branches round; branchlets somewhat hexagonal, puberulent; leaves opposite, rhombic-ovate, obtusish, crenate except toward the cuneate to obtuse base, puberulent, 3-nerved, 2 to 3 (or 5) cm. long, 1.5 to 2.5 (or 3.5) cm. wide; corymbs multiple or dense, strongly convex to ovoid; heads about 1 cm. high; phyllaries oblong-lanceolate, acute, pubescent; corollas much exerted, purple-tinged.

91. *Eupatorium irrasum* Robinson, Contr. Gray Herb. n. ser. 75: 8. 1925.

Eupatorium calaminthaefolium var. *irrasum* Robinson, Contr. Gray. Herb. n. ser. 68: 11. 1923.

Oaxaca and Puebla; type from the Cordillera of Oaxaca.

A rather densely branched shrub; leaves very small, ovate, obtuse, serrate, conspicuously discolorous, puberulent and dull green above, canescent-tomentose beneath, only 7 to 10 mm. long and 4 to 7 mm. wide; corymbs numerous, few-headed; phyllaries lance-linear, acute, mostly purple-tinged, densely pubescent; corollas purple.

92. *Eupatorium porriginosum* Robinson, Contr. Gray Herb. n. ser. 75: 11. 1925.

Hidalgo, Federal District, and Oaxaca; type from bluffs of a barranca above Metepec Station, Hidalgo.

Copiously branched, small-leaved shrub 0.9 to 1.5 meters high; stems terete, at length glabrous; branches and branchlets crisped-puberulent; leaves opposite, oval, entire or nearly so, obtuse to rounded at each end, membranaceous, slightly paler beneath, sparingly puberulent and punctate on both surfaces, nearly always slightly mottled on the upper as if obscurely lepidote, 1 to 2 cm. long, 7 to 15 mm. wide; corymbs few-headed, umbelliform, numerous; pedicels 1 to 1.8 cm. long, often exceeding the heads; phyllaries narrowly lanceolate, about half the length of the florets; corollas purple or white.

93. *Eupatorium wrightii* A. Gray, Pl. Wright. 1: 87. 1852.

Kyrstenia parvifolia Greene, Leaflets 1: 12. 1903.

Chihuahua, Coahuila, and San Luis Potosí. Texas.

Much-branched grayish-puberulent or -pulverulent shrub 20 to 60 cm. high; stems terete; cortex gray; leaves opposite, broadly oval, rounded to subacute at apex, mostly rounded at base, entire or nearly so, membranaceous to chartaceous, the cauline 1.8 to 3 cm. long, nearly as wide, the rameal often very numerous and much smaller; corymbs small but numerous, often forming irregular compound inflorescences; heads about 12-flowered; phyllaries lance-oblong, acute, green; corollas white.

94. *Eupatorium calophyllum* (Greene) Robinson, Contr. Gray Herb. n. ser. 75: 5. 1925.

Kyrstenia calophylla Greene, Leaflets 1: 11. 1903.

Coahuila, San Luis Potosí, and Hidalgo; type from Saltillo.

A low caespitose shrub 15 to 30 cm. high; stem decumbent or even prostrate and subrepent, sending up erect branches; leaves opposite, suborbicular, varying to ovoid or broadly elliptical, about 1.5 to 2 cm. in diameter, crenate, thick, coriaceous, concolorous, minutely scrobiculate beneath, the glandular punctation tending to follow the yellowish green network of fine veinlets; petiole 3 to 6 mm. long; corymbs mostly 3 to 5 cm. wide; heads about 12-flowered; phyllaries oblong, acute, often purple-tinged, scarcely half as long as the florets; corollas purple.

95. *Eupatorium calaminthaefolium* H. B. K. Nov. Gen. & Sp. 4: 129. 1820.

Coahuila, San Luis Potosí, Guanajuato, and Hidalgo; type from Santa Rosa de la Sierra, near Guanajuato.

Habitally similar to the preceding, but taller; leaves membranaceous or at most chartaceous, sparingly puberulent, not scrobiculate, the glandular dots on the surface of the areolae rather than on the netted veinlets; phyllaries oblong, mostly obtuse.

In the past this species, very broadly interpreted, has been made to include several now pretty readily distinguishable species.

96. *Eupatorium glaucum* Schultz Bip.; Klatt, Leopoldina 20: 89. 1884.

Not *E. glaucum* Schultz Bip.; A. Gray in Hemsl. Biol. Centr. Amer. Bot. 2: 95. 1881. See Robinson, Proc. Amer. Acad. 35: 333. 1900.

Eupatorium orizabae Schultz Bip.; Klatt, Leopoldina 20: 90. 1884.

Vera Cruz and Oaxaca; type from Pelado.

Low sprawling many-branched alpine undershrub, sordid-pubescent and glandular; leaves opposite (the uppermost sometimes ternate or scattered and alternate), subsessile, elliptic-oblong, thick, coriaceous, 1 (or 3)-nerved, revolute at margin, 1 to 1.6 cm. long, 3 to 7 mm. wide; corymbs few-headed, 3 to 4 cm. wide; phyllaries oblong, mostly obtuse, nerveless, purple-tinged; corollas purple.

97. *Eupatorium rhodopodum* Robinson, Contr. Gray Herb. n. ser. 75: 12. 1925.

San Luis Potosí; type from Minas de San Rafael.

Shrub 40 cm. or more in height, sparingly dark-villous on the younger parts, otherwise glabrous; stems terete and branches nearly so; leaves opposite, subsessile, broadly ovate to ovate-oblong, obtuse to barely acute, rounded to subcordate at base, slightly undulate-dentate, thick, coriaceous, 2 to 3 cm. long, 1.4 to 2.5 cm. wide, green and glabrous on both surfaces, not punctate, the very short petiole thick, often reddish purple; corymbs terminal, 3 to 6 cm. wide; heads long-pedicelled; phyllaries lance-oblong, acute, ciliate, often purple-tinged; pappus bright rose-color.

98. *Eupatorium mygindaefolium* A. Gray, Proc. Amer. Acad. 16: 101. 1880.

Bigelovia oppositifolia A. Gray, Proc. Amer. Acad. 15: 32. 1879. Not *Eupatorium oppositifolium* Hoffmannsegg.

San Luis Potosí; type from ravine in cool mountains near San Miguel.

Low, much branching, sprawling, vernicose undershrub; stems nodose, fuscous; leaves oblong, acute or acutish at each end, few-toothed above the middle, about 14 mm. long, 6 mm. wide, coriaceous, green and often gummy on both surfaces; heads subsolitary at ends of the branches, at maturity 12 to 14 mm. long, surrounded by foliaceous bracts.

99. *Eupatorium campylocladum* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 247. 1904.

Coahuila; type from General Cepida.

Pliant-stemmed shrub with dark gray cortex; branches flexuous, nodulose (the internodes mostly very short), denuded of leaves except near the tip; leaves ovate-suborbicular, obtuse, serrate, shallowly cordate at base, about 2 cm. long and 1.7 cm. wide, glabrous but gummy on both surfaces; petiole 5 to 7 mm. long; heads 1 to several at tips of branches, about 13 mm. long; phyllaries oblong, acute, thin, green, glandular-puberulent.

100. *Eupatorium vernicosum* Schultz Bip.; Greenm. Zoe 5: 186. 1904.

Mexico; type (i. e., plant described by Greenman) from rocks near timber line on Mount Ixtaccihuatl.

Low shrub with forking nodulose blackish stems and branches; leaves opposite, ovate, shortly acuminate, serrate, rounded to shallowly cordate at base, gummy and very viscid on both surfaces, chartaceous or subcoriaceous, 3 to 6 cm. long, 1.5 to 4 cm. wide; heads mostly 1 to 5 at the ends of the branches, 1.5 cm. long and equally broad, long-pedicelled.

101. *Eupatorium multiserratum* Schultz Bip. in Seem. Bot. Voy. Herald 301. 1856.

Type locality vaguely stated as Sierra Madre, but species rediscovered by Dr. Palmer in Durango.

Tall shrub with terete stems, long internodes, and ascending branches; leaves opposite, ovate to ovate-oblong, acute to obtuse at tip, sharply serrulate, rounded at base, thickish-membranaceous, tufted in the axils of the chief veins beneath, 3.5 to 5.5 cm. long, 1.8 to 2.7 cm. wide; petiole 1 to 1.3 cm. long; corymbs loose, few-headed, umbelliform; heads 1 to 1.2 cm. long, about 32-flowered; phyllaries smoothish, lance-linear, attenuate, nearly equaling the florets.

102. *Eupatorium hyssopinum* A. Gray, Proc. Amer. Acad. 15: 28. 1879.

Eupatorium koelliaefolium Greene, Pittonia 3: 31. 1896.

Kyrstenia koelliaefolia Greene, Leaflets 1: 9. 1903.

San Luis Potosí, Durango, and Chihuahua; type probably from the region of San Luis Potosí.

Erect-stemmed, essentially herbaceous perennial but sometimes developing a decidedly woody base in age; stems terete, 30 to 60 cm. high, bearing almost from base to summit many slender ascending branches; leaves lanceolate, acute or obtuse at apex, cuneate at the sessile base, ciliolate, otherwise nearly glabrous, 12 to 22 mm. long, 3 to 6 mm. wide, membranaceous; corymbs terminal, moderately convex, 6 to 14 cm. in diameter; corollas white.

103. *Eupatorium riparium* Regel, Gartenflora 1866: 324. 1866.

Eupatorium flexicaule Schnittspahn, Zeitschr. Gartenb. Ver. Darmstadt 6: Anlage 2: 5. 1857, without diagnosis.

Eupatorium riparium Schultz Bip.; Schnittspahn, loc. cit. 1857, also without diagnosis.

Eupatorium harrisii Urban, Symb. Antill. 1: 460. 1900.

Slender, nearly herbaceous plant with terete, flexuous, finely pubescent, at length somewhat lignescent stems; leaves opposite, lanceolate, attenuate to each end, serrate from near the middle outward, 3-nerved from somewhat above the base, 5 to 10 cm. long, 1 to 2.5 cm. wide, sparingly pubescent on the nerves; corymbs numerous, small, paniced; phyllaries pale green, lanceolate, scarious-edged; corollas white.

A copious bloomer, easily grown and long valued in hothouse cultivation. In giving this species its first valid publication, Regel in no way alludes to its earlier though invalid mention in print, which therefore does not give ground for use of Schultz's name as authority.

104. *Eupatorium tomentellum* Schrad. Ind. Sem. Hort. Gott. 1833: 3. pl. 3. 1833.

Eupatorium smithii Robinson, Proc. Amer. Acad. 35: 340. 1900.

Oaxaca and Puebla. Guatemala.

Rusty-tomentellous shrub 0.9 to 1.5 meters high, with curved or flexuous, more or less hexagonal branches; leaves deltoid-ovate (rarely ovate-oblong), rounded at the apex and at the basal angles, crenulate, shallowly cordate at base, gray-green and pulverulent above, rusty-tomentellous beneath, 2 to 5 cm. long, equally wide; corymbs convex, leafy-bracted at base, 4 to 6 cm. in diameter; phyllaries narrowly oblong, acute, green, often purple-tinged, gray-tomentellous; corollas purple.

105. *Eupatorium loesenerii* Robinson, Proc. Amer. Acad. 35: 336. 1900.

Oaxaca; type from calcareous hills at Las Sedas.

Similar to the preceding, but taller, 1.5 to 2.5 meters high; cortex buff to gray; tomentum on young parts and lower leaf surface very rusty; leaves round-ovate, entire or obscurely denticulate, broadly rounded at tip, abruptly pointed to rounded or shallowly cordate at base, ochraceous-tomentellous beneath, 3 to 7 cm. long; petiole 1.5 to 3.5 cm. long; corymbs usually 9 to 13 cm. wide; phyllaries oblong, obtuse, ochraceous, gland-dotted.

106. *Eupatorium malacolepis* Robinson, Proc. Amer. Acad. 44: 618. 1909.

Durango and Tepic; type from San Ramón.

Nearly herbaceous, lignescent only toward the base; stem decumbent, 0.3 to 1.2 meters high, terete, brown, bristling with spreading articulate rusty-brown hairs; leaves opposite, ovate, acuminate, serrate except toward the obtuse to rounded base, membranaceous; inflorescence compound, somewhat irregular, the individual corymbs rather dense, 3 to 5 cm. wide; heads about 4 to 4.5 mm. high; phyllaries oblong, obtuse, green, subscarios, erose, dorsally tomentellous.

107. *Eupatorium conspicuum* Kunth & Bouché, Ind. Sem. Hort. Berol. 1847: 13. 1847; Ann. Sci. Nat. III. 9: 315. 1848.

Eupatorium grandifolium Regel, Gartenflora 1: 102. pl. 12. 1852.

Kyrstenia grandifolia Greene, Leaflets 1: 9. 1903.

Oaxaca and Morelos; originally described from material cultivated at Berlin and stated to have come from Mexico. Guatemala.

Seemingly herbaceous or nearly so, but reported to become a shrub about 2 meters in height; branchlets hexagonal; leaves deltoid-ovate, acute to acuminate, serrate (usually rather sharply so) even to the abrupt acumination at the point of attachment, thin, green on both surfaces, 7 to 12 cm. long and wide; petiole 5 to 12 cm. long, winged at summit; corymbs terminal and subterminal, rather loose, often exceeded by the surrounding foliage; heads about 40-flowered, 5 to 7 mm. high; phyllaries lanceolate, acute, green, pubescent; corollas white.

- 107a. *Eupatorium conspicuum* var. *pueblense* Robinson, Contr. Gray Herb. n. ser. 68: 12. 1923.

Puebla; type from rocky slopes, Boca del Monte.

Stems terete to the inflorescence; leaves with basal acumination entire.

108. *Eupatorium oligocephalum* DC. Prodr. 5: 166. 1836.

Eupatorium erythrocomum Robinson, Proc. Amer. Acad. 43: 31. 1907.

State of Mexico; type recorded merely as from Mexico, where collected by Haenke; the species apparently rediscovered on steep slopes of Mount Ixtacihuatl by Dr. Purpus.

Suffrutescent; stems several, branching, curved-ascending, slender and at most fruticulose, dark purple, finely pubescent; leaves opposite, ovate-lanceolate, acute, serrulate, rounded at base, thickish-membranaceous, green and glabrous above, dark purple and sparingly pubescent on the nerves beneath, 1 to 3 cm.

long, half as wide; petioles 2 to 5 mm. long; corymbs umbelliform, terminal, lax, mostly 3 to 5-headed; heads 25 to 30-flowered, about 1 cm. high; phyllaries oblong, acute, the outer dark purple, originally described as glabrous, but apparently in conspecific material thinly villous; pappus roseate.

109. *Eupatorium aschenbornianum* Schauer, *Linnaea* **19**: 720. 1847.

Eupatorium donnell-smithii Coulter, *Bot. Gaz.* **16**: 95. 1891.

Eupatorium donnell-smithii var. *parvifolium* Coulter, *Bot. Gaz.* **16**: 96. 1891.

Kyrstenia donnell-smithii Greene, *Leaflets* **1**: 9. 1903.

Veraeruz, Puebla, Michoacán, and Mexico; type from the valley of Toluca. Central America.

Described as shrubby, but apparently a scarcely lignescent perennial herb, 30 to 60 cm. high, copiously spreading-pubescent, the trichomes moniliform with dark purple nodes; stems terete, with white pith; leaves suborbicular-ovate, acuminate, serrate, obtuse to rounded or distinctly cordate at base, softly membranaceous, 3 to 8 cm. long, 2.5 to 6.5 cm. wide; petiole 1 to 3 cm. long; corymbs compound, terminal, often 30 cm. broad; heads 20 to 40-flowered; phyllaries linear, subscarios, lacerate-ciliate toward tip; corollas white or nearly so, hispid near the limb.

Specimens apparently belonging to this species have been confidently referred by Schultz-Bipontinus (in herb.), Klatt (in herb.), and Hemsley (*Biol. Centr. Amer. Bot.* **2**: 93. 1881) to the earlier and little known *E. ciliatum* Less., but the latter species is shown by its type to have smaller, relatively shorter-petioled and more incisedly toothed leaves with a short but sharp basal acumination. It is described by Lessing (*Linnaea* **6**: 404. 1831) as herbaceous and as having glabrous corollas.

110. *Eupatorium etlense* Robinson, *Contr. Gray Herb. n. ser.* **75**: 6. 1925.

Type from Las Sedas, Distrito de Etla, Oaxaca, altitude 1,900 meters.

Slender-branched shrub; stems terete, smooth, grayish buff; branches when young slightly hexagonal and puberulent, soon glabrate; leaves opposite, slender-petioled, ovate, obtuse to subacuminate, crenate-serrate, rounded or subcordate at base, 2.5 to 6 cm. long, 2 to 4.3 cm. wide, sparingly puberulent above, pubescent beneath, chartaceo-membranaceous, the closely netted veinlets beautifully translucent; corymbs terminal, rounded; heads about 23-flowered, 8 mm. high; phyllaries in about 3 series, gray-pubescent; corollas white.

111. *Eupatorium scorodonioides* A. Gray, *Proc. Amer. Acad.* **15**: 27. 1879.

Eupatorium scorodonioides var. *grossedentatum* Robinson, *Proc. Amer. Acad.* **35**: 340. 1900.

Central Mexico from Coahuila to Veraeruz and Zacatecas; type from rocky hills near San Luis Potosí.

A hard-wooded shrub 0.9 to 1.8 meters high, copiously and usually fastigiately branched, grayish-tomentellous to -tomentose; leaves opposite, deltoid, cordate, acute or acutish, finely or coarsely crenate-dentate, paler beneath, 3-nerved from the base, 1.5 to 5 cm. long, rarely over 3 cm. wide; petiole mostly less than 1 cm. long; heads about 1 cm. high, long-pedicel, in fastigiate corymbs; phyllaries lance-linear to linear, attenuate, herbaceous, gray-pubescent, nearly equaling the florets; corollas white.

112. *Eupatorium petiolare* Moc.; DC. *Prodr.* **5**: 166. 1836.

Bustamenta cordata Alamán; DC. *Prodr.* **5**: 166. 1836.

Widely distributed from Coahuila and Tamaulipas to Oaxaca.

Shrub 0.9 to 1.5 meters high, with terete, thickish, pithy, and brittle stems; cortex when young tomentellous; leaves opposite, triangular-ovate to suborbicular-ovate, acuminate, crenate-dentate, mostly cordate at base, 6 to 10 cm. long and 4 to 7 cm. wide; petiole mostly 2 to 6 cm. long; corymbs dense, often lateral as

well as terminal, little if at all exceeding the surrounding leaves; heads about 1 cm. long; phyllaries linear, attenuate, pale green, pubescent.

Occasionally approaching the preceding species but in most cases readily separable. "Yoyochichil" (*Seler*).

113. *Eupatorium pringlei* Robins. & Greenm. Amer. Journ. Sci. III. 50: 152. 1895.

Oaxaca and Chiapas; type from Sierra de San Felipe, Oaxaca.

Shrub 2 to 3.6 meters high; stems terete, buff; leaves opposite, petiolate, deltoid-ovate, acute to acuminate, crenate-dentate except at the subtruncate base, obscurely pulverulent-puberulent, paler beneath, about 4 to 5 cm. long and 3 to 4 cm. wide; petiole 1 to 1.5 cm. long; inflorescence ovoid and dense or forming a long loose leafy-bracted terminal thyrse; heads 10 to 12 mm. long; phyllaries linear, acute, brownish purple; corollas white to purple-tinged.

114. *Eupatorium chapalense* S. Wats. Proc. Amer. Acad. 26: 138. 1891.

Jalisco and Durango; type from mountains about Lake Chapala, Jalisco.

Shrub with slender, flexuous, terete, brownish purple branches; leaves opposite, petiolate, ovate, acute, serrate, scarcely pointed or distinctly acuminate at base, sparingly puberulent above, woolly along the nerves beneath, 6 to 9 cm. long, 3 to 4 cm. wide; corymbs terminal, fastigiate; heads 10 to 12 mm. long, almost as broad; phyllaries thin, green or purple-tinged, oblanceolate, acute, pubescent, nearly equaling the florets; corollas white or nearly so; pappus double, of many long inner capillary bristles and a few much shorter, slightly flattened and almost scalelike outer ones.

114a. *Eupatorium chapalense* var. *salicifolium* Robinson, Proc. Amer. Acad. 35: 332. 1900.

Jalisco; type from mountains about Lake Chapala.

Leaves actually and relatively much narrower than in the typical form, lanceolate, 5 to 6 cm. long, about 1.5 cm. wide, pointed at base.

115. *Eupatorium tuerekheimii* Klatt (as *Türkheimii*), Leopoldina 20: 95. 1884.

Chiapas. Guatemala and Honduras.

Scarcely shrubby, 2 meters high, smooth throughout; leaves opposite, lanceolate or lance-oblong, caudate-acuminate, cuspidate-denticulate, pinnate-veined, with thickened margin; heads about 50-flowered, long-pedicel in terminal, rounded-somewhat umbelliform corymbs; phyllaries well imbricate, lanceolate, acute.

116. *Eupatorium ehrenbergii* (Schultz Bip.) Hemsl. Biol. Centr. Amer. Bot. 2: 94. 1881. (Defined by one previously published though not name bringing synonym.)

Eupatorium ehrenbergii Klatt, Flora 68: 202. 1885.

Hebeclinium macrocephalum Benth. Pl. Hartw. 42. 1840. Not *Eupatorium macrocephalum* Less.

Eupatorium benthamii Klatt, Leopoldina 20: 90. 1884.

Kyrstenia benthami Greene, Leaflets 1: 9. 1903.

Known only from Puente de Dios in South Mexico, where long ago collected both by Hartweg and by Ehrenberg.

Suffruticose; stem terete; branches canescent-tomentose; leaves opposite, petiolate, scabrid above, soft-tomentose beneath, serrulate, pinnate-veined; heads about 50-flowered, 1 cm. high, equally broad; corollas purple; phyllaries lanceolate, acute, subequal, grayish-tomentellous.

117. *Eupatorium perornatum* Klatt, Leopoldina 20: 90. 1884.

Eupatorium liebmanni Hemsl. Biol. Centr. Amer. Bot. 2: 96. 1881. (Without diagnosis or described synonym.)

Hebeclinium liebmanni Schultz Bip.; Hemsl. loc. cit., in synonymy.

Hebeclinium liebmannaiae Hook. f. & Jacks. Ind. Kew. 1: 1097. 1893, by error. Veracruz; type from Mirador.

Shrub with slender terete flexuous branches, finely tomentellous or incurved-puberulent; leaves opposite, ovate, slender-petioled, acuminate, sharply serrate, palmately 3 or 5-nerved from near the base, membranaceous, green and smoothish on both surfaces; heads 35 to 40-flowered, in compound leafy-bracted panicles; phyllaries lanceolate to lance-oblong, acute.

DOUBTFUL AND EXCLUDED SPECIES.

CONOCLINIUM (Eupatorium) ALBUM Mart. Linnaea 24: 194. 1851. Described from greenhouse material of Mexican origin and said to be a smooth half-shrub with somewhat deltoid acuminate serrate leaves, 3 to 5-headed corymbs, 24 to 30-flowered heads, and pappus of 13 bristles. The species is wholly obscure and in any event the name under *Eupatorium* is unavailable, owing to the earlier and still valid homonym.

EUPATORIUM KARVINSKIANUM DC. Prodr. 5: 163. 1836. De Candolle, describing this species from very fragmentary material, supposed it to be shrubby. Later specimens secured by Pringle and others seem to show it herbaceous throughout, and one collected by Galeotti is indicated on his label as an annual. It is therefore omitted from the foregoing treatment.

EUPATORIUM MICRANTHUM Lag. Gen. & Sp. Nov. 25. 1816. This wholly obscure plant, to judge from its blue florets, imbricate phyllaries, and the few other remarks regarding it, was presumably an *Ageratum*. There seems no satisfactory ground for applying the name, as did Lessing (Linnaea 5: 138), to a white or pink-flowered *Eupatorium* of Section *Eximbricata*. Lessing's *E. micranthum* must therefore receive the next later designation, namely *E. ligustrinum* DC. Prodr. 5: 181. 1836.

EUPATORIUM MICROCEPHALUM A. Gray, Proc. Amer. Acad. 21: 384. 1886. This is inseparable from *Ophryosporus ovatifolius* (DC.) Benth. & Hook. f.; Hemsl. Biol. Centr. Amer. Bot. 2: 79. 1881.

EUPATORIUM MICROPHYLLUM A. Gray; Dur. & Jacks. Ind. Kew. Suppl. 1: 166. 1902. A clerical error for the preceding and therefore referable to *Ophryosporus ovatifolius* (DC.) Benth. & Hook. f.

EUPATORIUM OLIGOLEPIS (Kunze) Hemsl. Biol. Centr. Amer. Bot. 2: 98. 1881. *Conoclinium oligolepis* Kunze, Del. Sem. Hort. Lips. 4: 2. 1840. Vaguely characterized and wholly obscure species, raised from Mexican seed in the Botanical Garden at Leipzig. Said to have been suffruticose, with erect sulcate pubescent stem, opposite, petiolate, deltoid-ovate, obsoletely sinuate-dentate, pubescent leaves, short-pedicel heads in contracted terminal corymb, and 15 to 20 subserial phyllaries.

EUPATORIUM PAPANTLENSE Less. Linnaea 6: 403. 1831. This species incompletely described by (briefly and for the most part negatively stated) comparative characters is still doubtful. It may have been only a form of the earlier *E. havanense* H. B. K., to which in any event it seems to have been closely related.

EUPATORIUM PETRAEUM Robinson, Proc. Amer. Acad. 41: 275. 1905. Transferred to *Ophryosporus* as *O. petraeus* Robinson, Contr. Gray Herb. n. ser. 75: 4. 1925.

EUPATORIUM POLYBOTRYUM DC. Prodr. 5: 174. 1836. From described character and tracing of type, this can not with certainty be separated from *Ophryosporus ovatifolius* (DC.) Benth. & Hook. f.; Hemsl. Biol. Centr. Amer. Bot. 2: 79. 1881.

EUPATORIUM POPOCATEPETLENSE, a binomial cited by Hemsley (Biol. Centr. Amer. Bot. 2: 99) and by him wrongly accredited to Schlechtendal, was an herbarium name used by Schultz-Bipontinus and applied by him to plants which fall into the much earlier *E. lucidum* Ortega, Hort. Matr. Dec. 35. 1797. Many specimens have been distributed as *E. popocatepetlense* by Pringle and others which belong to the plant here called *E. ligustrinum villiferum* Robinson.

EUPATORIUM SCABRELLUM Robinson, Proc. Amer. Acad. 35: 339. 1900. Now referred to the genus *Ophryosporus*, where it becomes *O. scabrellus* Robinson, Contr. Gray Herb. n. ser. 75: 4. 1925.

EUPATORIUM TULANUM Klatt, Abh. Naturf. Ges. Halle 15: 323. 1882. This is *Vernonia liatroides* DC. Prodr. 5: 34. 1836.

17. OPHRYOSPORUS Meyen, Reis. Erd. 1: 402. 1834.

(Contributed by Dr. B. L. Robinson.)

REFERENCES: Baker in Mart. Fl. Bras. 6²: 186. 1876; Robinson, Proc. Amer. Acad. 42: 17-27. 1906.

Shrubs or herbs with opposite or (in the Mexican species) chiefly alternate, petiolate leaves and numerous small, 4 to 12-flowered, homogamous heads borne in panicles or corymbs; corollas white; anthers without membranaceous apical appendage though with the connective sometimes slightly thickened and expanded between the summits of the anther cells; style branches filiform but perceptibly knobbed at tip.

A chiefly South American genus of about 25 species.

Phyllaries lance-oblong, mostly acutish, about 2-seriate, scarcely imbricate.

Heads about 3 mm. long, 5 to 8-flowered.....1. *O. ovatifolius*.

Heads 4.5 to 5 mm. long, about 10-flowered.....2. *O. scabrellus*.

Phyllaries (except the outermost) elliptic, very obtuse to rounded at tip, about 3-seriate, much imbricate.....3. *O. petraeus*.

1. *Ophryosporus ovatifolius* (DC.) Benth. & Hook. f.; Hems. Biol. Centr. Amer. Bot. 2: 79. 1881.

Nothites ovatifolia DC. Prodr. 5: 187. 1836.

?*Eupatorium polybotryum* DC. Prodr. 5: 174. 1836.

Eupatorium microcephalum A. Gray, Proc. Amer. Acad. 21: 384. 1886.

Eupatorium microphyllum A. Gray; Dur. & Jacks. Ind. Kew. Suppl. 1: 166.

1902. Clerical error for *E. microcephalum*.

Typical material of this species, early collected by Haenke in Mexico but without indication of locality, has never been precisely matched except by specimens collected by Seemann, also without recorded locality. A plant collected by Brandegee near Culiacán, Sinaloa, though not quite identical, is probably conspecific.

Suffruticose, softly grayish-puberulent and beset with sessile, yellowish to orange-brown, resinous globules; stem slender, terete, flexuous; leaves prevailingly alternate, short-petioled, ovate, crenate-serrate, acuminate, pinnately nerved from above the base, firmly membranaceous, 5 to 10 cm. long, 3 to 6 cm. wide; petiole 7 to 12 mm. long; heads 3 to 3.5 mm. long, 5 to 8-flowered, subracemose at tips of branches of a leafy-bracted panicle.

2. *Ophryosporus scabrellus* Robinson, Contr. Gray Herb. n. ser. 75: 4. 1925.

Eupatorium scabrellum Robinson, Proc. Amer. Acad. 35: 339. 1900.

Chihuahua; known only from the original collection, secured near Batopilas by Goldman.

Suffruticose, grayish-puberulent and somewhat glandular-atomiferous; leaves alternate, ovate, acuminate, crenate-serrate, the lower as much as 16 cm. long and 13 cm. wide, subcordate at base and with petiole 5 cm. in length; heads 4.5 to 5 mm. long, about 10-flowered; phyllaries little imbricate, lance-oblong, distinctly narrowed to an acutish tip.

3. *Ophryosporus petraeus* Robinson, Contr. Gray Herb. n. ser. 75: 4. 1925.

Eupatorium petraeum Robinson, Proc. Amer. Acad. 41: 275. 1905.

Michoacán and perhaps Guerrero.

Shrub 1.5 meters high; stem terete, single, erect, purple-spotted; leaves alternate, broadly ovate, acutish to acuminate, angled as well as irregularly crenate-dentate, almost palmately nerved from near the base, 9 to 11 cm. long, 8 to 9 cm. wide; panicle pyramidal; heads about 10-flowered; phyllaries (except the outermost) elliptic, very obtuse or rounded at apex, well imbricate in about 3 series.

18. **MIKANIA** Willd. Sp. Pl. 3: 1742. 1804.

REFERENCE: Robinson & Greenman, Synopsis of the Mexican and Central American species of the genus *Mikania*, Proc. Amer. Acad. 32: 10-13. 1896.

Shrubby or herbaceous, scandent; leaves opposite, usually ovate, petioled; heads panicled, 4-flowered; involucre of 4 equal phyllaries; achene 5-angled; pappus multisetose, uniseriate.

The names "guaco," "huaco," and "chichicaste" are reported as used in Mexico for plants of this genus whose specific identity is uncertain.

Heads racemously or spicately arranged on the branches of ample pyramidal panicles.

Heads pedicellate; pappus sordid.....1. *M. houstoniana*.

Heads sessile; pappus bright white.....2. *M. pterocaula*.

Heads in pyramidal, roundish, or flattish cymose panicles.

Stem and branches densely hirsute or setose-pilose with tawny hairs.

3. *M. eriophora*.

Stem and branches not setose-pilose.

Involucre more or less densely puberulous; heads 8 to 10 mm. high.

Leaves ovate, entire, strongly 5 or 7-nerved, subcoriaceous.

4. *M. tonduzii*.

Leaves usually hastate-lobed or toothed, mostly 3-nerved, thin.

Heads pedicellate; phyllaries obtuse.....5. *M. punctata*.

Heads usually sessile; phyllaries acute or acutish.....6. *M. cordifolia*.

Involucre nearly or quite glabrous; heads about 7 mm. high.

7. *M. gonzalezii*.

1. *Mikania houstoniana* (L.) Robinson, Proc. Amer. Acad. 42: 47. 1906.

Eupatorium houstonianum L. Sp. Pl. 836. 1753.

Eupatorium houstonis L. Syst. Nat. ed. 10. 2: 1204. 1759.

Eupatorium fruticosum Mill. Gard. Diet. ed. 8. *Eupatorium* no. 6. 1768.

Mikania houstonis Willd. Sp. Pl. 3: 1742. 1804.

Willoughbya houstonis Kuntze, Rev. Gen. Pl. 1: 372. 1891.

Veracruz to Panama and southward; type from Veracruz.

Shrubby twiner, essentially glabrous, or the inflorescence puberulous; leaf blades ovate, 5 to 13 cm. long, acuminate, rounded at base, entire, firm; heads very numerous, about 5 mm. high; involucre 3 mm. long. "Palo guaco" (*Urbina*).

2. *Mikania pterocaula* Schultz Bip. (Hemsl. Biol. Centr. Amer. Bot. 2: 103.

1881, nomen nudum); Klatt, Leopoldina 20: 91. 1884.

Known only from the type locality, Mirador, Veracruz.

Glabrous twiner; branchlets 6-winged; leaves ovate, acuminate, dentate, thin; heads very small.

3. *Mikania eriophora* Schultz Bip. (Hemsl. Biol. Centr. Amer. Bot. 2: 103.

1881, nomen nudum); Robins. & Greenm. Proc. Amer. Acad. 32: 12. 1896.

Willoughbya eriophora Kuntze, Rev. Gen. Pl. 1: 372. 1891, nomen nudum.

Known only from the type locality, Mirador, Veracruz.

Shrubby (?) twiner, densely tawny-hirsute-tomentose, the inflorescence woolly; leaf blades ovate, 7.5 to 10 cm. long, 5 cm. wide, acuminate, cordate, tomentose beneath; heads in large pyramidal panicles.

3a. *Mikania eriophora chiapensis* Robinson, Proc. Amer. Acad. 35: 341. 1900.

Chiapas.

Plant setose-pilose with straight hairs, not woolly; leaves large, the blades up to 22 by 17 cm.

4. *Mikania tonduzii* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 256. 1904.

Veracruz. Costa Rica; type from Tucurrique.

Suffrutescent twiner, sordidly glandular-puberulous, glabrate; leaf blades ovate, 5.5 to 14 cm. long, 4 to 9 cm. wide, acuminate, lucid and impressed-veined above; heads densely glomerate on the branches of the rather short inflorescence; involucre sordidly tomentulous; achene much shorter than corolla.

5. *Mikania punctata* Klatt, Bull. Soc. Bot. Belg. 31: 195. 1892.

Chiapas. Costa Rica; type from El General.

Suffrutescent (?) twiner, pilose with many-celled hairs, glabrate; leaf blades suborbicular to broadly deltoid-ovate, 4 to 9 cm. long and wide, subentire or hastate-lobed above base with spreading lobes, dotted with dark glands beneath; heads 9 to 10 mm. high, in ample pyramidal panicles.

6. *Mikania cordifolia* (L. f.) Willd. Sp. Pl. 3: 1746. 1804.

Cacalia cordifolia L. f. Suppl. Pl. 351. 1781.

Mikania suaveolens H. B. K. Nov. Gen. & Sp. 4: 135. 1820.

Mikania gonoclada DC. Prodr. 5: 199. 1836.

Tepec and San Luis Potosí to Guerrero and Veracruz. Louisiana; Guatemala to South America; type from "America meridionali" (i. e., Colombia).

Suffrutescent twiner, the 6-angled stems sordid-puberulous; leaf blades ovate, thin, deeply cordate, usually hastate or dentate, more or less densely pubescent; heads subsessile or pedicellate; involucre densely puberulous, 6 to 7 mm. high, with acute or acutish phyllaries. "Toxichec cimarrón" (San Luis Potosí, Seler).

7. *Mikania gonzalezii* Robins. & Greenm. Proc. Bost. Soc. Nat. Hist. 29: 107. 1899.

Veracruz; type from Colonia Melchor Ocampo.

Suffrutescent (?), smoothish; leaf blades ovate, thin, glabrous, 4 to 12 cm. long, 3 to 10 cm. wide; heads open-paniculate; phyllaries obtusish or barely acute, essentially glabrous except at tip.

19. **CARPHOCHAETE** A. Gray, Mem. Amer. Acad. n. ser. 4: 65. 1849.

Suffrutescent, with narrow sessile opposite entire punctate leaves; heads paniced or rarely solitary, pedunculate or rarely sessile, narrowly cylindrical, 2 to 3 cm. long, few-flowered; involucre of few narrow unequal subherbaceous phyllaries; achenes linear, 8 to 10-ribbed; pappus of 4 to 14 linear-attenuate, narrowly scarious-margined awns.

The genus contains only the four following species.

Leaves narrowly linear, 1 to 3 mm. wide, attenuate; pappus awns 4 or 5; phyllaries all attenuate.....1. **C. wislizeni**.

Leaves linear-elliptic or narrowly elliptic to linear, obtuse; pappus awns 7 to 14; phyllaries obtuse and mucronate to acute, or the inner acuminate.

Phyllaries mucronate from an obtuse or rounded apex, densely arachnoid-ciliate at tip.....2. **C. grahami**.

Phyllaries acute to acuminate, not densely arachnoid-ciliate at tip.

Phyllaries glandular-punctate but not stipitate-glandular; leaves linear-elliptic to elliptic-spatulate.....3. **C. bigelovii**.

Phyllaries densely stipitate-glandular; leaves linear.....4. **C. schaffneri**.

1. *Carphochaete wislizeni* A. Gray, Mem. Amer. Acad. n. ser. 4: 65. 1849.
Chihuahua to Durango; type from Cosihuiriachi, Chihuahua.
Suffrutescent, much branched at base, 20 to 35 cm. high, resiniferous-glandular; leaves linear, 3 to 6 cm. long, 1 to 3 mm. wide; heads flattish-panicled or rarely solitary, 2 to 2.5 cm. high, purple; achenes about 7 mm. long, exceeded by the pappus.
2. *Carphochaete grahami* A. Gray, Pl. Wright. 1: 89. 1852.
Jalisco to Mexico; type from Mexico, without definite locality.
Suffrutescent, many-stemmed, branched above, about 40 cm. high; leaves elliptic to elliptic-spatulate, about 2.5 cm. long, 3 to 5 mm. wide, the upper alternate and smaller; panicle open; involucre strongly graduated, the outer phyllaries obtuse or rounded, mucronate, the inner acute.
3. *Carphochaete bigelovii* A. Gray, Pl. Wright. 1: 89. 1852.
Chihuahua. New Mexico and Arizona; type from the boundary between New Mexico and Mexico.
Suffrutescent, branching, 30 to 50 cm. high; leaves linear-elliptic to spatulate-elliptic, 1.5 to 3 cm. long, 2 to 5 mm. wide, with fascicles of smaller ones in the axils; heads chiefly sessile, 2.5 to 3 cm. high, the flowers purplish-tinged; phyllaries narrowly oblong-lanceolate, acute to acuminate, densely glandular-punctate and sparsely puberulous.
4. *Carphochaete schaffneri* Greenm. Proc. Amer. Acad. 40: 34. 1904.
San Luis Potosí; type from Valley of San Luis Potosí.
Suffrutescent, slender, branched, 20 to 35 cm. high; leaves linear, 2 to 5 cm. long, 2 to 3 mm. wide; heads pedunculate, the flowers purplish; phyllaries as in the last, but densely stipitate-glandular.

20. **COLEOSANTHUS** Cass. Bull. Soc. Philom. Paris 1817: 67. 1817.

REFERENCE; Robinson, A monograph of the genus *Brickellia*, Mem. Gray Herb. 1: 1-151. 1917.

Herbs or shrubs; leaves opposite or alternate; heads usually panicled, small to large, white to purple, rarely ochroleucous; involucre cylindric or campanulate, the phyllaries usually multiseriate, dry, striate, the outermost rarely herbaceous; achenes prismatic, 10-ribbed (very rarely 5 to 8 or 20-ribbed); pappus of numerous smooth or barbellate, rarely subplumose setae.

The name "hierba del carbonero" is reported for some undetermined species of the genus.

Pedicels gemmiparous; heads 4 to 20-flowered.

Leaves linear or narrowly lanceolate; heads 4 to 12-flowered.

Leaves entire; heads 6 to 12-flowered.....1. *C. squamulosus*.

Leaves spinulose-serrate; heads 4 or 5-flowered.....2. *C. spinulosus*.

Leaves ovate; heads about 20-flowered.....3. *C. vernicosus*.

Pedicels not gemmiparous; heads 8 to 100-flowered.

Heads large, 28 to 62-flowered.

Pedicels stipitate-glandular.

Leaves sessile or subsessile; outer phyllaries sometimes dentate.

42. *C. argutus*.

Leaves petiolate; phyllaries not dentate.

Petioles 3 to 4 mm. long.

Phyllaries all acute or acutish.....43. *C. brandegei*.

Middle and inner phyllaries very obtuse.....44. *C. macromérus*.

Petioles usually 1 to 2.5 cm. long.

Leaves griseous-tomentose beneath, crenate ...45. *C. peninsularis*.

Leaves merely puberulous and green beneath, entire or repand.

46. *C. rhomboideus*

- Pedicels without stipitate glands.....47. *C. lanatus*.
 Heads small or medium, 8 to 26-flowered (rarely to 62-flowered in forms of
C. veronicaefolius).
- Leaves sessile or very short-petioled.
- Leaves spatulate, 3 to 12 mm. long.....4. *C. frutescens*.
 Leaves not spatulate, usually larger.
- Leaves 1 to 2 cm. long, suborbicular-ovate; outer phyllaries more or
 less squarrose-tipped.....5. *C. microphyllus*.
 Leaves larger, not suborbicular.
- Leaves lanceolate to oblong or elliptic, not cuspidate, not cordate
 at base.
- Heads about 10-flowered.
- Phyllaries numerous (about 40); achenes about 5 mm. long.
6. *C. cylindraceus*.
 Phyllaries few (about 15); achenes about 3 mm. long.
7. *C. lemmoni*.
- Heads 14 to 24-flowered.
- Heads (at least in part) slender-pedicelcd.
- Leaves crenate or crenate-serrate.
- Outer phyllaries suborbicular, rounded or retuse and
 abruptly mucronate.....8. *C. venosus*.
 Outer phyllaries ovate or ovate-oblong, usually acute or
 acuminate.....9. *C. oliganthes*.
- Leaves entire.....10. *C. reticulatus*.
- Heads sessile or subsessile.
- Phyllaries thin, colored; with very acuminate tips.
11. *C. verbenaceus*.
 Phyllaries thick, usually stramineous, with obtuse tips.
12. *C. pringlei*.
- Leaves ovate or oval-ovate, cordate at base, strongly cuspidate.
13. *C. cuspidatus*.
- Leaves distinctly petioled, the petiole at least one-fifth as long as the
 blade.
- Leaves more or less hastately toothed or lobed.
- Leaves lance-oblong or lanceolate, rounded at apex...14. *C. hastatus*.
 Leaves deltoid-ovate, acuminate, or rarely obtuse but then not lance-
 oblong.
- Outer phyllaries ovate-lanceolate, acute or acuminate.
- Leaves 1.5 to 2.5 (rarely 6.5) cm. long, thickish; petioles 8 to 15 mm.
 long.....15. *C. coulteri*.
 Leaves 4.5 to 7 cm. long, thin; petioles 1.2 to 4 cm. long.
16. *C. megalodontus*.
- Outer phyllaries ovate-oblong or suborbicular, obtuse or rounded.
- Phyllaries scarious-margined, mucronulate.
- Grayish-pubescent; leaves membranaceous, acutely acuminate.
17. *C. brachiatus*.
 Glabrous; leaves thick, often obtuse.....18. *C. glabratus*.
 Phyllaries scarcely scarious-margined, not mucronulate.
19. *C. cymuliferus*.
- Leaves not at all hastate.
- Leaves broadly ovate to suborbicular or reniform, mostly 0.5 to 2
 (rarely 6) cm. long; heads smaller, often glomerate.
- Involucre 5 to 9 mm. high.
- Outer phyllaries shortly caudate; leaves very small, flabellate-
 rhomboid.....20. *C. glutinosus*.

Outer phyllaries not caudate; leaves otherwise.

Leaves mostly rhombic-ovate, coarsely toothed.

21. *C. laciniatus*.

Leaves ovate to suborbicular, crenate-serrate.

Heads 8 to 18-flowered, 3 to 5 mm. thick; leaves ovate, on petioles usually about 1 cm. long. 22. *C. californicus*.

Heads 18 to 62-flowered, 6 to 11 mm. thick; leaves suborbicular or reniform, short-petioled. 23. *C. veronicaefolius*.

Involucre 12 to 14 mm. high. 24. *C. palmeri*.

Leaves narrower, ovate to oblong or elliptic, 2 to 15 cm. long.

Phyllaries slightly graduate, the outermost subherbaceous or foliaceous, from half as long as the inner to longer.

Leaves softly tomentose beneath. 40. *C. pacayensis*.

Leaves puberulous to nearly glabrous beneath.

41. *C. floribundus*.

Phyllaries strongly graduate, the outermost very short.

Achenes 3 to 3.7 mm. long.

Leaves elliptic-ovate to rhombic-ovate.

Heads sessile, glomerate. 25. *C. glomeratus*.

Heads mostly pedicellate.

Inflorescence dichotomous; phyllaries obtuse.

26. *C. hebecarpus*.

Inflorescence paniculate, elongate; phyllaries acute.

27. *C. nelsonii*.

Leaves suborbicular-ovate to deltoid-ovate.

Leaves suborbicular-ovate; outer phyllaries with subsquarrose tips. 28. *C. paniculatus*.

Leaves deltoid-ovate; outer phyllaries not subsquarrose-tipped.

Inner phyllaries acute. 29. *C. secundiflorus*.

Inner phyllaries obtuse. 30. *C. parryi*.

Achenes 4 to 5.5 mm. long.

Middle and usually also the inner phyllaries obtuse, sometimes mucronate.

Leaves coriaceous or thickish.

Leaves deltoid-ovate.

Outermost phyllaries ovate-lanceolate, acutish.

30. *C. parryi*.

Outermost phyllaries broadly oval, rounded.

31. *C. tomentellus*.

Leaves lanceolate. 32. *C. lancifolius*.

Leaves thin, membranaceous. 33. *C. orizabaensis*.

Middle and inner phyllaries acute or acuminate.

Leaves oblong-ovate to ovate-lanceolate. Pedicels densely glandular. 34. *C. pendulus*.

Leaves ovate to suborbicular-ovate.

Leaves ovate, chartaceous.

Heads secund-racemose. 35. *C. seemannii*.

Heads thyrsoid. 36. *C. saltillensis*.

Leaves deltoid-ovate to suborbicular-ovate, never chartaceous.

Inflorescence loose, the cymes strongly nodding.

37. *C. squarrosus*.

Inflorescence rather dense, the cymes erect or slightly nodding.

Leaves membranaceous. 38. *C. botterii*.

Leaves subcoriaceous or firm. 39. *C. adenocarpus*.

1. **Coleosanthus squamulosus** (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia squamulosa A. Gray, Proc. Amer. Acad. 15: 30. 1879.
 Chihuahua to Guanajuato; type from City of San Luis Potosí. New Mexico and Arizona.
 Shrub 50 cm. high; stem leaves sessile, parallel-veined, 3 to 7 cm. long, 1 to 1.5 mm. wide, mostly absent in flowering specimens; panicle dense, narrow, elongate; many of the pedicels bearing small cypress-like bulblets; heads about 12 mm. high.
2. **Coleosanthus spinulosus** (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Clavigera spinulosa A. Gray, Mem. Amer. Acad. n. ser. 4: 63. 1849.
Brickellia spinulosa A. Gray, Pl. Wright. 1: 84. 1852.
 Chihuahua to Zacatecas and San Luis Potosí; type collected near Chihuahua City.
 Similar to *C. squamulosus*; leaves linear to linear-lanceolate, spinulose-serrate, petiolate, glabrous, 1 to 1.7 cm. long, 1 to 3 mm. wide.
- 2a. **Coleosanthus spinulosus asperatus** (Robinson) Blake.
Brickellia squamulosa asperata Robinson, Mem. Gray Herb. 1: 35. 1917.
 Known only from vicinity of City of Chihuahua.
 Leaves papillose-asperate.
3. **Coleosanthus vernicosus** (Robinson) Blake.
Brickellia vernicosa Robinson, Proc. Amer. Acad. 36: 487. 1901.
 Durango; type from Santiago Papasquiaro.
 Shrub 50 cm. high, resinous-puberulous; leaves short-petioled, the blades ovate or oval-ovate to (on the branches) narrowly lanceolate, 1 to 1.7 cm. long, 4 to 12 mm. wide, serrate, short-petioled; heads racemed on the branches, 13 to 16 mm. high. (Description compiled.) "Barba de chivo."
4. **Coleosanthus frutescens** (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia frutescens A. Gray, Proc. Amer. Acad. 17: 207. 1882.
 Baja California; type from Tantillas Canyon. Nevada and California.
 Low much-branched shrub, griseous-tomentellous; leaves alternate, the blades spatulate, 3 to 12 mm. long, 1.5 to 4 mm. wide, 1-nerved, entire or sparsely denticulate; heads pedunculate, loosely paniced, 14 mm. high, about 26-flowered.
5. **Coleosanthus microphyllus** (Nutt.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Bulbostylis microphylla Nutt. Trans. Amer. Phil. Soc. II. 7: 286. 1840.
Brickellia microphylla A. Gray, Pl. Wright. 1: 85. 1852.
Brickellia cedrosensis Greene, Bull. Torrey Club 10: 86. 1883.
Coleosanthus cedrosensis Greene, Erythea 1: 54. 1893.
Brickellia grayana Hieron. Bot. Jahrb. Engler 28: 583. 1901.
 Cedros Island, Baja California. Oregon to California; type from Blue Mountains, Oregon.
 Shrubby, viscid-pubescent, about 50 cm. high; leaves alternate, the blades thick, toothed, those of the branchlets reduced; heads mostly terminating short branchlets, 10 to 12 mm. high, about 22-flowered; at least the outer phyllaries with short herbaceous spreading tips.
6. **Coleosanthus cylindraceus** (Gray & Engelm.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia cylindracea Gray & Engelm. Proc. Amer. Acad. 1: 46. 1847.
 Coahuila. Texas; type from Guadalupe River, near New Braunfels.
 Shrubby at base, 0.2 to 1.2 meters high, griseous-puberulous; leaves chiefly opposite, the blades 2 to 6 cm. long, 1.2 to 3 cm. wide, crenate-serrate; heads racemose or thyrsoid-paniced, slender-pedicel, about 12 mm. high, about 10-flowered.

7. *Coleosanthus lemmoni* (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia lemmoni A. Gray, Proc. Amer. Acad. 17: 206. 1882.
 Chihuahua. Southern Arizona; type from Chiricahua Mountains.
 Suffrutescent below, about 50 cm. high, griseous-puberulous; leaf blades elliptic to lance-oblong, 2 to 4.5 cm. long, 1 to 1.4 cm. wide, crenate-serrate, griseous-puberulous; heads racemose or spicate, at length conical-paniculate, slender-pediceled, 11 to 14 mm. high, about 10-flowered.
- 7a. *Coleosanthus lemmoni wootoni* (Greene) Blake.
Coleosanthus wootoni Greene, Bull. Torrey Club 24: 511. 1897.
Coleosanthus densus Greene, Pittonia 4: 126. 1900.
Brickellia lemmoni wootoni Robinson, Mem. Gray Herb. 1: 50. 1917.
 Chihuahua. New Mexico; type from Organ Mountains.
 Heads mostly subsessile, thyrsoïd-panicled.
8. *Coleosanthus venosus* Woot. & Standl. Contr. U. S. Nat. Herb. 16: 177. 1913.
Brickellia venosa Robinson, Mem. Gray Herb. 1: 50. 1917.
 Sonora and Chihuahua. New Mexico and Arizona; type from Mangas Springs, New Mexico.
 Frutescent at base, griseous-puberulous, about 70 cm. high; leaf blades narrowly elliptic or linear-elliptic, 2.5 to 5.5 cm. long, 2 to 9 mm. wide, crenate or subentire, obtuse; heads 1 cm. high, about 24-flowered, on slender pedicels mostly twice as long, forming a narrow loose panicle.
9. *Coleosanthus oliganthes* (Less.) Kuntze, Rev. Gen. Pl. 1: 328. 1891, as *C. oliganthus*.
Eupatorium oliganthes Less. Linnaea 5: 137. 1830.
Bulbostylis oliganthes DC. Prodr. 5: 139. 1836.
Brickellia oliganthes A. Gray, Pl. Wright. 1: 84. 1852.
Coleosanthus polyanthemus Greene, Pittonia 4: 126. 1900.
 Nuevo León to Veracruz; type from Hacienda de La Laguna, Veracruz.
 Herbaceous or suffrutescent, about 60 cm. high, griseous-puberulous; leaf blades oblong to oval, 2.5 to 5.5 cm. long, 1 to 2 cm. wide, crenate-serrulate, coriaceous; heads about 12 mm. high, slender-pediceled or subsessile, in a narrow, often spiciform panicle.
10. *Coleosanthus reticulatus* (DC.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Bulbostylis reticulata DC. Prodr. 7: 268. 1838.
Brickellia reticulata A. Gray, Pl. Wright 1: 84. 1852.
 Mexico; exact locality not known.
 Suffrutescent, griseous-puberulous; leaves oblong, entire, coriaceous; heads pedicellate, about 20-flowered. (Description compiled.)
11. *Coleosanthus verbenaceus* Greene, Pittonia 4: 125. 1900.
Brickellia verbenacea Robinson, Mem. Gray Herb. 1: 53. 1917.
 San Luis Potosí to Morelos and Jalisco; type from San Luis Potosí.
 Suffrutescent or herbaceous, up to 1.2 meters high, scabriusculous; leaf blades oblong-elliptic to ovate-oblong, 3 to 6 cm. long, 1 to 2.8 cm. wide, serrate, very strongly reticulate beneath, coriaceous; heads chiefly sessile in a spikelike panicle, about 14-flowered; phyllaries firm but thin.
12. *Coleosanthus pringlei* (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia pringlei A. Gray, Proc. Amer. Acad. 17: 206. 1882.
 Sonora and Tepic. Southern Arizona; type from Santa Catalina Mountains.
 Suffrutescent or herbaceous, scabrous-puberulous; leaf blades oblong or lance-oblong, 2 to 6 cm. long, 1 to 2 cm. wide, serrate, coriaceous, griseous-tomentellous or scabriusculous beneath; heads sessile or nearly so in the upper axils, sometimes glomerate, 16 to 18 mm. high, 19 to 24-flowered.

13. *Coleosanthus cuspidatus* (A. Gray) Greene, *Erythraea* 1: 54. 1893.
Brickellia cuspidata A. Gray in S. Wats. Proc. Amer. Acad. 22: 421. 1887.
Jalisco; type from Río Blanco.
Fruticose or suffrutescent, 40 to 70 cm. high, puberulous; leaf blades broadly ovate, 1 to 3 cm. long, 7 to 20 mm. wide, serrate, coriaceous, nearly glabrous; heads loosely paniced, 12 mm. high, about 11-flowered.
14. *Coleosanthus hastatus* (Benth.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia hastata Benth. Bot. Voy. Sulph. 21. 1844.
Baja California; type from Magdalena Bay.
Fruticose, minutely puberulous; leaf blades 3.5 to 10 cm. long, 1 to 6 cm. wide, hastate-lobed at base, obtuse, thinnish, obscurely puberulous beneath; heads in small terminal panicles, about 11 mm. high, 12 or 13-flowered; phyllaries obtuse or obtusish.
15. *Coleosanthus coulteri* (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia coulteri A. Gray, Pl. Wright. 1: 86. 1852.
Sonora to Puebla, Colima, and Baja California. Arizona; type from Arizona (probably).
Frutescent, up to 90 cm. high, the younger parts puberulous and often glandular; leaf blades triangular or rhombic-ovate, 1.5 to 2.5 (rarely 6.5) cm. long, 1 to 2 (rarely 5) cm. wide, thickish, more or less puberulous; heads slender-pedicled, loosely paniced, 9 to 12 mm. high, about 17-flowered; phyllaries mostly acute to acuminate.
16. *Coleosanthus megalodontus* (Greenm.) Arthur, *Torreya* 21: 12. 1921.
Brickellia megalodonta Greenm. Proc. Amer. Acad. 40: 34. 1904.
Jalisco and Puebla; type from Guadalajara, Jalisco.
Herbaceous or (?) suffrutescent, pilosulous or pubescent; leaf blades triangular-ovate, 4.5 to 7 cm. long, 3 to 5 cm. wide, thin, coarsely hastate-toothed; heads as in *C. coulteri*.
17. *Coleosanthus brachiatus* (A. Gray) Blake.
Brickellia brachiata A. Gray, Proc. Amer. Acad. 21: 385. 1886.
Chihuahua; type from southwestern Chihuahua.
Herbaceous or suffrutescent, griseous-puberulous; leaf blades triangular-ovate, 3 to 4.5 cm. long; petioles 1 to 1.3 cm. long; heads loosely paniced, 12 to 15 mm. high, about 16-flowered.
- 17a. *Coleosanthus brachiatus adenopodus* (Robinson) Blake.
Brickellia brachiata adenopoda Robinson, Mem. Gray Herb. 1: 63. 1917.
Sinaloa; type from San Blas.
Plant puberulous with gland-tipped hairs.
18. *Coleosanthus glabratus* (Rose) Blake.
Brickellia brachiata glabrata Rose, Contr. U. S. Nat. Herb. 1: 132. 1892.
Brickellia glabrata Robinson, Mem. Gray Herb. 1: 63. 1917.
Baja California; type from Carmen Island.
Shrubby, glabrous; leaf blades triangular-ovate, 0.8 to 2.5 cm. long, 0.3 to 2.2 cm. wide, acutish to obtuse; petioles 3 to 7 mm. long.
19. *Coleosanthus cymuliferus* (Robinson) Blake.
Brickellia cymulifera Robinson, Proc. Amer. Acad. 51: 538. 1916.
Known only from the type locality, Minas de San Rafael, San Luis Potosí.
Subherbaceous, 30 to 40 cm. high, crisply puberulous; leaf blades hastate-deltoid, 3 to 5.4 cm. long, 2.5 to 3.8 cm. wide, caudate-acuminate, coarsely toothed, puberulous; petioles 1 to 4 cm. long; heads in slender, loosely 3 to 5-headed, axillary cymes, about 12-flowered. (Description compiled.)

20. *Coleosanthus glutinosus* (A. Gray) Blake.

Brickellia glutinosa A. Gray, Proc. Amer. Acad. **21**: 385. 1886.

Known only from the type locality, near Jimuleo, Coahuila.

Fruticose, glutinous-scabridulous, about 25 cm. high; leaf blades 5 to 8 mm. long and wide, dentate-lobate, punctate, coriaceous; heads about 26-flowered, terminating branchlets; phyllaries thick, stramineous, acute, the outer with short caudate tips.

21. *Coleosanthus laciniatus* (A. Gray) Kuntze, Rev. Gen. Pl. **1: 328. 1891.**

Brickellia laciniata A. Gray, Pl. Wright. **1**: 87. 1852.

Chihuahua to Nuevo León and Zacatecas. Texas and New Mexico; type collected 40 miles east of El Paso, Texas.

White-barked, hispidulous-puberulous, up to 1.2 meters high; leaves alternate, the blades broadly ovate to rhombic-ovate, 6 to 15 mm. long and wide, coarsely and bluntly toothed, coriaceous; heads 9 to 12 mm. high, about 9-flowered, in long narrow leafy inflorescences; phyllaries thinnish, obtuse, scarious-margined.

22. *Coleosanthus californicus* (Torr. & Gray) Kuntze, Rev. Gen. Pl. **1: 328. 1891.**

Bulbostylis californica Torr. & Gray, Fl. N. Amer. **2**: 79. 1841.

Brickellia californica A. Gray, Mem. Amer. Acad. n. ser. **4**: 64. 1849.

Brickellia wrightii A. Gray, Pl. Wright. **2**: 72. 1853.

Coleosanthus melissaeifolius Greene, Leaflets **1**: 150. 1905.

Chihuahua, Sonora, and northern Baja California. Colorado to California and Texas; type from California.

Fruticose, up to 1 meter high, griseous-puberulous; leaves alternate, the blades deltoid-ovate, 1 to 5 cm. long and broad, subtruncate or cordate at base, thickish; petioles 4 to 20 mm. long; heads racemosely or spicately arranged.

22a. *Coleosanthus californicus tener* (A. Gray) Blake.

Brickellia tenera A. Gray, Pl. Wright. **2**: 72. 1853.

Brickellia wrightii tenera A. Gray, Syn. Fl. **1**²: 106. 1884.

Coleosanthus tener Kuntze, Rev. Gen. Pl. **1**: 328. 1891.

Coleosanthus axillaris Greene, Leaflets **1**: 149. 1905.

Brickellia californica tenera Robinson, Mem. Gray Herb. **1**: 70. 1917.

Sonora; type from Santa Cruz. Utah to Arizona and New Mexico.

Similar; leaves mostly 3.5 to 4.5 cm. long, ovate, thin, abruptly narrowed or rounded at base; heads usually glomerate in the axils.

22b. *Coleosanthus californicus lobulatus* (Robinson) Blake.

Brickellia californica lobulata Robinson, Mem. Gray Herb. **1**: 71. f. 48, δ . 1917.

Known only from the type locality, near Parras, Coahuila.

Leaves thin, about 4 cm. long and wide, deltoid-ovate, broadly cordate, coarsely crenate-lobulate.

23. *Coleosanthus veronicaefolius* (H. B. K.) Kuntze, Rev. Gen. Pl. **1: 328. 1891, as *C. veronicifolius*.**

Eupatorium veronicaefolium H. B. K. Nov. Gen. & Sp. **4**: 112. pl. 341. 1820.

Bulbostylis veronicaefolia DC. Prodr. **5**: 139. 1836.

Brickellia galeottii A. Gray, Pl. Wright. **1**: 85. 1852.

Coleosanthus galeottii Kuntze, Rev. Gen. Pl. **1**: 328. 1891.

Coahuila to Oaxaca; type from State of Mexico, near Guadalupe.

Shrubby, about 80 cm. high, griseous-puberulous or hispidulous; leaves opposite, the blades 4 to 16 mm. long, 7 to 25 mm. wide, crenate, thick, griseous-puberulous; petioles 3 to 6 mm. long; heads 12 to 17 mm. high, 18 to 25-flowered, paniced or subspicate; outer phyllaries tomentose at tip, obtuse. "Gobernadora," "gobernadora de Puebla" (Hidalgo); "mejorana" (Zacatecas); "peistón," (*Urbina*); "pexto," "pextón" (*Ramírez*); "pestón," "orégano del cerro" (Durango); "orégano del monte," "orégano del campo."

A decoction of the plant is employed locally as a remedy for dyspepsia and other affections of the stomach, as a stimulant, and also in the form of fomentations as a remedy for rheumatism.

23a. *Coleosanthus veronicaefolius senilis* (Robinson) Blake.

Brickellia veronicaefolia senilis Robinson, Mem. Gray Herb. 1: 72. 1917.

Puebla; type from hills above Chalchicomula.

Leaves densely griseous-tomentulose.

23b. *Coleosanthus veronicaefolius petrophilus* (Robinson) Blake.

Brickellia petrophila Robinson, Proc. Amer. Acad. 36: 486. 1901.

Brickellia veronicaefolia petrophila Robinson, Mem. Gray Herb. 1: 72. 1917.

Sonora to Puebla and Guanajuato; type from City of Chihuahua.

Similar to *C. veronicaefolius*; pubescence of longer looser septate hairs, mixed with glands; heads 25 to 35-flowered.

23c. *Coleosanthus veronicaefolius umbratilis* (Robinson) Blake.

Brickellia petrophila umbratilis Robinson, Proc. Amer. Acad. 36: 487. 1901.

Brickellia veronicaefolia umbratilis Robinson, Mem. Gray Herb. 1: 73. 1917.

Coahuila and Durango; type from Parras, Coahuila.

Similar to the last; heads larger, usually 40 to 60-flowered; inflorescence loose, the heads pedicellate.

24. *Coleosanthus palmeri* (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.

Brickellia palmeri A. Gray, Proc. Amer. Acad. 15: 30. 1879.

San Luis Potosí.

Suffruticose, 50 cm. high, densely glandular-puberulous, scabridulous; leaves alternate, the blades ovate, 1.8 to 3.3 cm. long, 1.2 to 3 cm. wide, coriaceous, serrate, reticulate; petioles 3 to 6 mm. long; heads about 19-flowered, slender-pedicel, loosely racemose-paniculate; phyllaries acuminate, stipitate-glandular.

24a. *Coleosanthus palmeri amphothrix* (Robinson) Blake.

Brickellia palmeri amphothrix Robinson, Mem. Gray Herb. 1: 74. f. 51, β . 1917.

Coahuila or Nuevo León to Zacatecas and Aguascalientes; type from Zacatecas.

Leaves often triangular-ovate, larger; stem and under leaf surface tomentulose or hispidulous as well as glandular.

25. *Coleosanthus glomeratus* (Fernald) Blake.

Brickellia glomerata Fernald, Proc. Amer. Acad. 36: 504. 1901.

Guerrero and Morelos to Oaxaca; type from Acapulco, Guerrero.

Frutescent, 1 meter high, scabrous-hispidulous; leaf blades oblong-ovate to ovate, 2 to 6.5 cm. long, 1.5 to 4 cm. wide, thick, finely reticulate-venose, crenate-serrate, griseous-puberulous and glandular; heads 12 mm. high, about 11-flowered; phyllaries arachnoid-ciliate, strongly graduated.

26. *Coleosanthus hebecarpus* (DC.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.

Bulbostylis hebecarpa DC. Prodr. 5: 138. 1836.

Brickellia hebecarpa A. Gray, Pl. Wright. 1: 85. 1852.

Brickellia colimae Rose, Contr. U. S. Nat. Herb. 1: 333. 1895.

Tepic to Jalisco and Morelos.

Suffruticose, puberulous; leaf blades ovate, 2 to 3 cm. long, 1 to 2 cm. wide, coriaceous, crenate-serrate, reticulate, griseous-tomentulous; heads pedicellate, loosely and dichotomously arranged, the pedicels glandular-puberulous.

27. *Coleosanthus nelsonii* (Robinson) Blake.

Brickellia nelsonii Robinson, Mem. Gray Herb. 1: 79. f. 56. 1917.

Nuevo León and Tamaulipas; type from Jaumave, Tamaulipas.

Herbaceous or suffruticose below, about 1 meter high, loosely griseous-pubescent; leaf blades ovate or rhombic-ovate, 3 to 6 cm. long, 1.5 to 4 cm. wide, crenate, rather thin, griseous-pilosulous and gland-dotted; heads mostly pedicellate, in a leafy panicle, about 11-flowered.

- 28. *Coleosanthus paniculatus*** (Mill.) Standl. in Standl. & Calderón, *Lista Pl. Salv.* 219. 1925.
Eupatorium paniculatum Mill. Gard. Dict. ed. 8. *Eupatorium* no. 15. 1768.
Eupatorium rigidum Benth. Pl. Hartw. 88. 1841. Not *E. rigidum* Swartz, 1788.
Brickellia hartwegi A. Gray, Pl. Wright. 1: 85. 1852.
Coleosanthus rigidus Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia paniculata Robinson, Proc. Amer. Acad. 42: 48. 1906.
 Tepic and Jalisco to Veracruz, south to Costa Rica; type from Veracruz.
 Frutescent, 2 meters high, griseous-tomentulose; leaf blades 2.8 to 7.5 cm. long and broad, thick, crenate-serrate, densely canescent-tomentulose beneath; heads 10 to 12 mm. high, pedicellate, in a broad panicle, about 18-flowered; pedicels stipitate-glandular.
- 29. *Coleosanthus secundiflorus*** (Lag.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Eupatorium secundiflorum Lag. Gen. & Sp. Nov. 25. 1816.
Bulbostylis secundiflora DC. Prodr. 5: 138. 1836.
Bulbostylis scorodoniaefolia Kunth, "Ind. Sem. Hort. Berol. 1846: 12. 1847;"
 Ann. Sci. Nat. III. Bot. 7: 187. 1847.
Brickellia secundiflora A. Gray, Pl. Wright. 1: 85. 1852.
 Tamaulipas to Oaxaca.
 Fruticose, densely stipitate-glandular, griseous-tomentellous; leaf blades 3 to 7 cm. long, 2 to 5 cm. wide, acute, reticulate, griseous-tomentellous beneath; heads 11 to 16 mm. high, about 20-flowered, in a leafy thyrsoïd panicle; phyllaries all acute or acuminate, usually stipitate-glandular.
- 29a. *Coleosanthus secundiflorus nepetaefolius*** (H. B. K.) Blake.
Eupatorium nepetaefolium H. B. K. Nov. Gen. & Sp. 4: 112. 1820.
Bulbostylis ? nepetaefolia DC. Prodr. 5: 139. 1836.
Brickellia secundiflora nepetaefolia Robinson, Mem. Gray Herb. 1: 82. 1917.
 Jalisco to Zacatecas and Guanajuato; type from Santa Rosa Mountains, Guanajuato.
 Similar, but the pubescence denser, the glands lacking or obscure.
- 30. *Coleosanthus parryi*** (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia parryi A. Gray, Proc. Amer. Acad. 15: 31. 1879.
 San Luis Potosí and Zacatecas; type from east of City of San Luis Potosí.
 Suffrutescent or fruticose, similar to *C. secundiflorus nepetaefolius*; heads smaller, 10 to 14 mm. high, 20 to 25-flowered; phyllaries obtuse.
- 30a. *Coleosanthus parryi micaceus*** (Robinson) Blake.
Brickellia parryi micacea Robinson, Mem. Gray Herb. 1: 83. 1917.
 Known only from the type locality, near Álvarez, San Luis Potosí.
 Leaves beneath merely puberulous on the veins, densely dotted with shining glands.
- 31. *Coleosanthus tomentellus*** (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.
Brickellia tomentella A. Gray, Pl. Wright. 1: 85. 1852.
 Puebla and State of Mexico to Oaxaca; type from Mexico, without definite locality.
 Suffrutescent (?), 1.5 to 2.5 meters high, softly gray-tomentellous or tomentose; leaf blades 4 to 7 cm. long, 3 to 5 cm. wide, crenate, grayish green above, densely griseous-tomentose beneath; heads 21 to 32-flowered; outer phyllaries tomentose.
- 32. *Coleosanthus lancifolius*** (Robins. & Greenm.) Blake.
Brickellia lancifolia Robins. & Greenm. Amer. Journ. Sci. III. 50: 153. 1895.
 Known only from the type locality, Sierra de San Felipe, Oaxaca.
 Fruticose, 1.5 to 2.5 meters high, sordid-tomentellous; leaf blades 4.5 to 7 cm. long, 1.4 to 2.5 cm. wide, acuminate, subentire, tomentulose beneath; heads thyrsoïd-panicled, mostly nodding, 17 to 20 mm. high, 10 to 12-flowered; phyllaries purplish, glabrous except for the tips of the outermost.

33. *Coleosanthus orizabaensis* (Klatt) Blake.

Brickellia orizabaensis Klatt, Ann. Naturh. Hofmus. Wien 9: 358. 1894.

Veracruz, Guerrero, and Oaxaca; type from Orizaba, Veracruz.

Herbaceous, or lignescent at base, 1.5 to 2.5 meters high, sordid-puberulous; leaf blades ovate, 4 to 7 cm. long, 2.5 to 5.3 cm. wide, crenate-serrate, puberulous chiefly on the veins beneath; heads paniced, nodding, 13 mm. high, about 14-flowered; phyllaries thin, greenish, obtuse, ciliate and sparsely villous.

34. *Coleosanthus pendulus* (Schrad.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.

Eupatorium pendulum Schrad. "Ind. Sem. Hort. Goett. 1830"; Linnaea 6: Litt. Ber. 72. 1831.

Bulbostylis pendula DC. Prodr. 5: 138. 1836.

Brickellia pendula A. Gray, Pl. Wright. 1: 85. 1852.

Morelos and Mexico to Oaxaca; type from Mexico, without definite locality.

Fruticose, 2 to 3 meters high, griseous-tomentellous and glandular or scabrid; leaf blades 2.5 to 8 cm. long, thin, crenate-serrate to subentire, reticulate, thinly pilosulous to tomentulose beneath; heads 1.4 to 2 cm. high, about 12-flowered, thyrsoïd-paniculate, more or less secund, pedicellate; phyllaries stipitate-glandular, appressed or the outermost with slightly loose tips.

34a. *Coleosanthus pendulus squarrosus* (Robins. & Seat.) Blake.

Brickellia squarrosa Robins. & Seat. Proc. Amer. Acad. 28: 108. 1893.

Brickellia pendula squarrosa Robinson, Mem. Gray Herb. 1: 87. 1917.

Known only from the type locality, near Pátzcuaro, Michoacán.

Similar; middle and outer phyllaries with subherbaceous squarrose tips.

35. *Coleosanthus seemannii* (A. Gray) Blake.

Brickellia seemannii A. Gray, Proc. Amer. Acad. 15: 30. 1879.

Known only from the type locality, Sierra Madre of northwestern Mexico.

Herbaceous or perhaps lignescent at base, scabrid-puberulous; leaf blades 3 to 4.5 cm. long, crenate-serrate, reticulate beneath; heads in a short secund raceme, nodding, 18 mm. high, about 15-flowered; phyllaries stramineous, very acute, aristate-mucronate. (Description compiled.)

36. *Coleosanthus saltillensis* (Robinson) Blake.

Brickellia saltillensis Robinson, Proc. Amer. Acad. 43: 37. 1907.

Known only from the type locality, near Saltillo, Coahuila.

Herbaceous or suffrutescent (?) at base, scabrid-pubescent; leaf blades 3.5 to 6 cm. long, reticulate beneath and scabrid-puberulous chiefly along the veins; heads thyrsoïd-panicled, few, nodding, 16 mm. high, 14 to 16-flowered; phyllaries thin, green or purple-tinged, acuminate, sparsely pubescent.

37. *Coleosanthus squarrosus* (Cav.) Blake.

Eupatorium squarrosus Cav. Icon. Pl. 1: 66. pl. 98. 1791.

Coleosanthus cavanillesii Cass. Bull. Soc. Philom. 1817: 67. 1817.

Rosalesia glandulosa Llave in Llav. & Lex. Nov. Veg. Descrip. 1: 14. 1824.

Eupatorium rosalesia DC. Prodr. 5: 183. 1836.

Bulbostylis cavanillesii DC. Prodr. 5: 138. 1836.

Brickellia cavanillesii A. Gray, Pl. Wright. 1: 85. 1852.

Brickellia rosalesia Benth. & Hook.; Hemsli. Biol. Centr. Amer. Bot. 2: 106. 1881.

Coleosanthus glandulosus Kuntze, Rev. Gen. Pl. 1: 328. 1891.

Brickellia squarrosa Robinson, Mem. Gray Herb. 1: 90. 1917. Not *B. squarrosa* Robins. & Seat. 1893.

Durango to Michoacán, Puebla, and Mexico; type from Mexico, without definite locality.

Frutescent or fruticose, about 3 meters high, sordid-puberulous, subglabrate; leaf blades triangular-ovate to broadly ovate, 3.5 to 9 cm. long, thin, crenate-serrate, reticulate beneath and puberulous or usually griseous-tomentulose;

heads 17 mm. high, about 25-flowered, nodding, in a loose panicle, on slender pubescent and stipitate-glandular pedicels; phyllaries acuminate, at least the outer glandular. "Gobernadora" (Puebla); "atanasia amarga" (Jalisco, Valley of Mexico); "prodigiosa" (Urbina); "hierba del becerro" (San Luis Potosí, Valley of Mexico); "hierba dulce" (Ramírez); "atanasia" (Oaxaca).

The plant is reported to contain a glucoside, brickelline. It is employed popularly as a vermifuge and febrifuge, and also as a remedy for diarrhea and affections of the stomach.

37a. *Coleosanthus squarrosus oligadenus* (Robinson) Blake.

Brickellia squarrosa oligadena Robinson, Mem. Gray Herb. 1: 92. f. 70, β. 1917.

Known only from the type locality, Hacienda Coahuayula, Michoacán.

Similar; pedicels griseous-pubescent, nearly or quite lacking the stipitate glands; outer phyllaries griseous-pubescent, not glandular.

38. *Coleosanthus botterii* (Robinson) Blake.

Brickellia botterii Robinson, Mem. Gray Herb. 1: 93. f. 72. 1917.

Known only from the type locality, Orizaba, Veracruz.

Fruticose, sordid-tomentulose, glabrescent; leaf blades oblong-ovate or triangular-ovate, 4 to 6 cm. long, crenulate, scarcely reticulate, griseous-tomentulose beneath; heads 13 mm. high, about 16-flowered, in a pyramidal panicle, mostly nodding, on slender stipitate-glandular pedicels; phyllaries pilosulous, the outer glandular.

39. *Coleosanthus adenocarpus* (Robinson) Arthur, Torreya 22: 30. 1922.

Brickellia adenocarpa Robinson, Mem. Gray Herb. 1: 93. f. 73. 1917.

Oaxaca; type from Rancho de Calderón. Guatemala.

Slightly lignescent perennial, crisp-puberulous, glabrescent; leaf blades ovate, 3.5 to 5.4 cm. long; heads 18 mm. high, about 22-flowered, clustered at tips of branches in convex cymes, on griseous-villous or tomentose pedicels; phyllaries attenuate, appressed or somewhat squarrose, the outer villous.

39a. *Coleosanthus adenocarpus glandulipes* (Robinson) Blake.

Brickellia adenocarpa glandulipes Robinson, Mem. Gray Herb. 1: 94. f. 73, β. 1917.

Chiapas. Guatemala; type from Quezaltenango.

Similar; pedicels glandular-puberulous; outer phyllaries sordid-glandular.

40. *Coleosanthus pacayensis* Coulter, Bot. Gaz. 20: 46. 1895.

Brickellia pacayensis Coulter, Bot. Gaz. 16: 98. 1891.

Brickellia hebecarpoides Robinson, Proc. Amer. Acad. 36: 486. 1901.

Michoacán and Morelos to Veracruz and Oaxaca. Guatemala to Nicaragua; type from Pacaya, Guatemala.

Suffrutescens to fruticose, 1 to 3 meters high, from griseous-tomentose to densely stipitate-glandular; leaf blades ovate, 4 to 7 cm. long, reticulate; heads 1 to 1.4 cm. high, 22 to 25-flowered, paniculate, on densely stipitate-glandular pedicels; phyllaries glandular-pubescent.

41. *Coleosanthus floribundus* (A. Gray) Kuntze, Rev. Gen. Pl. 1: 328. 1891.

Brickellia floribunda A. Gray, Pl. Wright. 2: 73. 1853.

Chihuahua and Sonora; type collected near Santa Cruz, Sonora. New Mexico and Arizona.

Suffrutescens, 1 to 1.5 meters high, stipitate-glandular, aromatic; leaf blades triangular-ovate, 4 to 13 cm. long, coarsely dentate-serrate, scarcely reticulate, green, glandular-punctate, subglabrous; heads 1 cm. high, about 15-flowered, panicled; inner phyllaries substramineous, the outer herbaceous, densely stipitate-glandular.

42. *Coleosanthus argutus* (Robinson) Blake.*Brickellia arguta* Robinson, Mem. Gray Herb. 1: 102. f. 79. 1917.

Northern Baja California. Southern California; type locality not definitely stated.

Fruticose, glandular-pubescent; leaf blades ovate, about 1.5 cm. long, coriaceous, reticulate, sharply toothed; heads 13 mm. high, about 15 mm. wide, about 50-flowered, solitary at tips of branches; outer phyllaries coriaceous-herbaceous, lance-ovate.

43. *Coleosanthus brandegei* (Robinson) Blake.*Brickellia brandegei* Robinson, Mem. Gray Herb. 1: 106. f. 82. 1917.

Baja California and Espiritu Santo Island; type from La Paz.

Fruticose, densely glandular-puberulous; leaf blades broadly ovate, 1.4 to 2.5 cm. long, obtuse, subcoriaceous, crenate-dentate, griseous-puberulous, reticulate; panicle terminal, few-headed; heads 1 cm. high, about 28-flowered. (Description compiled.)

44. *Coleosanthus macromeris* (Robinson) Blake.*Brickellia macromera* Robinson, Mem. Gray Herb. 1: 107. f. 83. 1917.

Known only from the type locality, head of Concepción Bay, Baja California.

Fruticose, whitish-barked, hirtellous, with very long internodes; leaf blades 1.5 to 3 cm. long, chartaceous, hirtellous, slightly reticulate beneath; heads 1.4 cm. high, pedicellate, in few-headed terminal umbellate panicles. (Description compiled.)

45. *Coleosanthus peninsularis* (T. S. Brandeg.) Blake.*Brickellia peninsularis* T. S. Brandeg. Zoe 5: 160. 1903.

Baja California and Socorro Island; type from La Chuparosa.

Frutescent, griseous-scabrid-pubescent and glandular, about 2.5 meters high; leaf blades ovate, 3 to 8 cm. long, chartaceous, reticulate, griseous-puberulous; heads corymbose-panicled, 14 mm. high, about 30-flowered; phyllaries acute to acuminate, the outer glandular-puberulous, recurved at tip.

46. *Coleosanthus rhomboideus* Greene, Erythra 1: 54. 1893.*Brickellia rhomboidea* Greene, Pittonia 2: 103. 1890.

Known only from the type locality and vicinity, Guaymas, Sonora.

Fruticose, whitish-barked, puberulous; leaf blades deltoid-ovate to broadly rhombic-ovate, 3 to 6 cm. long, rather thin, entire or bluntly undulate-serrate, slightly puberulous; heads umbellate-panicled, 12 mm. high, about 50-flowered, on stipitate-glandular pedicels 1 to 4 cm. long; phyllaries acute (outer) to obtuse.

47. *Coleosanthus lanatus* (DC.) Kuntze, Rev. Gen. Pl. 1: 328. 1891.*Bulbostylis lanata* DC. Prodr. 7: 268. 1838.*Bulbostylis rigida* Hook. & Arn. Bot. Beechey Voy. 297. 1840.*Brickellia lanata* A. Gray, Pl. Wright. 1: 84. 1852.

Jalisco, Guanajuato, and (?) Tepic; type from vicinity of Guanajuato.

Suffrutescent, canescent-lanate; leaf blades oblong to oval, 2.5 to 5.5 cm. long, coarsely serrate, coriaceous, canescent-lanate and reticulate beneath, narrowed at base, very short-petioled; heads in a narrow panicle, solitary in the upper axils, 1.5 cm. high, about 50-flowered; phyllaries strongly graduate, ovate to oblong, arachnoid-ciliate, chiefly obtuse and mucronulate, usually purplish.

47a. *Coleosanthus lanatus microdontus* (Robinson) Blake.*Brickellia lanata microdonta* Robinson, Mem. Gray Herb. 1: 119. f. 94, β . 1917.

Colima and Jalisco; type from Colima.

Leaves sessile, cordate at base and more or less amplexicaul, merely denticulate.

21. **DYSCRITOTHAMNUS** Robinson, Contr. Gray Herb. n. ser. 65: 25.
pl. 1. 1922.

1. **Dyscritothamnus filifolius** Robinson, Contr. Gray Herb. n. ser. 65: 26.
pl. 1. 1922.

Known only from the type locality, between Las Ajuntas and Las Ranas, near boundary between Guanajuato and Hidalgo.

Shrub 30 cm. high, glabrous; leaves alternate, nearly filiform, 2 to 3 cm. long, 0.5 to 0.8 mm. wide, nerveless; heads few, in terminal cymose panicles, 12 to 13 mm. high, about 10-flowered; phyllaries 2 or 3-seriate, somewhat graduate, lanceolate, acuminate, subscarious; receptacle paleaceous; corollas all tubular, very slightly zygomorphous; achenes obovoid, villous-hirsute, 2.5 mm. long; pappus of numerous unequal bristles, plumose below. (Description compiled.)

This genus is perhaps more closely allied to the Asterieae than to the Eupatorieae.

22. **SELLOA** Spreng. Nov. Prov. Hal. 36. 1819.

1. **Selloa glutinosa** Spreng. Nov. Prov. Hal. 36. 1819.

Gymnosperma glutinosum Less. Syn. Gen. Comp. 194. 1832.

Gymnosperma corymbosum DC. Prodr. 5: 312. 1836.

Gymnosperma multiflorum DC. Prodr. 5: 312. 1836.

Gymnosperma scoparium DC. Prodr. 5: 312. 1836.

Chihuahua to Chiapas. Texas to Arizona; type a cultivated plant, wrongly ascribed to Brazil.

Woody below, much branched, 1 meter high or less, glutinous, essentially glabrous; leaves alternate, sessile, often with fascicles in their axils, linear to narrowly elliptic-lanceolate, 2 to 7 cm. long, 2 to 6 mm. wide, triplinerved, punctate, entire; heads yellow, about 4 mm. high, in dense corymbose-panicked cymes; phyllaries pale, subcoriaceous, obtuse, with narrow scarious margin, sometimes obscurely herbaceous-tipped; ligules about 6, not exceeding disk; disk flowers about 6; achenes oblong, puberulous, 4 or 5-ribbed; pappus none. "Jarilla" (Nuevo León); "mota" (Aguascalientes); "mariquita," "tatalencho" (Zacatecas); "motita" (San Luis Potosí); "cola de zorra" (Chihuahua); "xonequitl" (Nahuatl); "hierba pegajosa" (Nuevo León); "yucundede" (Oaxaca, Mixtec, *Seler*); "zazal" (Mexico); "pegajosa," "escobilla" (Valley of Mexico).

In popular medicine a decoction of the plant is employed as a remedy for diarrhea, and a solution of the gum is used externally as a remedy for rheumatism, ulcers, etc.

23. **GUTIERREZIA** Lag. Gen. & Sp. Nov. 30. 1816.

Herbaceous to suffruticose, low, much branched, more or less glutinous; leaves alternate, linear-filiform to oblanceolate, punctate, 1-nerved or rarely triplinerved, entire; heads small or very small, yellow, cymose-panicked; involucre graduate, few-seriate, of coriaceous, often green-tipped phyllaries; achenes turbinate or obconic, silky; pappus of about 10 linear-oblong to linear-lanceolate, scarious-paleaceous, persistent squamellae, as long as the achene or usually shorter, in the ray about half as long as in the disk (in our species).

Heads very small, cylindric; ray flowers 1 or 2, disk flowers 1 to 3.

Heads sessile, fasciculate in glomerules of 2 to 5; rays solitary; disk flowers 1 or 2.....1. **G. lucida**.

Heads often pediceled, not fasciculate-glomerate; rays 2; disk flowers 2 or 3.

2. **G. digyna**.

Heads turbinate to subglobose; ray flowers 3 to 12, disk flowers 1 to 12.

Involucre 2.5 to 4 mm. high; leaves linear-filiform to narrowly linear, 1.5 mm. (rarely 2.5) wide or less.

Heads slenderly cylindric-turbinate, about 1.5 mm. thick; ray flowers 4 or 5, disk flowers 1 to 3.....3. **G. microcephala**.

Heads thicker, turbinate to subglobose-turbinate, 1.5 to 3.5 mm. thick; ray flowers 3 to 12, disk flowers 2 to 12.

Leaves (at least the lower) linear-spatulate, 1 to 2.5 mm. wide.

4. *G. argyrocarpa*.

Leaves strictly linear or linear-filiform, 1.5 mm. wide or less.

Heads subglobose-turbinate; flowers of ray and disk each 7 to 12; phyllaries with conspicuous broad and short herbaceous tips.

5. *G. californica*.

Heads turbinate; flowers of ray and disk each 3 to 8; phyllaries with narrower and more obscure herbaceous tips.---6. *G. sarothrae*.

Involucre 5 to 6 mm. high; leaves linear-spatulate or linear-oblanceolate, 2 to 6 mm. wide-----7. *G. grandis*.

1. *Gutierrezia lucida* Greene, Fl. Franc. 361. 1897.

Xanthocephalum lucidum Greene, Pittonia 2: 282. 1892.

Gutierrezia glomerella Greene, Pittonia 4: 54. 1899.

Chihuahua (?) and Coahuila to Zacatecas. Colorado to Texas, Arizona, and California; type from Mohave Desert, California.

Suffruticose, up to 60 cm. high; leaves linear-filiform to narrowly linear-oblanceolate, 2 to 5.5 cm. long, 2.5 mm. wide or less, sparsely scabridulous; heads fasciculate-cymose-panicled, 2.5 to 4.5 mm. long, about 1 mm. thick.

2. *Gutierrezia digyna* Blake, Contr. U. S. Nat. Herb. 22: 59. 1924.

Known only from the type locality, San Luis Mountains, Sonora (?), along Arizona boundary line.

Suffrutescens, about 30 cm. high; lower leaves oblanceolate or spatulate-linear, 1.7 to 3.5 cm. long, 3 to 4.5 mm. wide, the upper linear or very narrowly spatulate-linear; heads corymbosely cymose-panicled.

3. *Gutierrezia microcephala* (DC.) A. Gray, Mem. Amer. Acad. n. ser. 4: 74. 1849.

Brachyris microcephala DC. Prodr. 5: 313. 1836.

?*Gutierrezia haenkei* Schultz Bip. Flora 38: 115. 1855.

Gutierrezia euthamiae microcephala A. Gray, Syn. Fl. 1²: 115. 1884.

Gutierrezia filifolia Greene, Pittonia 4: 55. 1899.

Chihuahua and Coahuila; type from Saltillo, Coahuila. Idaho to Arizona.

Suffruticose, about 35 cm. high, hirtellous, corymbosely branched above; leaves linear-filiform, 3 cm. long, 1 mm. wide or less; heads often pediceled, about 3.5 mm. high; phyllaries with rather conspicuous narrow greenish tips.

4. *Gutierrezia argyrocarpa* Greenm. Proc. Amer. Acad. 40: 35. 1904.

Known only from the type locality, chalk bluffs of Tula, Hidalgo.

Suffruticose, hirtellous, about 30 cm. high; leaves linear-spatulate or the upper linear, 1 to 1.5 cm. long, scabridulous on margin; heads turbinate, about 3.5 mm. high and 2.5 mm. thick, mostly pediceled, cymose-panicled; rays 5 or 6; disk flowers 8 to 12.

5. *Gutierrezia californica* (DC.) Torr. & Gray, Fl. N. Amer. 2: 193. 1842.

Brachyris californica DC. Prodr. 5: 313. 1836.

Chihuahua. California and Arizona; type from California.

Suffrutescens, the stem glabrous to hirtellous; heads rather few, usually not glomerate, about as thick as long; phyllaries conspicuously green-tipped; ray and disk flowers each 7 to 12.

6. *Gutierrezia sarothrae* (Pursh) Britt. & Rusby, Trans. N. Y. Acad. 7: 10. 1887.

Solidago sarothrae Pursh, Fl. Amer. Sept. 540. 1814.

Brachyris euthamiae Nutt. Gen. Pl. 2: 163. 1818.

Gutierrezia euthamiae Torr. & Gray, Fl. N. Amer. 2: 193. 1842.

Chihuahua to Nuevo León; Baja California. Western North America; type from the plains of the Missouri.

Suffrutescent or suffruticose, hirtellous-puberulent, bushy-branched, 40 cm. high or less; leaves linear-filiform, 2 to 4 cm. long, 1 mm. (rarely 1.5 mm.) wide or less, scaberulous; heads very numerous, corymbosely cymose-panicled, 4 to 6 mm. high, 2 to 3 mm. thick; phyllaries with narrow, often obscure, green tips. "Hierba de San Nicolás" (Nuevo León); "hierba de víbora," "coyaye" (New Mexico).

A decoction of the plant is reported to be used in New Mexico as an emmenagogue and as a remedy for gastric disturbances. In the southwestern United States this and related species are known variously as "yellow-weed," "brown-weed," "sheep-weed," "broom-weed," and "snake-weed." The plants are often very abundant upon the plains, and their abundance usually indicates that the land has been over-grazed, especially by sheep.

7. *Gutierrezia grandis* Blake, Contr. U. S. Nat. Herb. 22: 592. pl. 55. 1924.

Coahuila and Nuevo León; type from Icamole, Nuevo León.

Suffruticose, 30 cm. high or more, strongly glutinous, scabridulous; leaves chiefly linear-oblancoelate, 2.5 to 4.5 cm. long, 2 to 6 mm. wide, triplinerved; heads turbinate or obovoid, larger than in any other of our species, scattered or glomerate; rays 5 to 9; disk flowers 3 to 7.

DOUBTFUL SPECIES.

GUTIERREZIA LINEARIFOLIA Lag. Gen. & Sp. Nov. 30. 1816. This species, the type of the genus, was originally ascribed to Mexico. The description does not well agree with any Mexican species, however, and Gray identifies it with much probability with the Chilean plant later described as *Brachyris paniculata* DC.

24. *APLOPAPPUS* Cass. Dict. Sci. Nat. 56: 168. 1828.

Herbs or shrubs, often glutinous; leaves alternate (in one species opposite), linear-filiform to obovate, entire to pinnatifid or bipinnatifid; heads small or medium, radiate or discoid, yellow, the rays and more rarely the disk sometimes becoming purplish in age; involucre 2 to 7-seriate, scarcely or strongly graduated, the phyllaries dry, usually thin-margined, sometimes with herbaceous tips, not in distinct vertical ranks; achenes usually pubescent, slender, sometimes ribbed; pappus of numerous often unequal bristles.

Leaves all linear or linear-filiform, rarely spatulate-linear, entire, 3 mm. wide or less.

Pappus bright white; heads solitary at tips of branchlets, radiate, comparatively large, the disk 1 cm. wide or more; involucre 7 to 13 mm. high, the phyllaries lanceolate, scarcely graduated, with subherbaceous center and tip.

Leaves 2 to 4 cm. long; ligules 1 to 2 cm. long; involucre 10 to 13 mm. high.

1. *A. linearifolius*.

Leaves 1 to 2 cm. long; ligules 5 to 10 mm. long; involucre 7 to 10 mm. high.....1a. *A. linearifolius interior*.

Pappus brownish or dull whitish; heads mostly corymbosely-panicled or racemose-panicled, sometimes solitary, usually discoid, the disk 8 mm. wide or less (in *A. parrasanus* becoming 11 to 12 mm. wide); involucre 8 mm. high or less, usually strongly graduated.

Heads solitary at tips of short leafy branchlets, these sometimes cymosely arranged.

Leaves not punctate; young growth densely hirtellous....9. *A. purpusii*.

Leaves strongly glandular-punctate; young growth glabrous.

Leaves linear-filiform, subterete.

Involucre about 6-seriate, 6 to 7 mm. high; rays present.

4. *A. palmeri*.

Involucre about 4-seriate, 5 mm. high or less; rays wanting.

6. *A. propinquus*.

Leaves linear or linear-spatulate, distinctly flattened; phyllaries all linear-lanceolate to oblong, acute to acuminate.

Phyllaries linear-lanceolate or linear-subulate, acuminate; leaves 1 to 1.5 mm. wide.....7. *A. laricifolius*.

Phyllaries oblong or oblong-lanceolate, acute; leaves 0.6 to 0.9 mm. wide.....8. *A. parrasanus*.

Heads distinctly cymose-panicled, rarely racemose-panicled.

Stem densely tomentose.....12. *A. pyramidatus*.

Stem not tomentose.

Leaves linear-filiform, terete or subterete, conspicuously impressed-punctate (less so in no. 4).

Involucre 6 to 7 mm. high, about 6-seriate, the inner phyllaries narrowly linear; rays present.....4. *A. palmeri*.

Involucre 3 to 6 mm. high, about 4-seriate, the inner phyllaries oblong or linear-oblong; rays wanting (rarely solitary in no. 5).

Involucre 3 to 4 mm. high, the phyllaries with short greenish tips; heads subsessile, in close cymose clusters, these paniculately or subracemously arranged.....5. *A. sonoriensis*.

Involucre 4 to 6 mm. high, the phyllaries without distinct greenish tips; heads pedicellate.

Bracts in distinct vertical ranks; heads 5 to 7-flowered.

(*Chrysothamnus paniculatus*.)

Bracts not in distinct vertical ranks; heads 8 to 12-flowered.

6. *A. propinquus*.

Leaves linear or linear-spatulate, flat, inconspicuously or not punctate (except in nos. 10 and 4).

Leaves 5 to 15 mm. long; heads usually with 1 or 2 rays.

10. *A. monactis*.

Leaves 2 cm. long or more; heads discoid.

At least the middle phyllaries with definite greenish tips.

Middle phyllaries obtuse or rounded; involucre 4 to 5 mm. high.

14. *A. drummondii*.

Middle phyllaries acute; involucre 5 to 7 mm. high.

20. *A. fasciculatus*.

Phyllaries without definite greenish tips, but sometimes obscurely greenish toward tip.

Leaves obscurely or not punctate, 2 mm. wide or more.

15. *A. heterophyllus*.

Leaves strongly punctate, 1.2 mm. wide or less...4. *A. palmeri*.

Leaves more than 3 mm. wide (if rarely less, not entire), usually toothed or pinnatifid.

Leaves opposite throughout; phyllaries about 2-seriate, subequal, the outer broadly oval-oblong, about 2.5 mm. wide.....2. *A. oppositifolius*.

Leaves alternate; phyllaries several-seriate, graduate, much narrower.

Leaves entire.

Plant tomentose.....21. *A. canus*.

Plant not tomentose.

Leaves cuneate to linear-elliptic, 7 times as long as wide or less.

Leaves cuneate to obovate, 2 cm. long or less.

3. *A. cuneatus spathulatus*.

Leaves linear-elliptic to obovate, 2.5 to 6 cm. long.

Heads in a virgate panicle; involucre 7 to 9 mm. high, strongly graduate, many-seriate.....23. *A. orcuttii*.

Heads in a flattish terminal corymbiform panicle; involucre 5 mm. high, few-seriate.....11. *A. parishii*.

Leaves linear to linear-spatulate, more than 8 times as long as wide.

Involucre 5 to 7 mm. high, the middle phyllaries acute and with definite green tips.....20. *A. fasciculatus*.

Involucre 5 mm. high or less, the middle phyllaries obtuse or rarely acute, without definite greenish tips....15. *A. heterophyllus*.

Leaves toothed or pinnatifid.

Plant tomentose.....21. *A. canus*.

Plant not tomentose.

Involucre 12 to 15 mm. high, the phyllaries oblong-linear, appressed, without loose green tips.

Leaves oval or oblong-obovate, with broad clasping base.

24. *A. berberidis*.

Leaves cuneate-obovate, narrowed to the base.....25. *A. cruentus*.

Involucre 10 mm. high or less.

Heads solitary at tips of stem and branches.

Stem and leaves essentially glabrous, resinous; involucre 4.5 mm. high, the outer phyllaries ciliate, not glandular-granular.

13. *A. vernicosus*.

Stem and leaves glandular-granular or pubescent; involucre 5 to 10 mm. high, the phyllaries not ciliate, densely glandular-granular.

Leaves obovate or cuneate-obovate, merely toothed, obtuse, nearly uniform in shape; phyllaries with spreading or reflexed herbaceous tips 1.5 to 2 mm. long; plant very densely glandular-pubescent.....28. *A. arenarius*.

Leaves linear to obovate, usually acute, at least the lower usually pinnatifid, the upper usually different in shape and toothed from the lower; herbaceous tips of the phyllaries appressed or short and spreading.

Plant dull green or cinereous, densely glandular-pubescent or hispid-pilose; upper and branch leaves mostly oblong-linear or oblanceolate, toothed.

26. *A. spinulosus scabrellus*.

Plant bright light green, sparsely glandular-granular; upper and branch leaves linear, entire or toothed.

27. *A. junceus*.

Heads closely cymose or virgate-panicled.

Heads small, few-flowered, 5.5 mm. high or less; leaves 1 cm. long or less.....13. *A. vernicosus*.

Heads larger, many-flowered; leaves more than 1 cm. long.

Heads in elongate, virgate or pyramidal panicles.

Stem rough-pubescent; leaves sharply toothed.

22. *A. squarrosus*.

Stem essentially glabrous; leaves merely denticulate.

23. *A. orcuttii*

Heads in close cymose clusters at tips of stem and branches.

Phyllaries with acute or acuminate spreading herbaceous tips.

19. *A. tridentatus*.

Phyllaries with appressed tips.

Leaf rachis narrowly linear, of the same breadth as the lobes.

Leaves with one or two short lobes or teeth above.

14. *A. drummondii*.

Leaves regularly pinnatifid.....18. *A. fruticosus*.

Leaf rachis much broader than the breadth of the lobes or teeth.

Leaves chiefly cuneate or cuneate-oblongate, with few short teeth.....16. *A. venetus*.

Leaves chiefly linear-spatulate or spatulate-oblongate, incise-toothed or pinnatifid.....17. *A. hartwegii*.

1. *Aplopappus linearifolius* DC. Prodr. 5: 347. 1836.

Stenotus linearifolius Torr. & Gray, Fl. N. Amer. 2: 238. 1842.

Stenopsis linearifolia Rydb. Bull. Torrey Club 27: 617. 1900.

Zapato Chino, Baja California (*Brandegee*, according to Hall). California.

Shrub 1.5 meters high or less, somewhat resinous; leaves crowded, linear, acute, punctate; peduncles short, nearly naked; inner phyllaries with scarious margins; achenes silky-pubescent; pappus soft.

1a. *Aplopappus linearifolius interior* (Coville) Jones, Proc. Calif. Acad. II. 5: 697. 1895.

Aplopappus interior Coville, Proc. Biol. Soc. Washington 7: 65. 1892.

San Pedro Mártir, Baja California (*Brandegee*, according to Hall). California to Utah and Arizona; type from Inyo County, California.

Similar, but with shorter leaves, rays, and involucre.

2. *Aplopappus oppositifolius* (A. Gray) Blake.

Bigelovia oppositifolia A. Gray, Proc. Amer. Acad. 15: 32. 1879.

Known only from the type locality, San Luis Potosí.

Low shrub, resinous and obscurely puberulous; leaves opposite; petioles 3 to 5 mm. long; blades ovate-elliptic or rhombic-elliptic, 1.5 cm. long, 7 mm. wide, acutish, cuneate at base, thick, about 7-toothed above the middle, dotted; heads solitary at tips of branches, subsessile, discoid, 1 cm. high; involucre 2-seriate, sometimes with one or two small outer bracts, subequal, 8 mm. high, the phyllaries oblong, acute, striate, glandular-granular, ciliolate above, without herbaceous tips; flowers 20 to 25; achenes puberulous.

3. *Aplopappus cuneatus spathulatus* (A. Gray) Blake.

Bigelovia spathulata A. Gray, Proc. Amer. Acad. 11: 74. 1876.

Ericameria cuneata spathulata H. M. Hall, Univ. Calif. Publ. Bot. 3: 352. 1907.

Northern Baja California; type from Cantillas Canyon. California and Arizona.

Spreading shrub, about 30 cm. high, glabrous, densely glandular-punctate; leaves cuneate or obovate, 1 to 2 cm. long, 3 to 10 mm. wide, thick, entire, usually retuse; heads several in terminal cymose panicles, discoid, turbinate; involucre 6 to 8 mm. high, graduate, of acutish, lanceolate or linear-lanceolate phyllaries without herbaceous tips; achenes silky-pubescent; pappus brownish.

4. *Aplopappus palmeri* A. Gray, Proc. Amer. Acad. 11: 74. 1876.

Chrysoma palmeri Greene, Erythea 3: 12. 1895.

Ericameria palmeri H. M. Hall, Univ. Calif. Publ. Bot. 3: 53. 1907.

Northern Baja California; type from Tecate Mountains. California.

Low shrub, about 0.5 meter high, nearly glabrous, densely glandular-punctate; leaves very narrowly linear or linear-filiform, 1 to 3.5 cm. long, 1.2 mm. wide or less, those of the axillary fascicles reduced and often subterete; heads numerous, in an elongate panicle or racemously arranged, usually pedicellate; involucre 6 to 7 mm. high, strongly graduate, narrowly turbinate; rays several, short; achenes silky.

5. *Aplopappus sonoriensis* (A. Gray) Blake.

Ericameria diffusa Benth. Bot. Voy. Sulph. 23. 1844. Not *Aplopappus diffusus* DC. 1836.

Solidago diffusa A. Gray, Proc. Amer. Acad. 5: 159. 1861.

Linosyris sonoriensis A. Gray, Proc. Amer. Acad. 8: 291. 1870.

Bigelovia diffusa A. Gray, Proc. Amer. Acad. 8: 640. 1873.

Baja California and islands, Sinaloa, and Sonora; type from Yaqui River, Sonora.

Frutescent, 60 cm. high or less, glabrous, punctate, much branched, very leafy; leaves linear-filiform, 3.5 cm. long or less, 1 mm. wide or less, subterete, or the larger sometimes flattish above, those of the branches much reduced; heads numerous, mostly sessile, cymose-clustered, usually forming broad panicles; involucre 3 to 4 mm. high, few-seriate, the oblong or lance-oblong phyllaries with short greenish tips; rays 0 to 2, small; disk flowers 4 or 5; achenes silky. "Hierba del pasmo" (Sonora, Baja California).

6. *Aplopappus propinquus* Blake, nom. nov.

Bigelovia brachylepis A. Gray, Bot. Calif. 1: 614. 1876.

Chrysoma brachylepis Greene, Erythea 3: 12. 1895.

Ericameria brachylepis H. M. Hall, Univ. Calif. Publ. Bot. 3: 56. 1907.

Haplopappus brachylepis H. M. Hall, Univ. Calif. Publ. Bot. 7: 273. 1919.

Not *H. brachylepis* Phil. 1894.

Northern Baja California. California; type from Larken's Station, northeast of San Diego.

Shrub 2 meters high or less, much branched, densely glandular-punctate; leaves linear-filiform, 1 to 2.5 cm. long, 1.3 mm. wide or less, often with fascicles in their axils, the larger sometimes flattish above; heads narrowly panicle or subracemose, pedicellate, discoid, 8 to 12-flowered; involucre 4 to 6 mm. high, few-seriate, the phyllaries lanceolate or linear-lanceolate, with linear central gland; achenes silky-pilose.

7. *Aplopappus laricifolius* A. Gray, Pl. Wright. 2: 80. 1853.

Chrysoma laricifolia Greene, Erythea 3: 11. 1895.

Bigelovia nelsonii Fernald, Proc. Amer. Acad. 36: 505. 1901.

Ericameria nelsonii Blake, Contr. Gray Herb. n. ser. 52: 26. 1917.

Chihuahua. Arizona to Texas; type from Guadalupe Pass, New Mexico.

Much-branched shrub about 30 cm. high, densely glandular-punctate, densely leafy; leaves linear or narrowly linear-spatulate, 1 to 1.5 cm. long, 2 mm. wide or less, thick, flat; heads turbinate, becoming subhemispheric, solitary at tips of short leafy branches, these usually cymose-clustered at apex of stem and branches; involucre about 5 mm. high, little graduate, the phyllaries linear-lanceolate, acuminate, with a linear dorsal gland; rays 7 or less, exceeding disk; achenes silky.

8. *Aplopappus parrasanus* Blake.

Ericameria parrasana Blake, Contr. Gray Herb. n. ser. 52: 26. 1917.

Known only from the type locality, Sierra de Parras, Coahuila.

Branching shrub, densely glandular-punctate, very leafy; leaves linear, 6 to 9 mm. long, 0.6 to 0.9 mm. wide, flattish above, not fascicled; heads hemispheric, solitary, terminating short leafy branches; involucre 4 mm. high, slightly graduate, the phyllaries narrowly oblong or oblong-lanceolate, acute, with lanceolate appressed subherbaceous tips; rays about 10, oval, 5 mm. long; achenes silky.

9. *Aplopappus purpusii* (T. S. Brandeg.) Blake.*Ericameria purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 191. 1911.

Known only from the type locality, Cerro de Macho, Coahuila.

Low branching shrub, finely hirtellous on the younger parts; larger leaves linear-subulate, 5 to 7 mm. long, 0.6 mm. wide, stiff, spreading, mucronulate, bearing fascicles in their axils, those of the branches appressed or erect, smaller, decurrent, with thick midrib; heads solitary, terminating leafy branchlets, discoid, 8 to 10-flowered, turbinate-hemispheric; involucre 5 mm. high, the phyllaries ovate to oblong, acute; achenes silky.

10. *Aplopappus monactis* A. Gray, Proc. Amer. Acad. 19: 1. 1883.*Ericameria monactis* McClatchie, Erythea 2: 124. 1894.*Tumionella monactis* Greene, Leaflets 1: 173. 1906.

Northern Baja California. California and Nevada; type from borders of Mohave Desert.

Much-branched shrub 1 meter high or less, slightly pubescent, more or less punctate, very leafy; leaves linear or linear-oblancoate, 5 to 15 mm. long, 1.5 mm. wide or less, even the reduced leaves of the branches distinctly flattened above; heads pediceled, cymose-panicled at tips of branches; involucre 4 mm. high, the phyllaries very few, oblong or lance-oblong, obtuse or acute; rays 0 to 2; disk flowers 5 to 8; achenes silky.

11. *Aplopappus parishii* (Greene) Blake.*Bigelovia parishii* Greene, Bull. Torrey Club 9: 62. 1882.*Chrysoma parishii* Greene, Erythea 3: 10. 1895.*Ericameria parishii* H. M. Hall, Univ. Calif. Publ. Bot 3: 55. 1907.

San Pedro Mártir, Baja California. California; type from Waterman Canyon, San Bernardino Mountains.

Shrub 2 to 5 meters high, very resinous, densely leafy; leaves linear-elliptic or elliptic-lanceolate, 2 to 6 cm. long, 3 to 10 mm. wide, entire, acute, densely punctate, sessile; heads numerous, discoid, about 10-flowered, forming terminal flattish cymose panicles; involucre 5 mm. high, the phyllaries lanceolate or lance-oblong, acute or obtusish; achenes minutely silky.

12. *Aplopappus pyramidatus* (Robins. & Greenm.) Blake.*Bigelovia pyramidata* Robins. & Greenm. Proc. Amer. Acad. 32: 43. 1896.

Known only from the type locality and vicinity, Oaxaca City, Oaxaca.

Frutescent, 1 meter high or less; stem densely cinereous-tomentose, in age glabrescent; leaves linear, 1 to 2.8 cm. long, 1.5 mm. wide or less, mucronulate, revolute-margined, tomentose, glabrate above; heads discoid, 9-flowered, subsessile, mostly solitary in the axils of leafy bracts 1 cm. long or less, forming long spikelike panicles; involucre 5 mm. high, about 3-seriate, the phyllaries lanceolate to linear-lanceolate, acute to acuminate, somewhat glandular and sparsely pilose, without herbaceous tips; achenes silky.

13. *Aplopappus vernicosus* T. S. Brandeg. Proc. Calif. Acad. II. 2: 168. 1889.

Known only from the type locality, El Rosario, Baja California.

Shrubby, intricately branched, essentially glabrous, resinous, about 45 cm. high; leaves cuneate-obovate or rhombic-obovate, 6 to 9 mm. long, 3 to 4 mm. wide, with 2 to 6 spinulose-tipped teeth, narrowed into a petioliform entire base, coriaceous, not distinctly dotted, sometimes with fascicles in the axils; heads 1 to 3 at tips of short branchlets toward apex of stem and branches, leafy-bracted; involucre 5 mm. high, the phyllaries few, oblong or linear-oblong, obtuse, the outer ciliate below, with conspicuous green tips, the inner with obscure tips; rays 5; disk flowers 6; achenes silky.

14. *Aplopappus drummondii* (Torr. & Gray) Blake.*Linosyris drummondii* Torr. & Gray, Fl. N. Amer. 2: 233. 1842.*Bigelovia drummondii* A. Gray, Proc. Amer. Acad. 8: 639. 1873.

Isocoma drummondii Greene, *Erythea* 2: 111. 1894.

Coahuila or Nuevo León. Texas; type from Texas.

Suffruticose, about 30 cm. high, slender, resinous; leaves linear or very narrowly linear-spatulate, 2 to 5 cm. long, 1 to 2.5 mm. wide, entire or rarely with one or two teeth or short lobes; heads discoid, 18 to 30-flowered, in close terminal paniced cymes; involucre 4 to 5 mm. high, about 5-seriate, graduate, the oblong or linear-oblong, obtuse to acute phyllaries with distinct short greenish tips; achenes silky; pappus brownish.

15. *Aplopappus heterophyllus* (A. Gray) Blake in Tidestrom, *Contr. U. S. Nat. Herb.* 25: 546. 1925.

Linosyris heterophylla A. Gray, *Pl. Wright.* 1: 95. 1852.

Linosyris wrightii A. Gray, *Pl. Wright.* 1: 95. 1852.

Linosyris hirtella A. Gray, *Pl. Wright.* 1: 95. 1852.

Bigelovia wrightii A. Gray, *Proc. Amer. Acad.* 8: 639. 1873.

Isocoma heterophylla Greene, *Erythea* 2: 111. 1894.

Isocoma hirtella Heller, *Muhlenbergia* 1: 6. 1900.

Isocoma wrightii Rydb. *Bull. Torrey Club* 33: 152. 1906.

Isocoma limitanea Rose & Standl. *Contr. U. S. Nat. Herb.* 16: 18. *pl. 14.* 1912.

Isocoma oxylepis Woot. & Standl. *Contr. U. S. Nat. Herb.* 16: 180. 1913.

Chihuahua and Sonora. Colorado to Texas and Arizona; type from valley of the Rio Grande, Texas.

Suffrutescent below or suffruticose, about 60 cm. high, hirtellous to subglabrous; leaves linear to linear-oblong, 2 to 6 cm. long, 2 to 5 mm. wide, usually hispidulous along margin, entire or the lower sometimes laciniate-dentate; heads numerous, sessile or pedicellate, in terminal paniculate cymes; involucre 4 to 5 mm. high, the phyllaries about 5-seriate, strongly graduate, narrowly oblong to lance-oblong, obtuse or sometimes acute, with obscurely greenish tips; heads discoid, 7 to 15-flowered; achenes silky.

16. *Aplopappus venetus* (H. B. K.) Blake.

Baccharis veneta H. B. K. *Nov. Gen. & Sp.* 4: 68. 1820.

Aplopappus discoideus DC. *Prodr.* 5: 350. 1836.

Linosyris mexicana Schlecht. "Ind. Sem. Hort. Halens. 1839: 9. 1839;"

Linnaea 14: Litt.-Ber. 128. 1840.

Bigelovia veneta A. Gray, *Proc. Amer. Acad.* 8: 638. 1873.

Isocoma veneta Greene, *Erythea* 2: 111. 1894.

Coahuila (or Nuevo León) to Morelos; type from Cuernavaca, Morelos.

Frutescent, about 30 cm. high, more or less hirtellous; leaves cuneate or cuneate-oblong, 1 to 2.8 cm. long, 3.5 to 10 mm. wide, denticulate to lacinate-toothed with 1 to 6 pairs of spinulose-tipped teeth, usually entire below the middle, dotted; heads discoid, 23 to 30-flowered, several or numerous, mostly pedicellate, in close, usually paniced, terminal cymes; involucre 5 to 7 mm. high, the phyllaries lance-oblong to ovate or oblong, with distinctly greenish, usually acute or acutish tips; achenes densely silky. "Damiana," "falsa damiana;" "boxosdá" (San Luis Potosí).

A decoction of the plant is sometimes used in the form of baths as a remedy for rheumatism. The plant has sometimes been confused with the true damiana, *Turnera diffusa* (see page 848), and aphrodisiac properties have been wrongly ascribed to it.

17. *Aplopappus hartwegi* (A. Gray) Blake.

Bigelovia hartwegi A. Gray (*Hemsl. Biol. Centr. Amer. Bot.* 2: 115. 1881, *nomen nudum*), *Syn. Fl.* 1²: 123. 1884.

Isocoma hartwegi Greene, *Erythea* 2: 111. 1894.

Aguaascalientes and San Luis Potosí to Puebla; type from Lagos, Jalisco.

Similar to the last species, and doubtfully distinct from it; leaves narrowly oblanceolate or spatulate-oblanceolate, deeply lacinate-toothed or lobed, the lobes lanceolate or oblong-linear, 2 to 5 pairs, 1.5 to 4 mm. long.

18. *Aplopappus fruticosus* (Rose & Standl.) Blake.

Linosyris coronopifolia A. Gray, Pl. Wright. 1: 96. 1852. Not *Aplopappus coronopifolius* DC. 1836.

Bigelovia coronopifolia A. Gray, Proc. Amer. Acad. 8: 638. 1873.

Isocoma coronopifolia Greene, Erythea 2: 111. 1894.

Isocoma fruticosa Rose & Standl. Contr. U. S. Nat. Herb. 16: 18. pl. 13. 1912
Sonora. Arizona and Texas; type collected along the Rio Grande, Texas.

Suffrutescent or fruticose, 60 cm. high or less, resinous, hirtellous to glabrous; leaves linear to oblong-ovate in outline, 1.2 to 4 cm. long, 0.3 to 3 cm. wide, pinnately divided, the lobes 2 to 6 pairs, linear or linear-filiform, of the same breadth as the leaf rachis; heads discoid, about 12-flowered, crowded in terminal, usually paniced cymes; involucre 4 to 5 mm. high, the phyllaries with distinct or indistinct, obtuse, greenish tips; achenes silky.

19. *Aplopappus tridentatus* (Greene) Blake.

?*Linosyris dentata* Kellogg, Proc. Calif. Acad. 2: 16. 1863.

Bigelovia tridentata Greene, Bull. Torrey Club 10: 126. 1883.

Isocoma tridentata Greene, Erythea 2: 111. 1894.

Cedros Island and Rosalía Bay, Baja California; type from Cedros Island.

Suffruticose, branched, 30 cm. high or more, resinous, essentially glabrous; leaves cuneate to linear-spatulate, 1.5 to 2.8 cm. long, 3 to 17 mm. wide, tridentulate (rarely entire) to pinnatifid, the lobes 1 or 2 pairs, spinulose-tipped, triangular or oblong-lanceolate, shorter than or exceeding the breadth of the leaf rachis; heads discoid, about 19-flowered, pedicellate, cymose at tips of stem and branches; involucre 7 to 9 mm. high, the phyllaries lanceolate to linear-lanceolate, with conspicuous, acute or acuminate, mostly spreading, greenish tips; achenes silky.

20. *Aplopappus fasciculatus* Vasey & Rose, Proc. U. S. Nat. Mus. 11: 530. 1889.

Known only from the vicinity of the type locality, San Quintín, Baja California.

Suffrutescent, 30 cm. high and more, apparently branched only at apex, glutinous, essentially glabrous, very leafy; leaves narrowly linear-spatulate, about 2.5 cm. long, 2 to 3 mm. wide, entire, acute, bearing fascicles in their axils; heads numerous, discoid, 15 to 25-flowered, mostly pediceled, in paniced cymes; involucre 6.5 to 9 mm. high, the phyllaries oblong or ovate-oblong, acute, greenish-tipped, appressed or rarely slightly spreading at apex.

21. *Aplopappus canus* (A. Gray) Blake, Contr. U. S. Nat. Herb. 24: 86. 1922

Diplostephium canum A. Gray, Proc. Amer. Acad. 11: 75. 1876.

Corethrogyne detonsa Greene, Bull. Torrey Club 10: 41. 1883.

Corethrogyne cana Greene, Bull. Calif. Acad. 1: 223. 1885.

Hazardia cana Greene, Pittonia 1: 29. 1887.

Hazardia detonsa Greene, Pittonia 1: 29. 1887.

Hazardia serrata Greene, Pittonia 1: 30. 1887.

Guadalupe Island, Baja California (type locality). Santa Barbara Islands, California.

Shrub about 1.3 meters high, densely tomentose, the foliage sometimes glabrate on one or both sides; leaves obovate to oblanceolate or elliptic-obovate, 3 to 10 cm. long, 1 to 3 cm. wide, entire to sharply serrate, the larger often petiolate; heads numerous, paniced, sessile or pedicellate; involucre 1 to 1.5 cm. high, many-seriate, strongly graduate, more or less lanate-tomentose, the phyllaries linear-lanceolate or linear, with thick, greenish, usually appressed, acutish tips;

rays inconspicuous, yellow, changing to purple, perhaps sometimes wanting; disk flowers yellow, becoming brownish purple; achenes pubescent; pappus brown.

22. *Aplopappus squarrosus* Hook. & Arn. Bot. Beechey Voy. 146. 1833.

Hazardia squarrosa Greene, Erythea 2: 112. 1894.

Baja California (according to Greene). California.

Suffruticose at base, 1 meter high or less, the stems rough-pubescent; leaves cuneate to oblong-obovate or obovate, 1.5 to 4 cm. long, 7 to 20 mm. wide, obtuse, sessile and somewhat clasping, sharply serrate throughout with mucronulate teeth; heads racemose to pyramidal-panicled, discoid, about 20-flowered; involucre turbinate, many-seriate, 10 to 12 mm. high, the phyllaries granular, greenish-tipped, at least the outer spreading at apex; achenes nearly or quite glabrous; pappus deep brown.

23. *Aplopappus orcuttii* A. Gray, Proc. Amer. Acad. 20: 297. 1885.

Hazardia orcuttii Greene, Erythea 2: 112. 1894.

Known only from the vicinity of the type locality, Ensenada de Todos Santos, Baja California.

Suffruticose, 30 cm. high and more, resinous, essentially glabrous; leaves elliptic to obovate, 2.5 to 4.5 cm. long, 7 to 15 mm. wide, mucronulate-pointed, narrowed to the sessile base, entire or rarely slightly serrulate, impressed-glandular; heads turbinate, in narrow virgate panicles; involucre 7 to 10 mm. high, many-seriate, the phyllaries linear, with short, obtuse or acutish, greenish, densely glandular, appressed or slightly spreading tips; rays small, not exceeding disk; achenes sparsely pilose.

24. *Aplopappus berberidis* A. Gray, Syn. Fl. 1²: 126. 1884.

Hazardia berberidis Greene, Erythea 2: 112. 1894.

Coronados Islands and northern Baja California; type from Todos Santos Bay.

Suffruticose, about 0.5 meter high, the stem loosely hispid-pilose; leaves cuneate-obovate or oval-obovate, 1.8 to 4 cm. long, 8 to 17 mm. wide, obtuse, sessile and clasping, sharply serrate throughout; heads racemed or capitate-clustered at apex of stem, rarely solitary, campanulate, chiefly sessile; involucre 13 to 15 mm. high, many-seriate, the phyllaries linear-oblong, rounded, appressed, greenish and granular toward apex; rays numerous, about 6 mm. long; achenes striate, glabrous.

25. *Aplopappus cruentus* Greene, Pittonia 2: 17. 1889.

Hazardia cruenta Greene, Erythea 2: 112. 1894.

Known only from the type locality, Coronados Islands, Baja California.

Low, shrubby, loosely villous; leaves obovate or spatulate-obovate, 2 to 2.5 cm. long, 7 to 10 mm. wide, obtuse, narrowed to base, sharply spinulose-serrate above the base, thin-coriaceous; heads solitary at tips of branches, subglobose-campanulate; involucre 1.5 cm. high, the phyllaries linear or oblong-linear, obtuse, obscurely greenish and glutinous toward tip, appressed, somewhat purplish-tinged; rays numerous, yellow becoming saffron-red, the lamina about 8 mm. long.

26. *Aplopappus spinulosus scabrellus* (Greene) Blake, Contr. Gray Herb. n. ser. 52: 24. 1917.

Eriocarpum scabrellum Greene, Erythea 2: 108. 1894.

Baja California; Sonora to Guanajuato; type from Los Angeles Bay, Baja California. Colorado to New Mexico.

Herbaceous to suffruticose, 30 cm. high and more, subglabrous to densely hispid-pilose, often glandular; leaves obovate or cuneate to (upper) linear or linear-oblong, the lowest sometimes bipinnatifid, the middle and upper mostly oblanceolate or oblong-linear, toothed to pinnatifid, the teeth spinulose-tipped;

heads few to numerous, solitary at tips of stem and branches; involucre 5 to 8 mm. high, densely glandular-granular, strongly graduate, the phyllaries linear or linear-lanceolate, spinulose-tipped, with usually appressed greenish tips; rays numerous, pale yellow, the lamina about 6 mm. long; achenes densely silky. "Hierba de víbora."

This plant is sold in the markets of Coahuila as a blood purifier.

27. Aplopappus junceus Greene, Bull. Calif. Acad. 1: 190. 1885.

Eriocarpum junceum Greene, Erythea 2: 108. 1894.

Sideranthus viridis Rose & Standl. Contr. U. S. Nat. Herb. 16: 19. pl. 15. 1912.

Sonora and northern Baja California. Southern California and Arizona; type from San Diego County, California.

Suffrutescent below, up to 1 meter high, the stems slender, finely glandular-granular; lower leaves linear, about 2.5 cm. long, pinnatifid with few short lobes, the others linear, entire or few-toothed, obtuse, spinulose-mucronate, about 8 mm. long, 1 mm. wide; heads as in the last species, the involucre 5 to 8 mm. high.

28. Aplopappus arenarius Benth. Bot. Voy. Sulph. 24. 1844.

Aplopappus arenarius incisifolius I. M. Johnston, Proc. Calif. Acad. IV. 12: 1190. 1924.

?*Aplopappus arenarius rossii* I. M. Johnston, Proc. Calif. Acad. IV. 12: 1191. 1924.

Southern Baja California; type from Cape San Lucas.

Suffruticose or herbaceous, low, spreading, densely pubescent all over with mostly gland-tipped hairs; leaves cuneate to cuneate-obovate, 1 to (lowest) 3 cm. long, 4 to 12 mm. wide, usually obtuse or rounded, denticulate to lacinate-lobed with sometimes spinulose-tipped teeth; involucre larger than in the last two species, about 1 cm. high, the phyllaries densely glandular and with loose herbaceous tips.

25. CHRYSOTHAMNUS Nutt. Trans. Amer. Phil. Soc. n. ser. 7: 323. 1840.

Shrubs or undershrubs; leaves alternate, narrow, entire; heads yellow, corymbose-paniced, discoid and 5-flowered (in ours); involucre 3 to 5-seriate, graduated, the dry, sometimes herbaceous-tipped phyllaries arranged in distinct vertical rows; achenes slender, terete or angled; pappus of numerous soft or stiffish, white or brownish-tinged, slender bristles.

Plants of this genus are abundant and characteristic shrubs of the Rocky Mountain region, where they are commonly known as "rabbit-brush." The stems contain a certain percentage of rubber, but probably too little to be of commercial importance.

Branches not tomentose.

Involucre 9 to 12 mm. high; phyllaries acuminate; leaves linear or linear-spatulate, flattish, not glandular-punctate.....1. **C. pulchellus**.

Involucre 6 to 7 mm. high; phyllaries obtuse; leaves involute-filiform, subterete, densely glandular-punctate.....2. **C. paniculatus**.

Branches densely tomentose.....3. **C. latisquameus**.

1. Chrysothamnus pulchellus (A. Gray) Greene, Erythea 3: 107. 1895.

Linomyris pulchella A. Gray, Pl. Wright. 1: 96. 1852.

Bigelovia pulchella A. Gray, Proc. Amer. Acad. 8: 643. 1873.

Chihuahua. Kansas to Utah, south to Texas and Arizona; type from western Texas.

Shrub 1 meter high or less, glabrous, white-barked; leaves cuspidate-apiculate, 1 to 2.5 cm. long, 1 to 2.5 mm. wide; phyllaries strongly keeled, with lanceolate greenish tips; achenes glabrous; pappus stiffish, about 1.2 cm. long.

2. **Chrysothamnus paniculatus** (A. Gray) H. M. Hall, Univ. Calif. Publ. Bot. 3: 58. 1907.

Linosyris viscidiflora paniculata A. Gray in Torr. U. S. & Mex. Bound. Bot. 80. 1859, nomen nudum.

Bigelovia paniculata A. Gray, Proc. Amer. Acad. 8: 644. 1873.

Ericameria paniculata Rydb. Fl. Rocky Mount. 853. 1917.

Sonora. Utah and California to Arizona; type from "California."

Shrubby, 2 meters high or less, essentially glabrous, densely glandular-punctate; leaves 2 cm. long or less; phyllaries few, in 3 or 4 ranks, without green tips, not keeled; achenes densely pubescent; pappus brownish, about 6 mm. long.

3. **Chrysothamnus latisquameus** (A. Gray) Greene, Pittonia 4: 42. 1899.

Bigelovia graveolens latisquamea A. Gray, Proc. Amer. Acad. 8: 645. 1873.

Sonora. New Mexico and Arizona; type from New Mexico.

Shrub, densely and compactly whitish-tomentose; leaves linear-filiform or linear, 2 to 5 cm. long, less than 1 mm. wide; involucre 7 to 9 mm. high, the phyllaries obtuse, the outer tomentulose, the inner glabrous; achenes densely pubescent; pappus whitish, about 7 mm. long.

26. **GREENELLA** A. Gray, Proc. Amer. Acad. 16: 81. 1880.

1. **Greenella ramulosa** Greene, Pittonia 1: 302. 1889.

Central western Baja California; type from San Bartolomé Bay.

Suffrutescent perennial, about 30 cm. high, densely and intricately branched, finely glandular-viscid; leaves linear-elliptic or narrowly oblanceolate, 2.5 cm. long or less, 3.5 mm. wide or less, acute, 1-nerved, impressed-punctate, spinulose-ciliolate, deciduous, the upper ones reduced to minute bracts; heads pedicellate, solitary at tips of branchlets, about 4 mm. high; involucre 2 or 3-seriate, graduate, the oblong obtuse glandular-granular thin-margined phyllaries greenish above, arranged in distinct vertical ranks; rays about 3, fertile, white, "changing to rose-purple," the lamina 3 mm. long; disk flowers about 6, white, "changing to rose-purple;" achenes oblong-turbinate, 10-striate, densely pubescent; pappus of the ray achenes of about 15 lanceolate squamellae 0.5 mm. long, that of the disk achenes of about 30 linear-lanceolate acuminate paleaceous awns about 1.3 mm. long.

27. **ASTER** L. Sp. Pl. 872. 1753.

Herbaceous, rarely suffrutescent or shrubby; leaves alternate, usually entire or slightly toothed; heads small to large, solitary to paniced, radiate or rarely discoid, the rays white to violet, never yellow, the disk whitish or yellow, often changing to purplish; involucre usually distinctly graduate, the phyllaries usually narrow and herbaceous-tipped; style branches acute or acuminate; pappus of numerous slender subequal bristles.

Plants glabrous throughout, glaucous or glaucescent.

Plant unarmed; heads discoid..... 5. **A. carnosus**.

Plant spine-bearing; heads radiate..... 6. **A. spinosus**.

Plants pubescent or glandular, at least on the involucre, not glaucous or glaucescent.

Leaves subulate to spatulate, entire, 1 cm. long or less; plants 15 cm. high or less, many-stemmed..... 8. **A. leucelene**.

Leaves linear to lanceolate or rhombic, much more than 1 cm. long, or else plants much more than 15 cm. high.

Leaves rhombic or cuneate, spiny-toothed, strongly reticulate.

7. **A. frutescens**.

Leaves linear to lanceolate, not spiny-toothed or reticulate.

Plant finely granular-glandular, not pubescent; branches sharply angled.

4. **A. palmeri**.

Plant strigose, hirsute, or hirsutulous, at least in lines; branches not angled.

Involucre about 5-seriate; leaves thick, the middle and upper chiefly subulate or linear, 2 cm. long or less.....1. *A. lima*.

Involucre about 3-seriate; leaves thin, the middle ones lanceolate or linear-lanceolate, 3 to 9.5 cm. long.

Leaves 3 to 5 cm. long; involucre 5 mm. high-----2. *A. jalapensis*.

Leaves 5 to 9.5 cm. long; involucre 6 to 7 mm. high-3. *A. bullatus*.

1. *Aster lima* Lindl. in DC. Prodr. 5: 230. 1836.

?*Aster moranensis* H. B. K. Nov. Gen. & Sp. 4: 93. 1820.

Aster lindenii Schultz Bip. in Seem. Bot. Voy. Herald 302. 1856.

Aster ehrenbergii Schultz Bip. in Seem. Bot. Voy. Herald 302. 1856.

?*Aster purpurascens* Schultz Bip. in Seem. Bot. Voy. Herald 303. 1856.

San Luis Potosí to Chiapas; type from Mexico, without definite locality.

Slender, herbaceous or suffrutescent below, up to 60 cm. high, the stem strigose or sometimes hirsute; lower leaves linear to lanceolate, about 3 cm. long, 3 to 7 mm. wide, entire, usually deciduous, the upper linear to subulate or lance-subulate, often reduced to awl-shaped bracts on the peduncles, rough-margined; heads solitary at tips of stem and branches, 1.5 to 2.5 cm. wide; involucre 5 to 8 mm. high, strongly graduate, the phyllaries linear or linear-lanceolate, with conspicuous rhombic green tips, whitish and indurate below, somewhat pubescent; rays "white."

2. *Aster jalapensis* Fernald, Proc. Amer. Acad. 35: 572. 1900.

Veracruz; type from Barranca de Chavarrillo.

Herbaceous or suffrutescent, decumbent at base, about 25 cm. high, hirsute in lines; leaves narrowly lanceolate or oblanceolate, 3 to 10 mm. wide, narrowed into a petioliform base, few-serrulate, hirsute-ciliate toward base; heads few, about 1 cm. wide; involucre graduate, the linear obtusish phyllaries slightly ciliate, appressed; rays white.

3. *Aster bullatus* Klatt, Ann. Naturhist. Hofmus. Wien 9: 359. 1894.

Mexico; type from "Inquila." Guatemala.

Herbaceous or suffrutescent, decumbent at base, about 35 cm. high, hirsutulous above in lines; leaves lanceolate or linear-lanceolate, 5 to 8 mm. wide, narrowed to a petioliform, hirsute-ciliate base, sharply serrulate above; heads paniced, about 1.5 cm. wide.

4. *Aster palmeri* A. Gray, Proc. Amer. Acad. 17: 209. 1882.

Tamaulipas and San Luis Potosí. Texas; type from Corpus Christi Bay.

Frutescent, up to 1.3 meters high, somewhat viscid, much branched; leaves linear, 2 cm. long or less, 1.5 mm. wide or less, thick, 1-nerved, entire; heads solitary at tips of bracteate peduncles, turbinate, 7 to 11 mm. wide; involucre about 5-seriate, graduate, the oblong, obtuse or acutish phyllaries indurate, appressed, with scarios lacerate margins and obscurely greenish, granular-viscid apex; rays 8 to 10, short, white. Plant with the aspect of a *Baccharis*.

5. *Aster carnosus* A. Gray, Syn. Fl. 1²: 202. 1884.

Linosyris ? *carnosus* A. Gray, Pl. Wright. 2: 80. 1853.

Bigelovia intricata A. Gray, Proc. Amer. Acad. 17: 208. 1882.

Leucosyris carnosus Greene, Fl. Franc. 384. 1897.

California and Nevada to Arizona; type from west of the Chiricahua Mountains, Arizona. Apparently not yet collected within the limits of Mexico.

Rigidly much branched, frutescent, 1 meter high or less, pale and glaucescent; leaves linear, fleshy, mostly 1 cm. long or less, nerveless, the upper reduced to scales; involucre 5 to 7 mm. high, graduate, the linear, cuspidate-acute or acuminate phyllaries appressed, without herbaceous tips.

6. *Aster spinosus* Benth. Pl. Hartw. 20. 1839.*Leucosyris spinosa* Greene, *Pittonia* 3: 244. 1897.*Aster spinosus spinosissimus* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 375. 1917.

Baja California and northern Mexico to Oaxaca; type from Aguascalientes. Texas to Arizona and California; Guatemala, Costa Rica.

Woody below, up to 2.5 meters high, much branched; stem and branches striate-angled, usually bearing stout, subterete or flattened, axillary or supra-axillary spines up to 5 cm. long; leaves subulate to linear, 4 cm. long or usually much less, deciduous; heads 1 to 1.5 cm. wide, solitary at tips of branchlets; involucre 3 to 5 mm. high, of lanceolate narrowly thin-margined phyllaries; rays white; achenes glabrous.

7. *Aster frutescens* S. Wats. Proc. Amer. Acad. 24: 55. 1889.

Central western Baja California and adjacent islands; type from Los Angeles Bay.

Shrub about 90 cm. high, white-barked; young parts hirtellous-glandular; leaves sessile, 1.5 to 2.5 cm. long, 5 to 12 mm. wide, repandly spiny-toothed, sessile; heads 1.5 to 2 cm. wide, solitary at tips of branchlets; involucre 7 to 10 mm. high, graduate, of lanceolate glandular phyllaries with attenuate greenish tips; rays lilac.

8. *Aster leucelene* Blake in Tidestrom, Contr. U. S. Nat. Herb. 25: 562. 1925.*Inula ericoides* Torr. Ann. Lye. N. Y. 2: 212. 1828. Not *Aster ericoides* L. 1753.*Aster ericaefolius* Rothr. Bot. Gaz. 2: 70. 1877. Not *A. ericaefolius* Forsk. 1775.*Aster ericaefolius tenuis* A. Gray, Syn. Fl. 1²: 198. 1884.*Leucelene ericoides* Greene, *Pittonia* 3: 148. 1896.

Chihuahua to San Luis Potosí. Kansas to Texas and Utah; type collected "on the Canadian"?

Slender, many-stemmed, suffruticulose, the stem strigose; lowest leaves usually spatulate, strigose and often hirtellous-ciliate, the upper subulate to linear, 2 to 10 mm. long; heads about 1.5 cm. wide; involucre 5 to 7 mm. high, graduate, the appressed, linear or linear-lanceolate phyllaries acute, scarious-margined, strigose to subglabrous; rays white, often turning purplish red.

28. ERIGERON L. Sp. Pl. 863. 1753.Characters of *Aster*, but involucre obscurely or not at all graduate, rays usually more numerous and narrow, and style branches with short obtuse tips.

The English names "fleabane" and "daisy" are frequently applied to the species of this genus occurring in the United States.

Rays 1 to 1.5 mm. long; involucre 2 to 3 mm. high.-----1. *E. socorrensis*.

Rays 3 to 6 mm. long; involucre 3 to 5 mm. high.

Involucre finely glandular-puberulous, otherwise essentially glabrous.

2. *E. exilis*.

Involucre sparsely or densely strigose or hirsute, sometimes also glandular-puberulous.

Stem and peduncles pubescent with spreading or reflexed hairs.

3. *E. calcicola*.

Stem and peduncles strigose or pubescent with ascending hairs.

Involucre more or less densely glandular-puberulous as well as hirsute.

4. *E. ervendbergii*.Involucre sparsely or densely strigose or strigillose, not glandular-puberulous.-----5. *E. karvinskianus*.

1. *Erigeron socorrensis* T. S. Brandeg. *Erythea* 7: 4. 1899.

Socorro and San Benedicto Islands, Baja California; type from Socorro Island.

Frutescent, hirsutulous; leaves crowded, linear-oblongate to obovate, 2.5 to 7 cm. long, 3 to 15 mm. wide, entire, crenate, serrate, or few-lobed, thickish, narrowed into a petioliform base; heads tiny, white, in terminal panicles; involucre hirsutulous, slightly graduate.

2. *Erigeron exilis* A. Gray in S. Wats. Proc. Amer. Acad. 22: 422. 1887.

Jalisco; type from Río Blanco.

Suffruticulose, slender, about 25 cm. high, granular-puberulous, at least above, and somewhat hirsute or strigillose; leaves linear-oblongate, 1 to 2.5 cm. long, 1 to 2.5 mm. wide, acute, entire; heads white, 1.5 cm. wide, solitary at tips of branchlets; phyllaries somewhat graduate, linear-lanceolate, acuminate, the inner usually purplish above and subscariosus.

3. *Erigeron calcicola* Greenm. Proc. Amer. Acad. 41: 256. 1905.

Coahuila to Hidalgo; type from Tula, Hidalgo.

Suffruticulose, 15 to 30 cm. high; leaves oblongate to spatulate-linear, 2.5 cm. long or less, 1 to 5 mm. wide, entire or the lower few-toothed; heads long-pedunculate, 1.5 to 2 cm. wide; phyllaries hirsutulous; rays white or purple-tinged; pappus double.

4. *Erigeron ervendbergii* A. Gray, Proc. Amer. Acad. 8: 650. 1873.

San Luis Potosí to Puebla and Veracruz; type from Wartenberg, Veracruz.

Suffruticulose, decumbent at base, with several slender stems, about 30 cm. high; leaves linear to oblongate, usually 2.5 cm. long or less, the lower sometimes 6 cm. long, coarsely few-toothed, narrowed into a slender petiole; heads long-peduncled, 2 cm. wide; involucre subequal; rays purplish-tinged; pappus double.

5. *Erigeron karvinskianus* DC. Prodr. 5: 285. 1836.

Erigeron mucronatus DC. Prodr. 5: 285. 1836.

Erigeron trilobus Sonder, Hamb. Gart. Zeit. 12: 78. 1856, excluding synonym.

Erigeron karvinskianus mucronatus Hieron. Bot. Jahrb. Engler 28: 585. 1901.

Vittadinia triloba Auct., not DC.

San Luis Potosí to Chiapas. Guatemala; South America.

Suffruticulose, slender, decumbent, 60 cm. long or less; lower leaves usually cuneate or obovate, few-toothed or lobed, 3 cm. long or less, mucronate, the upper or sometimes all linear-lanceolate, entire; heads long-peduncled, 2 cm. wide; involucre subequal, the linear acuminate phyllaries usually sparsely strigose; rays white or purplish-tinged; pappus double.

DOUBTFUL SPECIES.

ERIGERON DIPLOPAPPOIDES Schauer, *Linnaea* 19: 722. 1847.

29. *BACCHARIS* L. Sp. Pl. 860. 1753.

Shrubs, rarely only suffrutescent, dioecious; leaves alternate, entire or toothed; heads small or medium, discoid, whitish, cymose or paniced, rarely subsolitary; involucre graduate, the phyllaries dry, sometimes with green midrib, narrowly scarious-margined; receptacle naked, very rarely paleaceous; pistillate heads with tubular-filiform corollas; staminate heads with the flowers hermaphrodite but sterile, with tubular 5-toothed corollas; achenes small, 5 to 10-nerved; pistillate pappus of soft capillary bristles, 1 to several-seriate, persistent; staminate pappus stiffer, the bristles often somewhat dilated above.—The descriptions of achenes and pappus in the following treatment refer only to the pistillate heads.

The name "chamicillo" is reported for a Mexican species of uncertain specific position. *Baccharis coridifolia* DC. of South America is notorious as being poisonous to sheep and cattle. An alkaloid, baccharine, has been separated from it. *B. halimifolia* L., of the United States, is used in domestic medicine as a remedy for affections of the respiratory system, like some of the Mexican species.

Leaves closely serrulate or serrate (teeth 5 to 10 per cm.).

Heads in long spikelike or raceme-like panicles on the branches.

3. *B. ramulosa*.

Heads in rounded terminal cymose panicles.

Stem and branches glabrous or merely glandular-granular.

Leaves linear to narrowly oblanceolate or linear-oblanceolate.

22. *B. thesioides*.

Leaves lanceolate (distinctly broadest near the base) to cuneate-oblong or oval.

Leaves lanceolate, acuminate; pistillate heads tiny, about 3 mm. high.

21. *B. alamosana*.

Leaves cuneate-oblong or cuneate to oval.

Leaves regularly oval or oblong-oval, finely toothed. . . 19. *B. elegans*.

Leaves cuneate or cuneate-oblong, rather coarsely toothed.

20. *B. bigelovii*.

Stem and branches sordid-pubescent or sordid-puberulous.

Phyllaries (of both staminate and pistillate heads) with green, densely and sordidly glandular-puberulous midline and densely arachnoid-ciliate margin. 23. *B. sordescens*.

Phyllaries not densely arachnoid-ciliate, often subglabrous.

Phyllaries rather densely ciliate, often purplish; staminate heads 4 to 6 mm. high; pistillate heads in fruit 7 to 10 mm. high.

24. *B. multiflora*.

Phyllaries obscurely ciliate, not purplish; staminate heads 3 to 4 mm.

high; pistillate heads in fruit 5 to 6 mm. high. . . 25. *B. serraefolia*.

Leaves entire to serrate, the teeth remote (1 to 3 per cm.).

Leaves linear-lanceolate or lanceolate to elliptic-ovate, triplinerved, 5 to 10 cm. long.

Heads few (about 3), long-peduncled. 17. *B. squarrosa*.

Heads numerous, paniced or cymose.

Leaves elliptic, oblong-elliptic, or oval, entire, strongly triplinerved; branches usually sordid-pubescent or puberulous. . . 27. *B. trinervis*.

Leaves lanceolate, linear-lanceolate, or narrowly oblanceolate, nearly always toothed; branches glabrous or merely glandular-granular.

Leaves chiefly oblanceolate, not acuminate, irregularly few-toothed above; pappus at maturity about 1 cm. long. 4. *B. neglecta*.

Leaves lanceolate or linear-lanceolate, acuminate, usually regularly serrate or serrulate; pappus at maturity about 4 mm. long.

26. *B. glutinosa*.

Leaves linear to cuneate, oblanceolate, or obovate, usually 1-nerved and less than 5 cm. long, sometimes longer.

Leaves cuneate to broadly oblanceolate or obovate, less than five times as long as wide.

Heads large, 8 to 12 mm. high, solitary at tips of short, very leafy branches, these often arranged in long virgate racemes.

Larger leaves cuneate-oblanceolate, sharply serrate or serrulate.

3. *B. ramulosa*.

Larger leaves oblanceolate, entire. 13. *B. macrocephala*

- Heads (at least the staminate) smaller, several to many, glomerulate or paniced, rarely solitary at tips of branchlets, these arranged in virgate racemes on the branches.
- Heads solitary at tips of short branchlets, these arranged in virgate racemes on the branches.-----3. *B. ramulosa*.
- Heads otherwise.
- Heads paniced, very numerous, usually not overtopped by the leaves.
- Pappus about 1 cm. long; receptacle naked-----5. *B. emoryi*.
- Pappus about 3 mm. long; pistillate receptacle paleaceous.
11. *B. sergiloides*.
- Heads glomerulate at tips of branches or on short subterminal axillary peduncles, usually overtopped by the leaves; pappus in fruit 6 mm. long or less.
- Leaves broadly cuneate or rhombic, 3 to 5-toothed, rarely entire, 2 cm. long or less-----7. *B. conferta*.
- Leaves elliptic, oval, obovate, or oblanceolate, the larger usually more than 2 cm. long.
- Leaves oblanceolate to cuneate-obovate, toothed or entire.
8. *B. heterophylla*.
- Leaves elliptic or oval, entire.
- Leaves 1.5 to 2.5 cm. long; lateral veins obsolete.
9. *B. vaccinioides*.
- Leaves 3 to 6 cm. long; lateral veins finely prominulous beneath.
10. *B. lancifolia*.
- Leaves linear to narrowly oblanceolate, more than five times as long as wide.
- Heads solitary at tips of densely foliose or bracteate branchlets, these sometimes paniculately arranged.
- Larger leaves sharply toothed-----3. *B. ramulosa*.
- Larger leaves entire.
- Floriferous branchlets covered with linear-oblanceolate or linear-spatulate leaves 1 mm. wide or less; staminate heads 3 to 5 mm. thick-----12. *B. ramiflora*.
- Floriferous branchlets densely crowded with elliptic or oblanceolate leaves 2 to 4 mm. wide; staminate heads 8 to 10 mm. thick.
13. *B. macrocephala*.
- Heads usually paniculate or cymose, if solitary at tips of branches then on nearly or quite naked peduncles.
- Heads very numerous, in often elongate leafy panicles; pappus in fruit about 1 cm. long; leaves linear-oblanceolate to cuneate-oblanceolate, usually coarsely toothed.
- Main stem leaves linear-oblanceolate or narrowly oblanceolate, mostly 1-nerved-----4. *B. neglecta*.
- Main stem leaves cuneate-oblanceolate or oblong-oblanceolate, mostly triplinerved-----5. *B. emoryi*.
- Heads solitary at tips of nearly naked branchlets or few and long-peduncled, or in nearly naked cymes or panicles.
- Heads 1 to 3, long-peduncled at tip of the subsimple stems.
17. *B. squarrosa*.
- Heads several to very many; stems usually much branched.
- Plants finely and densely hirtellous or puberulous.
18. *B. brachyphylla*.

Plants glabrous or glandular-granular.

Stems broomlike, at flowering time usually essentially naked or with minute scale-like leaves; plants fastigiate-ly much branched.

Pappus in fruit about 12 mm. long-----6. *B. sarothroides*.

Pappus in fruit 3 mm. long-----11. *B. sergiloides*.

Stems not broomlike, normally leafy; plants rarely fastigiate-branched.

Heads mostly in clusters of 3 to 5 at tips of branches, short-pediceled; leaves chiefly oblanceolate or elliptic-oblong, entire, the larger about 2.5 cm. long, 7 mm. wide.

14. *B. palmeri*.

Heads solitary at tips of branches or cymose-panicled; leaves chiefly linear or very narrowly linear-oblanceolate.

Heads several or numerous, loosely or rarely rather densely cymose-panicled; pappus 4 to 8 mm. long.

Pistillate heads 6 to 7 mm. high, their pedicels 2.3 cm. long or less; pappus 4 mm. long; plant suffrutescent.

15. *B. potosina*.

Pistillate heads 9 to 10 mm. high, their pedicels 1.5 to 7 cm. long; pappus 7 mm. long; plants herbaceous nearly throughout-----16. *B. occidentalis*.

Heads solitary at tips of the numerous branches; stems usually less than 60 cm. high; pappus 10 to 15 mm. long.

Stems much branched throughout, the leaves scattered, the lower oblanceolate, the upper reduced.

1. *B. wrightii*.

Stems simple or subsimple at least below, densely leafy throughout, the leaves linear or linear-oblanceolate.

2. *B. texana*.

1. *Baccharis wrightii* A. Gray, Pl. Wright. 1: 101. 1852.

Baccharis wrightii pyrhopappa A. Gray, Pl. Wright. 2: 84. 1853.

Chihuahua and Durango. Kansas to Texas and Arizona; type from Valley of the Limpio, western Texas.

Herbaceous from a suffrutescent base, 50 cm. high or less, glabrous, pale green, the stems striate, much branched, sparsely leafy above; lower leaves oblanceolate, entire, 2 cm. long or less, the upper chiefly linear-subulate; involucre 7 to 12 mm. high, the phyllaries with conspicuous greenish center, acute or acuminate; achenes 8 to 10-nerved, glandular-seabridulous; pappus rufescent, 1 cm. long or more.

2. *Baccharis texana* (Torr. & Gray) A. Gray, Mem. Amer. Acad. n. ser. 4: 75. 1849.

Linosyris texana Torr. & Gray, Fl. N. Amer. 2: 232. 1842.

Tamaulipas. Texas; type from Texas.

Stems several, mostly herbaceous from a suffrutescent base, nearly simple, leafy throughout; leaves linear to narrowly linear-oblanceolate, the larger 2 to 4.8 cm. long, 1 to 3 mm. wide, 1-nerved, wavy-margined; involucre 4 to 8 mm. long, the phyllaries with greenish midline; achenes about 8-nerved, glandular-seabridulous; pappus rufescent, 1 cm. long or more.

3. *Baccharis ramulosa* (DC.) A. Gray, Mem. Amer. Acad. n. ser. 5: 301. 1854.

Aplopappus ramulosus DC. Prodr. 5: 350. 1836.

Baccharis pteronioides DC. Prodr. 5: 410. 1836.

Linosyris ramulosa A. Gray, Pl. Wright. 2: 80. 1853.

Baccharis fasciculata Klatt, Leopoldina 20: 91. 1884, nomen nudum.

Chihuahua and Tamaulipas to Puebla; type from Tlapuajahua. New Mexico and Arizona.

Diffusely branched, low shrub, glandular-roughened, white-barked; larger leaves cuneate-oblongate, about 1.5 cm. long, 3 to 5 mm. wide, sharply serrulate or serrate-dentate, chiefly deciduous at flowering time, those of the branches fasciated, linear or linear-oblongate, mostly entire and 5 mm. long or less; involucre 3 to 6 mm. high, the phyllaries with greenish midline; achenes about 8-nerved, glandular-scabridulous; pappus somewhat straw-colored, 8 to 10 mm. long. "Hierba del pasmo" (Coahuila); "popotillo" (Nayarit); "boshi" (Otomí, Urbina); "jaral blanco," "tepopote" (Jalisco); "tepopotl" (Nahuatl).

In Coahuila the dried and powdered plant is employed as a dressing for sores.

4. *Baccharis neglecta* Britton in Britt. & Brown, Illustr. Fl. 3: 394. f. 3835. 1898.

Baccharis angustifolia A. Gray, Journ. Bost. Soc. Nat. Hist. 6: 224. 1850.

Not *B. angustifolia* Michx. 1803.

Chihuahua to Coahuila and Durango. Nebraska to Texas.

Shrubby, about 1 meter high, glandular-glutinous, with numerous erect or ascending, striate, leafy branches; leaves linear to oblongate, the larger 4 to 8 cm. long, 3 to 8 mm. wide, coarsely few-toothed or entire, weakly triplinerved; heads very numerous, in usually broad leafy panicles; involucre 3 to 4 mm. high; achenes about 8-nerved, glabrous; pappus brownish-tinged, 1 cm. long. "Jarilla común," "jarilla del río" (Durango).

5. *Baccharis emoryi* A. Gray in Torr. U. S. & Mex. Bound. Bot. 83. 1850.

Northern Mexico (according to Hemsley). Utah to California and Arizona; type from the Gila River, Arizona.

Glutinous shrub, up to 4.5 meters high; leaves oblongate or oblong-elliptic, 2 to 6.5 cm. long, 3 to 18 mm. wide, coarsely few-toothed or entire, triplinerved; involucre 4 to 8 mm. long; achenes glabrous, about 8-nerved; pappus brownish white, about 1 cm. long.

6. *Baccharis sarothroides* A. Gray, Proc. Amer. Acad. 17: 211. 1882.

Sonora, Sinaloa, and Baja California and its islands. California; type from San Diego County.

Glutinous shrub, up to 4.5 meters high, with densely fastigate, striate-angled branchlets; larger leaves linear, 2 cm. long or less, entire, deciduous, those of the branchlets minute, scale-like; involucre 2 (staminate) to 8 mm. high; achenes glabrous, about 8-nerved; pappus brownish-tinged, about 1 cm. long. "Hierba del pasmo" (Baja California).

The twigs are chewed as a remedy for toothache (*Palmer*).

7. *Baccharis conferta* H. B. K. Nov. Gen. & Sp. 4: 55. 1820.

Baccharis zalapensis H. B. K. Nov. Gen. & Sp. 4: 56. 1820.

Baccharis philippensis Less. in Schlecht. & Cham. Linnaea 5: 147. 1830. Not

B. philipensis H. B. K. 1820.

Baccharis cuneata DC. Prodr. 5: 408. 1836.

?*Baccharis orizabaensis* Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 130.

1881, nomen nudum.

San Luis Potosí to Puebla and Veraacruz; type from Cuernavaca, Morelos.

Much-branched glutinous shrub, up to 2 meters high, very leafy; leaves cuneate or rhombic-cuneate, 1 to 2 cm. long, 4 to 15 mm. wide, usually 3 or 5-dentate, rarely entire, 1-nerved; heads sessile in close clusters 1 to 2.5 cm. wide at tips of branches; involucre 3 mm. high; achenes glabrous, about 10-nerved, the brownish-tinged pappus about 5 mm. long. "Escobilla" (Morelos); "tepopote" (Urbina); "escoba del monte" (Veracruz); "hierba del carbonero" (Valley of Mexico).

8. *Baccharis heterophylla* H. B. K. Nov. Gen. & Sp. 4: 62. 1820.

San Luis Potosí and Tepic to Oaxaca and Yucatán; type from Guanajuato, Guatemala.

Much-branched glutinous shrub, 0.6 to 2.5 meters high, densely leafy; leaves oblanceolate or elliptic-oblanceolate to cuneate-obovate, mostly 2 to 5.5 cm. long, 3 to 20 mm. wide, few-toothed or sometimes entire, 1-nerved or faintly triplinerved; other characters as in *B. conferta*. "Jara" (Langlassé); "escobilla" (Valley of Mexico).

9. *Baccharis vaccinioides* H. B. K. Nov. Gen. & Sp. 4: 50. 1820.

Southern Mexico; type from Morán. Guatemala.

Similar to *B. heterophylla*; leaves elliptic or oval, 1 to 2.5 cm. long, 6 to 10 mm. wide, acute, entire or "rarely 1-toothed on each side," 1-nerved.

10. *Baccharis lancifolia* Schlecht. Linnaea 9: 266. 1834.

Veracruz and Puebla; type from Jalapa, Veracruz.

Similar to *B. vaccinioides*; leaves elliptic, 3.5 to 6 cm. long, 1 to 2 cm. wide, 1-nerved. "Mesté" (Chiapas, Seler).

11. *Baccharis sergiloides* A. Gray in Torr. U. S. & Mex. Bound. Bot. 83. 1859.

Sonora. California and Nevada to Arizona; type from the Gila or Colorado River, Arizona.

Suffrutescent, glutinous, up to 1.6 meters high, the very numerous erect branches strongly striate-angled; larger leaves cuneate or cuneate-obovate, about 2.5 cm. long, 3 to 8 mm. wide, entire, somewhat venose, mostly deciduous, those of the branchlets mostly linear or scale-like; heads very numerous, naked-paniculate; achenes glabrous, 10-nerved; pappus about 3 mm. long; receptacle paleaceous, at least in the pistillate heads.

12. *Baccharis ramiflora* A. Gray, Proc. Amer. Acad. 15: 33. 1879.

Baccharis ramiflora squarralosa A. Gray, Proc. Amer. Acad. 15: 33. 1879.

San Luis Potosí.

Glutinous shrub, 1 meter high or less; stem leaves oblanceolate or linear-oblanceolate, 1.8 to 7.5 cm. long (including the petioliform base), 2 to 5 mm. wide, entire, obscurely triplinerved, those of the branchlets chiefly narrowly linear-spatulate, crowded; branchlets 1-headed, sometimes racemously arranged on the branches; involucre 3 to 6 mm. high, the phyllaries obtuse or acutish; achenes 8-nerved, obscurely glandular-scabridulous; pappus brownish-tinged, 5 mm. long.

13. *Baccharis macrocephala* Schultz Bip.; Greenm. Proc. Amer. Acad. 35: 575. 1899.

Distrito Federal to Veracruz; type from Veracruz.

Glutinous shrub, about 60 cm. high; stem leaves oblanceolate or elliptic, 2 to 3 cm. long, 3 to 6 mm. wide, with usually reflexed apex, 1-nerved, entire, deciduous, those of the flowering branchlets smaller, densely crowded; branchlets monocephalous, virgately arranged; heads subglobose, 9 to 14 mm. high, 10 to 17 mm. thick; achenes 8-nerved, somewhat glandular; pappus 1 cm. long, slightly exceeding the styles.

14. *Baccharis palmeri* Greenm. Proc. Amer. Acad. 41: 259. 1905.

Known only from the type locality, vicinity of Durango, Durango.

Suffruticose, 20 to 30 cm. high, several-stemmed, glandular-viscid, very leafy; larger leaves oblanceolate or oblong-elliptic, 1.5 to 2.8 cm. long, 3 to 8 mm. wide, 1-nerved or weakly triplinerved, entire; heads in clusters of 3 to 5 at tips of branchlets, short-pedicelcd or sessile; involucre about 3-seriate, 6 to 7 mm. long, the phyllaries acute; achenes essentially glabrous, about 8-nerved; pappus 12 mm. long.

15. *Baccharis potosina* A. Gray, Proc. Amer. Acad. 15: 33. 1879.

Coahuila and San Luis Potosí; type from San Luis Potosí.

Suffrutescent, glutinous, much branched, 50 cm. high or more, the slender erect branches striate; leaves linear to narrowly linear-oblong or linear-lanceolate, 2 to 4.5 cm. long, 1 to 3 mm. wide, 1-nerved, acute or acuminate, entire or sometimes with a few small acute teeth above; heads from solitary at tips of the numerous branches to loosely cymose-panicled or rather closely panicled, always rather numerous, 3 to 7 mm. high; achenes 5-nerved, glabrous; pappus 4 mm. long.

16. *Baccharis occidentalis* Blake, Contr. U. S. Nat. Herb. 22: 595. 1924.

Tepic and Jalisco; type from Guadalajara, Jalisco.

Stems numerous, 60 to 80 cm. high, slender, junciform, glabrous, striate, not distinctly viscid, herbaceous almost throughout; leaves chiefly below the middle of stem, linear to very narrowly linear-lanceolate or oblanceolate, 2.5 to 5 cm. long, 1.5 to 4 mm. wide, entire or with a few slender acute teeth above, weakly triplinerved; achenes glandular, 5-nerved; pappus about 7 mm. long.

17. *Baccharis squarrosa* H. B. K. Nov. Gen. & Sp. 4: 67. 1820.

Baccharis seemanni A. Gray, Proc. Amer. Acad. 15: 33. 1879.

Sierra Madre of northwestern Mexico, Guanajuato, and San Luis Potosí; type collected near Guanajuato.

Stems subsimple, about 40 cm. high, striate, somewhat glutinous, herbaceous nearly to base; leaves linear-lanceolate or linear, 2 to 5.5 cm. long, 2 to 4 mm. wide, entire, weakly triplinerved; heads 1 to 4, 1 to 1.2 cm. high, long-peduncled; involucre 7 to 9 mm. high, the phyllaries with broad green midline; achenes glandular, 5-ribbed; pappus (immature) 7 mm. long, scarcely exceeding the styles.

18. *Baccharis brachyphylla* A. Gray, Pl. Wright. 2: 83. 1853.

Sonora. California and Arizona; type collected between Conde's Camp and the Chiricahua Mountains, Arizona.

Suffrutescent, 1 meter high or less, much branched, densely and finely puberulous; leaves linear or oblong-linear, entire, 1.5 cm. long or less; heads numerous, in rather open panicles; involucre 3 to 6 mm. high; achenes 5-nerved, glandular-pilosulous; pappus about 7 mm. long.

19. *Baccharis elegans* H. B. K. Nov. Gen. & Sp. 4: 60. *pl. 324*. 1820.

Baccharis oligantha Schultz Bip.; Klatt, Leopoldina 20: 91. 1884, as synonym.

Puebla and Oaxaca; type locality unknown.

Glutinous shrub 1 meter high or less; leaves oval or oblong, 1.3 to 3 cm. long, 6 to 18 mm. wide, short-petioled, closely sharp-serrate or serrulate, veiny, barely triplinerved; panicles rounded, many-headed; involucre 2.5 to 5 mm. high; achenes 5-nerved, essentially glabrous; pappus 5 mm. long.

20. *Baccharis bigelovii* A. Gray in Torr. U. S. & Mex. Bound. Bot. 84. 1859.

Sonora to Coahuila; type from Puerto de Paysano, Sonora. Texas and New Mexico.

Similar to *B. elegans*; leaves cuncate or cuncate-oblong to oblong-oblong, 1.5 to 3.5 cm. long, 4 to 15 mm. wide, 1-nerved or obscurely triplinerved, not venose, rather coarsely toothed.

21. *Baccharis alamosana* Blake, Contr. U. S. Nat. Herb. 22: 595. 1924.

Known only from the type locality, Sierra de Alamos, Sonora.

Frutescent, somewhat glutinous, slender, 40 cm. high and more; leaves lanceolate, 1.8 to 3.5 cm. long, 4 to 9 mm. wide, petioled, finely serrulate, acuminate; pistillate heads tiny, in small cymose panicles; involucre about 2.5 mm. high; achenes 5-angled, glabrous; pappus 2.5 mm. long.

22. *Baccharis thesioides* H. B. K. Nov. Gen. & Sp. 4: 61. 1820.*Baccharis plarmicaefolia* DC. Prodr. 5: 419. 1836.*Baccharis sulcata* DC. Prodr. 5: 419. 1836.

Sonora to Jalisco and Mexico; type from Santa Rosa (Guanajuato?). Arizona and New Mexico.

Shrubby, scarcely glutinous, 2 meters high or less; leaves linear to narrowly oblanceolate, 2 to 8.5 cm. long, 1.5 to 8 mm. wide, usually acute, closely sharp-serrulate, 1-nerved or weakly triplinerved; heads 4 to 6 mm. high, numerous in rounded panicles; achenes 5-nerved, glabrous or glandular; pappus about 3.5 mm. long.

23. *Baccharis sordescens* DC. Prodr. 5: 405. 1836.

San Luis Potosí to Oaxaca; type from Mexico, without definite locality.

Shrub, up to 3 meters high, densely sordid-tomentulose or puberulous; leaves oblong, elliptic-oblong, or elliptic, 1.5 to 5.5 cm. long, 5 to 18 mm. wide, closely sharp-serrulate, triplinerved, usually obtuse; panicles rounded, many-headed; involucre 4 to 7 mm. high, strongly graduate, the obtuse green-centered phyllaries densely arachnoid-pilose-ciliate, more or less glandular and tomentulose; achenes 5-nerved, subglabrous; pappus whitish, 6 mm. long.

24. *Baccharis multiflora* H. B. K. Nov. Gen. & Sp. 4: 59. 1820.

State of Mexico to Chiapas; type from Tianguillo and Toluca, State of Mexico.

Shrub, up to 3 meters high, rufescent or sordid-tomentulose at least on the younger parts; leaves elliptic to obovate, 2 to 9 cm. long, 0.8 to 3 cm. wide, closely sharp-serrulate, scarcely triplinerved; panicles rounded; achenes and pappus as in *B. sordescens*. "Hierba del carbonero," "hierbabuena del carbonero," "escobilla," "tepopote," "tepopotl," "limpia-tuna" (Valley of Mexico).

An infusion of the leaves is much used in the Valley of Mexico as a remedy for nasal catarrh.

25. *Baccharis serraefolia* DC. Prodr. 5: 403. 1836.*?Baccharis parviflora* Less. in Schlecht. & Cham. Linnæa 5: 146. 1830.

Durango to Veraacruz; type from Santa Rosa and Los Ioares, Guanajuato. Guatemala.

Similar to *B. multiflora*; heads smaller; phyllaries obscurely ciliate; pappus 4 mm. long.

26. *Baccharis glutinosa* Pers. Syn. Pl. 2: 425. 1807.*Molina viscosa* Ruiz & Pav. Syst. Veg. Peruv. Chil. 207. 1798. Not *Baccharis viscosa* Lam. 1783.*Baccharis farinosa* Spreng. in Ersch & Gruber, Allg. Encycl. 7: 27. 1821.*Baccharis coerulescens* DC. Prodr. 5: 402. 1836.*Baccharis alamani* DC. Prodr. 5: 402. 1836.*Baccharis longifolia* DC. Prodr. 5: 402. 1836.

Sonora to Tamaulipas, south to Oaxaca; Baja California. California to Colorado and Texas; central and western South America; type from South America.

Woody below, glutinous, up to 4 meters high, very leafy; leaves linear to lanceolate, 5 to 12 cm. long, 4 to 18 mm. wide, acuminate at each end, usually remotely but regularly serrate or serratulate, sometimes entire, somewhat triplinerved; panicles terminal, rounded, many-headed; involucre stramineous, 3 to 5 mm. high; achenes 5-angled; pappus whitish, about 4 mm. long. "Jarilla" (Sinaloa, Chihuahua); "jara" (Guanajuato, Texas); "hierba del carbonero" (Valley of Mexico); "jaral" (Tamaulipas, Guanajuato); "jarilla común," "jarilla del río" (Durango); "jara dulce" (Texas); "chilca," "sauce" (El Salvador).

This species is a common shrub along river valleys in the drier parts of Mexico, often forming dense and extensive thickets. The branches are employed for covering the rafters of houses before the tiles or thatch are placed upon them. A decoction of the leaves is used as an eye wash, and the leaves are applied as poultices to sores. The branches are often utilized for making coarse brooms.

27. *Baccharis trinervis* (Lam.) Pers. Syn. Pl. 2: 423. 1807.

?*Conyza trinervia* Mill. Gard. Diet. ed. 8. *Conyza* no. 12. 1768.

Baccharis trinervis Lam. Encycl. 2: 85. 1786.

Veracruz. Central and South America; type from Brazil.

Shrubby, about 4 meters high, subscandent, the stem striate-angled, glabrous; leaves elliptic or oblong-elliptic to lance-elliptic or ovate-elliptic, the larger 5 to 9.5 cm. long, 1.5 to 3.5 cm. wide, entire, acute or acuminate, strongly triplinerved; panicles terminating stem and branches, rounded or narrow, many-headed; involucre about 4 mm. high; achenes 5-nerved, sparsely hispidulous; pappus brownish-tinged, 4 mm. long. "Canutillo," "hierba de Santo Domingo" (El Salvador).

27a. *Baccharis trinervis rhexioides* (H. B. K.) Baker in Mart. Fl. Bras. 6³: 73. 1882.

Baccharis rhexioides H. B. K. Nov. Gen. & Sp. 4: 66. 1820.

Baccharis trichoclada DC. Prodr. 5: 400. 1836.

San Luis Potosí and Tepic to Tabasco and Chiapas. Central and South America; type from Montán, Peru.

Stem and sometimes veins of lower leaf surface more or less densely sordid-tomentulose or puberulous; otherwise as in the typical form. "Barba fina" (Guatemala); "tapabarranco" (El Salvador); "Santo Domingo" (Costa Rica); "huichín prieto" (San Luis Potosí, *Seler*).

DOUBTFUL SPECIES.

BACCHARIS ASPERULA Schauer, *Linnaea* 19: 725. 1847. Said to be allied to *B. xalapensis* H. B. K.; the type is *Aschenborn* 464, from Zimapán, Hidalgo.

BACCHARIS LINIFOLIA DC. Prodr. 5: 420. 1836. Based on specimens collected by Haenke at Real del Monte, Hidalgo.

BACCHARIS POLYGALAEFOLIA H. B. K. Nov. Gen. & Sp. 4: 49. 1820. Based on specimens collected at Morán, Mexico, and in the Andes of Popayán, Colombia.

BACCHARIS SPATHULATA Schauer, *Linnaea* 19: 724. 1847. Collected in Mexico, without definite locality, by *Aschenborn* (no. 107). Said to be near *B. polygalaeifolia* H. B. K.

BACCHARIS TRICHOTOMA Klatt, *Leopoldina* 20: 91. 1884. Based on material collected in Mexico by *Liebmann*.

30. *ARCHIBACCHARIS* Heering, *Jahrb. Hamb. Wiss. Anst.* 21: Beih. 3: 40. 1904.

REFERENCE: Blake, *Hemibaccharis*, a new genus of Baccharidinae, *Contr. U. S. Nat. Herb.* 20: 543-554. *pl.* 48-51. 1924.

Characters of *Baccharis*, but plants polygamo-dioecious; staminate plants as in *Baccharis*; pistillate heads with 1 to 15 central hermaphrodite sterile flowers. Leaves amplexicaul; heads larger, the pistillate 10 mm. high, the staminate 5 to 8 mm. high.

Stem densely pubescent with spreading gland-tipped hairs... 1. *A. oxacana*.

Stem not glandular-pubescent..... 2. *A. pringlei*.

Leaves not amplexicaul; heads smaller, not over 5.5 mm. high.

Plants scandent or subscandent, the branches usually conspicuously zigzag; heads in usually small rounded panicles terminating the numerous wide-spreading branchlets.

Heads tiny, 2 to 3.5 mm. high; leaves chiefly ovate or elliptic.

3. *A. hirtella*.

Heads 4 to 5.5 mm. high; leaves chiefly oval or oval-ovate... 4. *A. torquis*.

Plants erect, not scandent, the branches straight; heads in large terminal panicles.

Stem densely cinereous- or griseous-puberulous or hirtellous, sometimes tomentose.....5. *A. mucronata*.

Stem glabrous or essentially so, at least below, and often glaucous, rarely sparsely arachnoid.

Leaves oval or ovate-oval, the larger 3 to 6 cm. wide...6. *A. sescenticeps*.

Leaves narrowly lanceolate to elliptic or oblong, the larger 1 to 3.5 cm. wide.

Leaves narrowly lanceolate, glabrous.....7. *A. androgyna*.

Leaves chiefly elliptic, pubescent at least on the veins beneath.

8. *A. asperifolia*.

1. *Archibaccharis oaxacana* (Greenm.) Blake.

Baccharis oaxacana Greenm. Proc. Amer. Acad. 40: 37. 1904.

Hemibaccharis oaxacana Blake, Contr. U. S. Nat. Herb. 20: 546. 1924.

Known only from the type locality, Sierra de San Felipe, Oaxaca.

Suffrutescent at the procumbent base, 20 to 50 cm. high; leaves chiefly obovate or oval, 4 to 8 cm. long, 1.5 to 3.5 cm. wide, including the rather abruptly contracted, petioliform, marginate and amplexicaul basal portion, shallowly mucronate-dentate; heads few in a terminal cymose panicle, the pistillate 1 cm. high, the staminate about 8 mm. high.

2. *Archibaccharis pringlei* (Greenm.) Blake.

Baccharis pringlei Greenm. Proc. Amer. Acad. 41: 225. 1905.

Hemibaccharis pringlei Blake, Contr. U. S. Nat. Herb. 20: 547. pl. 48. 1924.

Known only from the type locality, Sierra de San Felipe, Oaxaca.

Similar to *B. oaxacana*; leaves ovate, 4 to 12 cm. long, 2 to 5.5 cm. wide; inflorescence a terminal many-headed panicle; staminate heads 5 mm. high; pistillate heads unknown.

3. *Archibaccharis hirtella* (DC.) Heering, Jahrb. Hamb. Wiss. Anst. 21: Beih. 3: 41. 1904.

Baccharis scandens Less. Linnaea 5: 146. 1830. Not *B. scandens* Pers. 1807.

Baccharis hirtella DC. Prodr. 5: 418. 1836.

Baccharis schiedeana Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 83. 1852.

Baccharis thomasi Klatt, Abh. Naturf. Ges. Halle 15: 326. 1882.

Hemibaccharis hirtella Blake, Contr. U. S. Nat. Herb. 20: 549. 1924.

Typic to Veracruz and Oaxaca; type from Mexico, without definite locality. Guatemala.

Suffrutescent, scandent, up to 5 meters high; stem slender, sordidly glandular-puberulous or sometimes sordid-pilose; leaves short-petioled, the blades 2 to 6.5 cm. long, 1 to 2.5 cm. wide, acuminate, serrulate, pubescent or puberulous at least beneath.

4. *Archibaccharis torquis* Blake.

Hemibaccharis torquis Blake, Contr. U. S. Nat. Herb. 20: 550. pl. 51. 1924.

Veracruz and Oaxaca. Guatemala to Costa Rica; type from San José, Costa Rica.

Stouter than *A. hirtella*; leaves oval or oval-ovate, the blades 3 to 8 cm. long, 1.8 to 5 cm. wide, acute; panicles and heads larger.

5. *Archibaccharis mucronata* (H. B. K.) Blake.

Baccharis mucronata H. B. K. Nov. Gen. & Sp. 4: 60. 1820.

Pluchea floribunda Hemsl. Diag. Pl. Mex. 32. 1879.

Hemibaccharis mucronata Blake, Contr. U. S. Nat. Herb. 20: 550. 1924.

Chihuahua to Oaxaca; type collected between Santa Rosa and Los Ioares, Guanajuato.

Suffrutescent below, up to 2.5 meters high; stem densely and harshly griseous-puberulous; leaves chiefly ovate, petioled, the blades 4 to 11 cm. long, 1.5 to 5 cm. wide, serrate, very harsh above, puberulous beneath; heads very numerous, about 4 mm. high. "Hierba del carbonero" (Valley of Mexico).

A decoction of the flowers is reported to be used as a remedy for catarrh.

5a. *Archibaccharis mucronata paniculata* (Donn. Smith) Blake.

Diplostephium paniculatum Donn. Smith, Bot. Gaz. **23**: 8. 1897.

Hemibaccharis mucronata paniculata Blake, Contr. U. S. Nat. Herb. **20**: 551. 1924.

Veracruz to Oaxaca and Chiapas. Guatemala; type collected between San Martín and Todos Santos, Guatemala.

Pubescence soft; lower leaf surface and often the stem densely tomentose.

6. *Archibaccharis sescenticeps* Blake.

Hemibaccharis sescenticeps Blake, Contr. U. S. Nat. Herb. **20**: 552. 1924.

Jalisco to Mexico and Guerrero; type from Mount Ixtaccihuatl, State of Mexico.

Suffrutescent (?), stout, glabrous and glaucescent below or thinly arachnoid; leaves petioled, the blades 6 to 13 cm. long, 3 to 6 cm. wide, serrate, short-acuminate, smoothish above; heads 3.5 to 4.5 mm. high.

7. *Archibaccharis androgyna* (T. S. Brandeg.) Blake.

Baccharis androgyna T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 77. 1914.

Hemibaccharis androgyna Blake, Contr. U. S. Nat. Herb. **20**: 552. 1924.

Known only from the type locality, Cerro de Boquerón, Chiapas.

Slender, suffrutescent, glabrous throughout; leaves on short but slender petioles, the blades narrowly lanceolate, 5.5 to 9.5 cm. long, 1 to 1.8 cm. wide, falcate-attenuate, serrulate; panicles many-headed, terminal, 5 to 8 cm. wide; pistillate heads 3 to 4 mm. high.

8. *Archibaccharis asperifolia* (Benth.) Blake.

Baccharis asperifolia Benth. Pl. Hartw. 86. 1841.

Conyza asperifolia Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. **2**: 126. 1881.

Baccharis scabridula T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 77. 1914.

Hemibaccharis asperifolia Blake, Contr. U. S. Nat. Herb. **20**: 552. 1924.

Mexico to Chiapas. Guatemala to Nicaragua; type from Mixco, Guatemala.

Suffrutescent below, up to 3 meters high, essentially glabrous and usually glaucescent below; leaves chiefly elliptic, 4 to 11 cm. long, 1 to 3.5 cm. wide, acuminate, subentire or serrate; panicles large, with innumerable heads, these 2.5 to 5 mm. high.

DOUBTFUL SPECIES.

BACCHARIS ELEGANS SEEMANNII Schultz Bip. in Seem. Bot. Voy. Herald 303. 1856. This variety, described from the Sierra Madre, may belong in this genus. The description is very brief, and no specimens have been examined by the writer.

31. *PLUCHEA* Cass. Bull. Soc. Philom. Paris 1817: 31. 1817.

Shrubby or herbaceous; leaves alternate, entire or toothed; heads disciform, medium-sized, cymose or cymose-panicled, purplish or whitish; involucre several-seriate, of dry, often purplish phyllaries; outer flowers pistillate, several-seriate, with filiform corollas; inner flowers hermaphrodite; anthers sagittate at base, with caudate auricles; achenes small, 4 or 5-angled; pappus 1-seriate, setose.

Stem winged by the decurrent leaf bases.....1. *P. adnata*.
Stem wingless.

Leaves narrowly elliptic, silky-pubescent, sessile, 5 cm. long or less.

2. *P. sericea*.

Leaves broadly elliptic or oval, not silky-pubescent, petioled, 10 cm. long or more.....3. *P. odorata*.

1. *Pluchea adnata* (Humb. & Bonpl.) Mohr, Contr. U. S. Nat. Herb. 6: 790. 1901.

Baccharis adnata Humb. & Bonpl.; Willd. Enum. Pl. 2: 870. 1809.

Conyza adnata H. B. K. Nov. Gen. & Sp. 4: 74. 1820.

Pluchea subdecurrens Cass. Dict. Sci. Nat. 42: 4. 1826.

Sonora to Michoacán and Puebla. Guatemala; type from "America meridionali."

Suffrutescent, about 1 meter high, glandular and loosely pilose; leaves linear to lanceolate, 3.5 to 11 cm. long, 4 to 22 mm. wide, entire to sharply toothed, conspicuously decurrent; panicles 4 to 13 cm. wide, rounded; heads 4 to 8 mm. thick; involucre 3 to 5 mm. high; inner phyllaries caudate-attenuate. "Jara" (Michoacán or Guerrero).

1a. *Pluchea adnata canescens* (A. Gray) Blake.

Pluchea subdecurrens canescens A. Gray, Proc. Amer. Acad. 5: 182. 1861.

Sinaloa to Coahuila, Tamaulipas, and Guerrero; type from Tantoyuca, Veracruz.

Plant more or less densely canescent-tomentose. "Santa Isabel" (Tamaulipas).

1b. *Pluchea adnata parvifolia* (A. Gray) Blake.

Pluchea subdecurrens parvifolia A. Gray, Proc. Amer. Acad. 5: 160. 1861.

Southern Baja California; type from vicinity of Cape San Lucas.

Very densely viscid-glandular, with few or no long hairs; heads 7 to 12 mm. thick; involucre 5 to 6 mm. high.

2. *Pluchea sericea* (Nutt.) Coville, Contr. U. S. Nat. Herb. 4: 128. 1893.

Polypappus sericeus Nutt. Journ. Acad. Phila. II. 1: 178. 1848.

Tessaria borealis "DC.;" Torr. & Gray in Emory, Mil. Recon. 143. 1848, nomen nudum.

Pluchea borealis A. Gray, Proc. Amer. Acad. 17: 212. 1882.

Berthelotia sericea Rydb. Bull. Torrey Club 33: 154. 1906.

Sonora, Chihuahua, and Baja California. Southwestern United States; type from California.

Shrub up to 5 meters high, silky-canescens, very leafy; leaves narrowly elliptic or lance-elliptic, entire; corymbs small, terminating branches and branchlets; phyllaries ovate to oblong, obtuse to acute. "Cachanilla," "cachimilla" (California, Texas, New Mexico).

The shrub is abundant in many places in the alluvial soil of river valleys, often forming dense and pure stands. By the Indians the slender straight stems were used for the shafts of arrows and for making bird cages, storage bins, and baskets. An infusion of the stems was employed by the Pimas as a remedy for sore eyes.

3. *Pluchea odorata* Nat. (L.) Cass. Dict. Sci. Nat. 42: 3. 1826.

Conyza odorata L. Syst. Nat. ed. 10. 2: 1213. 1759.

?*Conyza cortesii* H. B. K. Nov. Gen. & Sp. 4: 75. 1820.

?*Pluchea cortesii* DC. Prodr. 5: 452. 1836.

Baja California and Sinaloa to Tamaulipas, south to Yucatán. Florida, Central and South America, West Indies; type from Jamaica.

Shrubby, 2.5 meters high or less, the stem cinereous-tomentose or sordid-tomentose, glabrescent below; petioles 1 to 2.5 cm. long; leaf blades elliptic to oval or oblong-ovate, 6 to 20 cm. long, 2.5 to 10 cm. wide, entire or sometimes repand-denticulate, paler and sordid-tomentulose beneath; panicles usually 10 to 20 cm. wide. "Santa María" (Tamaulipas, Yucatán); "alinanche" (Sinaloa); "hierba de Santa María" (Nuevo León); "chalché" (Yucatán, Guatemala, Maya); "canela," "canelón" (Baja California); "chalchay" (Yucatán); "su-

quinay" (Guatemala, El Salvador); "ciguapate" (El Salvador); "salvia" (Porto Rico, Nicaragua); "salvia de playa," "salvia cimarrona," "salvia del país" (Cuba); "nahuapate," "suquinayo," "suquinay," "siguapete" (El Salvador).

In the Bahamas the shrub is called "sour-bush." The flowers are said to be a source of honey. In Tamaulipas an infusion of the leaves in alcohol is applied externally to relieve neuralgia and rheumatism. Seler reports that in Yucatán the leaves are heated and applied hot as a hemostatic, while in the same State the plant is employed as a febrifuge and emmenagogue. Descourtilz states that in the West Indies the plant was used as a remedy for the bites of venomous animals and that a decoction of the leaves was taken as a remedy for stomach affections.

32. *ACHYROCLINE* (Less.) DC. Prodr. 6: 219. 1837.

1. *Achyrocline ventosa* Klatt, *Linnaea* 42: 112. 1878.

Gnaphalium ventosum Schultz Bip.; Klatt, *Linnaea* 42: 112. 1878, as synonym.

Known only from the type locality, Cerro Ventoso, Mexico.

"Suffruticose," the ascending stems about 15 cm. high, white-lanate; leaves lanceolate, 2.5 to 4 cm. long, about 4 mm. wide, acuminate, undulate, amplexicaul-decurrent, densely lanate, subglabrescent above; heads about 4 mm. long, cylindrical, crowded in dense glomerules; involucre lanate at base, the phyllaries acute, ochraceous; pistillate flowers 3, hermaphrodite 1.

Only a fragment of the type, accompanied by sketches, has been examined, and the status of the species is uncertain.

33. *GNAPHALIUM* L. Sp. Pl. 850. 1753.

Herbaceous, rarely suffrutescent, tomentose; leaves alternate, entire; heads small, cymose or paniced, often glomerate; involucre graduate, of scarious phyllaries; heads many-flowered, disciform, the outer flowers pistillate, with filiform corollas, the inner flowers hermaphrodite, tubular, all whitish or purplish red (in the following species); anthers caudate at base; pappus setose, the bristles in the hermaphrodite flowers sometimes clavellate.

Larger leaves 3 to 7.5 cm. long.

Leaves obovate, about 12 mm. wide; outer phyllaries ochroleucous at base.

1. *G. eleagnoides*.

Leaves linear or lance-linear, 6 mm. wide or less; phyllaries brown or greenish brown at base.

Pappus bristles of the hermaphrodite flowers obscurely thickened toward tip; leaves arachnoid-tomentose above.....2. *G. rhodanthum*.

Pappus bristles of the hermaphrodite flowers strongly thickened toward tip; leaves soon glabrate above.....3. *G. seemanii*.

Larger leaves 2 cm. long or less.

Leaves obovate, 3 to 8 mm. wide.....4. *G. concinnum*.

Leaves linear, 2 mm. wide or less.

Heads distinctly pedicellate.....5. *G. sartorii*.

Heads sessile or subsessile.....6. *G. lavandulaceum*.

1. *Gnaphalium eleagnoides* (Klatt) Blake.

Chionolaena eleagnoides Klatt, *Leopoldina* 23: 88. 1887.

Gnaphalium hypochionaeum Schultz Bip.; Klatt, *Leopoldina* 23: 88. 1887, as synonym.

Known only from the type locality, Pelado, Mexico.

Densely leafy, white-corticate; leaves obovate, 3 to 4.5 cm. long, about 12 mm. wide, acute, callous-apiculate, narrowed to the "amplexicaul" base, entire, arachnoid above glabrate, beneath densely and canescently lanate-tomentose;

heads $\frac{1}{2}$ to 5 mm. high, in small dense cymose glomerules, short-pedicellate; phyllaries obovate, the lower ochroleucous, the upper white; pistillate flowers 16, hermaphrodite 18.

2. *Gnaphalium rhodanthum* Schultz Bip. in Seem. Bot. Voy. Herald 310. 1856.

Hidalgo to Oaxaca and Chiapas; type from Jitotole, Chiapas. Guatemala.

Suffrutescent, 40 cm. high or less, densely leafy; stem cinereous or canescent-tomentose; leaves linear or narrowly linear-lanceolate, the larger 3 to 7.5 cm. long, 1.5 to 5 mm. wide, usually greenish above, densely tomentose beneath, the older deflexed, marcescent; heads in small rounded cymose panicles; outer phyllaries oblong or linear-oblong, the inner linear, obtuse, with white or reddish purple tips.

3. *Gnaphalium seemannii* Schultz Bip. in Seem. Bot. Voy. Herald 309. 1856. *Chionolaena corymbosa* Hemsl. Diagn. Pl. Mex. 32. 1879.

Known only from the type locality, Sierra Madre of northern Mexico.

Suffrutescent, about 17 cm. high, the stem closely and when young canescently lanate-tomentose; leaves elliptic-linear or linear-oblong, 1.8 to 4.5 cm. long (including the petioliform base), 3 to 5 mm. wide, quickly glabrate and green above, densely and canescently silky-pannose-tomentose beneath; heads cymose-panicled, short-pedicelated, about 8 mm. high; outer phyllaries suborbicular-ovate, with a brown spot, the inner oblong-linear, rounded, whitish, with a brownish spot near middle.

4. *Gnaphalium concinnum* A. Gray, Proc. Amer. Acad. 15: 34. 1879.

San Luis Potosí; type from highest mountains southeast of City of San Luis Potosí.

Suffrutescent, 20 to 35 cm. high, several-stemmed; stems densely and subcanescently tomentose, very leafy; leaves obovate, 10 to 20 mm. long, 3 to 8 mm. wide, above arachnoid-tomentose, glabrescent, densely griseous- or ochroleucous-lanate beneath; heads in a nearly leafless cymose panicle, about 6 mm. high; phyllaries pink-purple below, the white tips of the middle and outer ones reflexed at maturity.

5. *Gnaphalium sartorii* (Klatt) Schultz Bip.

Chionolaena sartorii Klatt, Leopoldina 23: 89. 1887.

Gnaphalium sartorii Schultz Bip.; Klatt, Leopoldina 23: 89. 1887, as synonym.

Known only from the type locality, Sempoaltepec, Mexico.

Low, suffruticose, gray-tomentose; leaves linear, 9 to 18 mm. long, 1 mm. wide, arachnoid above, griseous-tomentose beneath; heads pedicellate, ternate, campanulate; phyllaries fuscous, lanceolate. (Description mostly compiled.)

6. *Gnaphalium lavandulaceum* DC. Prodr. 5: 227. 1837.

Elychrysum lavandulaefolium H. B. K. Nov. Gen. & Sp. 4: 86. 1820.

Chionolaena lavandulaceum Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 134. 1881.

Gnaphalium lavandulaefolium Blake, Contr. Gray Herb. n. ser. 52: 21. 1917.

Not *G. lavandulaefolium* Willd. 1804.

Highest mountains of Mexico and Veracruz; type from Mount Nauhecampetle, near Perote, Mexico.

Suffrutescent, 30 cm. long or less, griseous- or cinereous-tomentose; leaves very crowded, linear-spatulate to linear, obtuse; heads campanulate, 1 to 3 at tips of branchlets, 7 to 9 mm. long; phyllaries fuscous at base, with whitish tips.

34. **PELUCHA** S. Wats. Proc. Amer. Acad. 24: 55. 1889.

1. *Pelucha trifida* S. Wats. Proc. Amer. Acad. 24: 55. 1889.

Central Baja California and islands in the Gulf of California; type from San Pedro Mártir Island, Gulf of California.

Heavy-scented shrub about 1 meter high, much branched, thinly gray-tomentose, glabrescent; leaves alternate, 5 to 18 mm. long, 3-toothed or 3-cleft, with linear lobes, fleshy; heads 8 to 10 mm. high, in small terminal cymose panicles, about 21-flowered; involucre 2-seriate, subequal, 4 to 5 mm. high, the phyllaries lanceolate, obtuse, appressed, subherbaceous, tomentulose; flowers all hermaphrodite, tubular; anthers sagittate-caudate; achenes oblong-turbinate, densely silky-pubescent, 2 mm. long; pappus 4 mm. long, stiff, of about 10 longer barbelate bristles and about three times as many irregularly somewhat connate shorter bristles.

35. NOCCA Cav. Icon. Pl. 3: 12. *pl.* 224. 1795.

REFERENCE: Robinson, Synopsis of the genus *Nocca*, Proc. Amer. Acad. 36: 467-471. 1901.

Shrubs or herbs; leaves mostly opposite; heads 1 or 2-flowered, densely crowded at tips of stem and branches in campanulate or globose glomerules, these subtended by herbaceous bracts; proper involucre tubular, gamophyllous, 5 or 6-toothed; corollas tubular, yellow, white, or purple, exserted; achene columnar; pappus a short cup, usually with awns or squamellae added.

Involucres 2-flowered..... 1. *N. biflora*.
Involucres 1-flowered.

Leaves sessile, cordate-clasping.

Inflorescence short, leafy-bracted; leaves all with broadly clasping base.

2. *N. helianthifolia*.

Inflorescence elongate, the bracts small; lower leaves sessile, not clasping.

3. *N. media*.

Leaves petiolate (the petiole rarely leafy-margined), not cordate-clasping.

Glomerules campanulate, sessile or subsessile.

Leaves densely silvery-silky beneath at maturity.

4. *N. heteropappus*.

Leaves not densely silvery-silky beneath at maturity, sometimes slightly so when young in no. 7.

Leaves finely serrulate with purple-glandular teeth (about 10 per cm.).

5. *N. mocinniana*.

Leaves coarsely serrate (teeth 2 to 4 per cm.) to subentire.

Stem finely puberulous with appressed hairs, also more or less glandular, without long spreading hairs..... 6. *N. rigida*.

Stem pubescent with long wide-spreading hairs, at least in the inflorescence, as well as glandular.

Leaves elliptic to lance-oblong, three to five times as long as wide.

7. *N. angustifolia*.

Leaves ovate or lance-ovate, two and one-half times as long as wide, or less.

Leaves green beneath; petioles usually winged.

8. *N. pteropoda*.

Leaves griseous-pubescent beneath; petioles naked.

Leaves broadly ovate, 5.5 to 7 cm. long; branches of inflorescence elongate, divergent..... 9. *N. pringlei*.

Leaves lance-ovate, 7.5 to 12.5 cm. long; inflorescence contracted, its branches suppressed..... 10. *N. tomentosa*.

Glomerules globose or subglobose, slender-peduncled.

Teeth of the proper involucre lance-subulate.

Leaves subserrate-pilose beneath with appressed hairs; proper involucre silky-villous..... 11. *N. decipiens*.

Leaves rather harshly pubescent beneath; proper involucre usually hirsute..... 12. *N. glandulosa*.

Teeth of the proper involucre ovate to triangular-lanceolate (rarely lanceolate in no. 14).

Stem and branches of inflorescence pubescent-----13. *N. liebmannii*.
Stem and branches of inflorescence essentially glabrous.

14. *N. palmeri*.

1. *Nocca biflora* (Hemsl.) Kuntze, Rev. Gen. Pl. 1: 354. 1891, as *Noccaea*.

Lagascea biflora Hemsl. Diag. Pl. Mex. 33. 1879.

Oaxaca; type from Mexico, without definite locality.

Shrubby, pubescent; leaves petioled, ovate-lanceolate, 2.5 to 5 cm. long, denticulate; involucre villous; corollas glabrous; achenes hirsute; paleae of pappus subequal. (Description compiled.)

2. *Nocca helianthifolia* (H. B. K.) Cass. Diet. Sci. Nat. 25: 104. 1822, as *Noccaea*.

Lagascea helianthifolia H. B. K. Nov. Gen. & Sp. 4: 25. 1820.

Jalisco to Oaxaca; type from Acapulco, Guerrero.

Suffrutescent (?), about 2.5 meters high, very leafy, branching in the inflorescence; stem glandular-puberulous, and spreading-hispid-pilose with mostly deciduous hairs; leaves ovate or oblong-ovate, 6 to 21 cm. long, serrate, scabrous above, scabrous or scabrid beneath; glomerules large, leafy-bracted; involucre silky-villous, unequally dentate; corollas about 1.5 cm. long, "yellowish white."

2a. *Nocca helianthifolia suaveolens* (H. B. K.) Robinson, Proc. Amer. Acad. 36: 468. 1901.

Lagascea suaveolens H. B. K. Nov. Gen. & Sp. 4: 25. 1820.

Noccaea suaveolens Cass. Diet. Sci. Nat. 25: 105. 1822.

Nocca latifolia Cerv. in Llave & Lex. Nov. Veg. Deser. 1: 31. 1824.

Lagascea latifolia DC. Prodr. 5: 92. 1836.

Lagascea helianthifolia suaveolens Robinson, Proc. Amer. Acad. 43: 38. 1907.

Sinaloa to Veracruz and Oaxaca; type collected between Río Papagallo and Venta Colorada, Mexico. Guatemala and El Salvador.

Similar; leaves often broader, softly pubescent beneath. "Lengua de vaca" (El Salvador).

2b. *Nocca helianthifolia adenocaulis* (Robinson) Blake.

Lagascea helianthifolia adenocaulis Robinson, Proc. Amer. Acad. 43: 38. 1907.

Known only from the type locality, Uruapan, Michoacán.

Stem densely glandular-puberulous, without long hairs; leaves scabrous above, tomentellous beneath.

2c. *Nocca helianthifolia levior* Robinson, Proc. Amer. Acad. 36: 468. 1901.

Lagascea helianthifolia levior Robinson, Proc. Amer. Acad. 43: 38. 1907.

Tepic to Michoacán or Guerrero; type from Colima.

Stem finely and densely puberulent, without long hairs or glands; leaves puberulent beneath.

3. *Nocca media* Blake, Contr. U. S. Nat. Herb. 22: 596. 1924.

Known only from the type locality, between Tixila and Chilpancingo, Guerrero.

Herbaceous, at least above, finely hirtellous and sparsely hispid-pilose; leaves ovate, 6 to 8 cm. long, the upper clasping, the lower narrowed to a sessile, not clasping base, scabrid on both sides; proper involucre silky-villous; corolla about 10 mm. long.

4. *Nocca heteropappus* (Hemsl.) Kuntze, Rev. Gen. Pl. 1: 354. 1891, as *Noccaea*.

Lagascea heteropappus Hemsl. Diag. Pl. Mex. 33. 1879.

Michoacán; type from Mexico, without definite locality.

Shrub 1 meter high; leaves ovate to elliptic, 4 to 7.5 cm. long, green above; proper involucre silky-villous, with slender subulate teeth; pappus of 2 awns and several squamellae.

5. *Nocca mocinniana* (DC.) Kuntze, Rev. Gen. Pl. 1: 354. 1891, as *Noccaea mocinniana*.
Lagascea mocinniana DC. Prodr. 5: 92. 1836.
 Mexico, without definite locality.
 Leaves ovate, acute, green on both sides, finely serrulate. (Description compiled.)
 A dubious species. The names "casanaca" and "zazanaca" have been reported for this species, but perhaps relate to some other one.
6. *Nocca rigida* Cav. Icon. Pl. 3: 12. pl. 224. 1795.
Lagascea rubra H. B. K. Nov. Gen. & Sp. 4: 24. pl. 311. 1820.
Noccaea rubra Cass. Diet. Sci. Nat. 25: 104. 1822.
 Mexico to Puebla; type from Mexico, without definite locality.
 Suffrutescent, about 2.5 meters high; leaves ovate or elliptic-ovate, 5 to 8.5 cm. long, green and scabrid on both sides; proper involucre silky-villous, with lance-subulate, unequal teeth; corollas "red."
7. *Nocca angustifolia* (DC.) Kuntze, Rev. Gen. Pl. 1: 354. 1891, as *Noccaea*.
Lagascea angustifolia DC. Prodr. 5: 92. 1836.
 Durango to Jalisco; type from León, Guanajuato.
 Shrubby; leaves 3.5 to 10.5 cm. long, subsericeous beneath when young, in age usually scabrid; proper involucre densely silky-villous.
8. *Nocca pteropoda* Blake, Contr. U. S. Nat. Herb. 22: 597. 1924.
 Known only from the type locality, Cuyamecala, Cuicatlán, Oaxaca.
 Suffrutescent(?), densely spreading-villous and stipitate-glandular on the branchlets, glabrate; leaf blades rhombic-ovate or oval, 4.5 to 10 cm. long, subsessile by a contracted cuneate-winged base or short-petioled, rough above, rather sparsely pilosulous beneath, serrate; inflorescence ternately divided, broad and short, the glomerules large, leafy-bracted.
9. *Nocca pringlei* Robinson, Proc. Amer. Acad. 36: 469. 1901.
Lagascea pringlei Robinson, Proc. Amer. Acad. 43: 38. 1907.
 Known only from the type locality, Iguala, Guerrero.
 Suffrutescent, 1 to 2 meters high, puberulous and villous; leaves densely cinereous-pilose beneath; teeth of the silky-villous proper involucre lanceolate, very unequal; corollas 12 mm. long, purple.
10. *Nocca tomentosa* (Robins. & Greenm.) Robinson, Proc. Amer. Acad. 36: 470. 1901.
Lagascea tomentosa Robins. & Greenm. Proc. Amer. Acad. 32: 43. 1896.
 Known only from the type locality, between Ayusinapa and Petatlán, Guerrero.
 Stem pilose and densely glandular-puberulous; leaves lance-ovate, 7.5 to 12.5 cm. long, gray-tomentose on both sides; bracts ovate-lanceolate; proper involucre villous, 6 mm. long, the teeth lanceolate, unequal; corollas 12 mm. long.
11. *Nocca decipiens* (Hemsl.) Kuntze, Rev. Gen. Pl. 1: 354. 1891, as *Noccaea*.
Lagascea decipiens Hemsl. Diag. Pl. Mex. 33. 1879.
 Sonora to Chihuahua and Jalisco; type from the Sierra Madre of northern Mexico.
 Shrubby; leaves ovate, 3 to 6.5 cm. long, acuminate; peduncles terminal and subterminal, up to 5.5 cm. long; corollas apparently whitish, 7.5 mm. long.
12. *Nocca glandulosa* (Fernald) Robinson, Proc. Amer. Acad. 36: 470. 1901.
Lagascea glandulosa Fernald, Bot. Gaz. 20: 534. 1895.
 Sinaloa and Chihuahua; type from head of Mazatlán River, Sinaloa.
 This species is said to be scandent.

13. *Nocca liebmannii* (Schultz Bip.) Robinson, Proc. Amer. Acad. 36: 470. 1901.

Lagascea liebmannii Schultz Bip.; Klatt, Leopoldina 20: 91. 1884.

Known only from the type locality, Pochutla, Oaxaca.

Suffruticose; leaves elliptic, 5 cm. long, soft-pubescent beneath; proper involucre finely villous. (Description compiled.)

14. *Nocca palmeri* Robinson, Proc. Amer. Acad. 36: 471. 1901.

Lagascea palmeri Robinson, Proc. Amer. Acad. 43: 38. 1907.

Known only from the type locality, Colima.

Slender shrub; leaves ovate, 1.5 to 4 cm. long, scabrous on both sides, subentire; proper involucre sparsely villous chiefly at base; corollas 6 mm. long, apparently white.

DOUBTFUL SPECIES.

- Nocca robinsonii* (A. Nels.) Blake.

"*Nocca* n. sp. [?]" Robinson, Proc. Amer. Acad. 36: 468. 1901.

Calhounia robinsonii A. Nels. Univ. Wyo. Publ. Bot. 1: 59. 1924.

Mexico, without definite locality.

Pubescence of the branches fine, spreading, the hairs partly glandular, all of equal length; leaves elliptic, obtuse or short-acuminate, scabrous, gray-pubescent beneath, remotely denticulate, short-petioled. (Description compiled.)

36. **COULTERELLA** Vasey & Rose, Contr. U. S. Nat. Herb. 1: 71. pl. 1. 1890.

1. *Coulterella capitata* Vasey & Rose, Contr. U. S. Nat. Herb. 1: 71. pl. 1. 1890.

Vicinity of La Paz, Baja California.

Much-branched glabrous shrub, about 1.3 meters high, lemon-scented; leaves opposite or alternate, rhombic-ovate to elliptic-oblong, 2.5 cm. long or less, sessile and clasping, coarsely few-toothed to entire, very fleshy; proper involucre gamophyllous, at maturity obovoid, 3-winged and corky, shortly 3-toothed at the contracted apex, 7 to 10 mm. long, glomerate at tips of branches, subtended by minute bracts, 1-flowered (very rarely 2-flowered); corollas yellow, the throat very short, the teeth lance-linear, 3-veined, exceeding the tube and throat; anthers sagittate-mucronate; styles slender, with very short obscure appendages, merely papillose outside; achenes columnar, multistriate, glabrous, 3.8 mm. long, epappose, crowned with a detergent cup left by the base of the corolla.

37. **DESMANTHODIUM** Benth. in Hook. Icon. Pl. 12: 14. pl. 1116. 1873.

Shrubs or herbs; leaves opposite, thickish, serrate; heads few-flowered, small, numerous, glomerulate in cymose panicles; phyllaries few, subscarios; pistillate flowers 1 to 3, loosely inclosed in sac-shaped membranaceous phyllaries with short tubular apex, their corollas tubular-cylindric, subtruncate, white; paleae of receptacle few; hermaphrodite flowers 4 to 6, regular, 5-toothed, sterile; achenes inclosed in the sac-shaped phyllaries, epappose.

Stem densely villous-tomentose, glabrescent; leaves broadly ovate, 5 to 7 cm. wide.....1. **D. tomentosum**.

Stem glabrous or puberulous in lines; leaves elliptic to obovate, 4.5 cm. wide or less.

Leaves short-petioled.....2. **D. fruticosum**.

Leaves connate-perfoliate.....3. **D. perfoliatum**.

1. *Desmanthodium tomentosum* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 73. 1914.

Known only from the type locality, Cerro del Boquerón, Chiapas.

Shrub; leaf blades 9 to 13 cm. long, acuminate, cuneate at base, petiolate, villous-tomentose beneath, particularly on the veins; heads about 4 mm. high, in dense glomerules.

2. *Desmanthodium fruticosum* Greenm. Proc. Amer. Acad. 40: 37. 1904.

Jalisco and Michoacán or Guerrero; type from Zapotlán, Jalisco.

Shrubby below, 1.5 meters high; leaves elliptic or ovate, 4 to 9 cm. long, quintuplinerved above the base, sordid-puberulous on the veins beneath; heads tiny, 3 to 4 mm. high.

3. *Desmanthodium perfoliatum* Benth. in Hook. Icon. Pl. 12: 15. *pl.* 1116. 1873.

Flaveria perfoliata Klatt, Leopoldina 23: 146. 1887.

Oaxaca.

Shrubby, with herbaceous branches, glaucescent, 3 to 6 meters high; leaves rhombic-lanceolate to obovate, 6 to 12.5 cm. long, penninerved or weakly trip-linerved, glabrous or with a few minute hairs along costa beneath; heads 5 to 7 mm. high.

38. **CLIBADIUM** Allamand; L. Mant. Pl. 161. 1771.

REFERENCE: O. E. Schulz, Beiträge zur Kenntnis der Gattung *Clibadium*, Bot. Jahrb. Engl. 46: 613-628. 1912.

Shrubby; leaves opposite, serrate, disciform, whitish, cymose-paniced; phyllaries few, dryish; pistillate flowers subtended by pales, their corollas slender-tubular, denticulate; disk flowers hermaphrodite, sterile, without pales (in ours), their corollas 5-toothed; achenes abovoid, obcompressed, epappose.

Some species of this genus are used in tropical America as fish poisons.

Heads 5 to 6 mm. high; phyllaries ciliate, densely strigillose at least above achenes 2.8 to 3 mm. long-----1. **C. arboreum**.

Heads 3.5 to 4 mm. high; phyllaries ciliate, otherwise essentially glabrous; achenes 1.8 to 2 mm. long-----2. **C. pueblanum**.

1. **Clibadium arboreum** Donn. Smith, Bot. Gaz. 14: 26. 1889.

Clibadium asperum Hensl. Biol. Centr. Amer. Bot. 2: 142. 1881, in part.

Not *C. asperum* DC. 1836.

Clibadium donnell-smithii Coulter, Bot. Gaz. 16: 98. 1891.

Veraacruz. Guatemala; type from Pansamalá, Guatemala.

Shrubby, 3 meters high; stem densely pubescent; leaf blades ovate or broad-ovate, 10 to 23 cm. long, 5 to 19 cm. wide, long-petioled; pistillate flowers 3 to 6, hermaphrodite 9 to 11.

2. **Clibadium pueblanum** Blake, Contr. U. S. Nat. Herb. 22: 601. 1924.

Known only from the type locality, Pahuatlán, Puebla.

Similar; leaf blades 10.5 to 14.5 cm. long; pistillate flowers 6 or 7, hermaphrodite 7 or 8.

39. **GUARDIOLA** Cerv.; Humb. & Bonpl. "Pl. Aequin. 1: 143. *pl.* 41. 1808."

REFERENCE: Robinson, Revision of the genus *Guardiola*, Bull. Torrey Club 26: 232-235. 1899.

Suffrutescent or herbaceous, with opposite leaves and small, terminal, solitary to cymose-paniced, yellow heads; involucre cylindric to campanulate, of few subequal subherbaceous thin-margined many-nerved phyllaries; rays small, fertile, the disk sterile; achenes columnar or columnar-obovoid, epappose.

Phyllaries carinate, about 12 mm. high; leaves deltoid-ovate---1. **G. carinata**.

Phyllaries not carinate, 7 to 9 mm. high; leaves narrowly lanceolate.

Leaves cuneate at base-----2. **G. angustifolia**.

Leaves hastate at base-----3. **G. stenodonta**.

1. *Guardiola carinata* Robinson, Bull. Torrey Club 26: 233. 1899.

Known only from the type locality, Acaponeta, Tepic.

Suffrutescent, glabrous and glaucous; petioles about 1.2 cm. long; leaf blades 3 to 4 cm. long, 2 to 3 cm. wide, cordate-hastate, serrulate, obtusish; heads few or solitary.

2. *Guardiola angustifolia* (A. Gray) Robinson, Bull. Torrey Club 26: 235. 1899.

Guardiola tulocarpus angustifolia A. Gray in S. Wats. Proc. Amer. Acad. 22: 423. 1887, hyponym.

Jalisco; type from Tequila.

Suffrutescent, about 60 cm. high, essentially glabrous; petioles 6 to 14 mm. long; leaf blades 5 to 10 cm. long, 4 to 23 mm. wide, acuminate, sharply serrate or serrulate; heads numerous in small cymose panicles.

3. *Guardiola stenodonta* Blake, Proc. Biol. Soc. Washington 37: 56. 1924.

Known only from the type locality, Balboa, Sinaloa.

Suffrutescent, practically glabrous; leaves slender-petioled, the blades 5 to 8 cm. long, 1.5 to 2.2 cm. wide at base across the very narrow spreading lobes, abruptly contracted above them and then widened to middle, serrate; heads in small terminal clusters.

40. *MELAMPODIUM* L. Sp. Pl. 921. 1753.

REFERENCE: Robinson, Synopsis of the genus *Melampodium*, Proc. Amer. Acad. 36: 455-466. 1901.

Herbs, or sometimes suffrutescent; leaves opposite; heads radiate, the rays fertile, yellow or white, the disk sterile; outer phyllaries usually 5, subherbaceous; receptacle paleaceous; ray achenes tightly enveloped in the subtending indurate phyllaries, these often provided with a hood or horn at apex; pappus none.

Rays white; leaves not silky-pubescent.

Stem and leaves densely cinereous-tomentose.....1. *M. argophyllum*.

Stem and leaves green or cinereous-pubescent, not tomentose.

Lamina of the rays 5 to 8 mm. long, not prominently venose.

2. *M. cinereum*.

Lamina of the rays 1 to 1.3 cm. long, prominently venose.

3. *M. leucanthum*.

Rays yellow; leaves silky-pubescent beneath, at least when young.

Fruiting phyllaries with well-developed hood.....4. *M. nelsonii*.

Fruiting phyllaries with obsolete hood.....5. *M. heterophyllum*.

1. *Melampodium argophyllum* (A. Gray) Blake, Contr. U. S. Nat. Herb. 22: 606. 1924.

Melampodium cinereum argophyllum A. Gray; Robinson, Proc. Amer. Acad. 36: 458. 1901.

Coahuila and Nuevo León; type from the Sierra Madre south of Saltillo, Coahuila.

Suffruticulose, about 20 cm. high; similar to *M. cinereum* except for its cinereous-tomentose pubescence.

2. *Melampodium cinereum* DC. Prodr. 5: 518. 1836.

Coahuila; type from "near San Fernando, Mexico."¹ Texas.

Suffruticulose, several-stemmed, much branched, about 20 cm. high, cinereous-pubescent; leaves linear to lance-oblong, 2.5 to 4 cm. long, entire to deeply sinuate-lobed; fruiting phyllaries with muticous hood.

¹ According to Gray, Syn. Fl. 1²: 239. 1884, the habitats and numbers of specimens cited under *M. cinereum* and *M. ramosissimum* were interchanged in De Candolle's Prodrum.

- 2a. *Melampodium cinereum ramosissimum* (DC.) A. Gray, Syn. Fl. 1²: 239. 1884.

Melampodium ramosissimum DC. Prodr. 5: 518. 1836.

Coahuila. Texas; type from "Texas."

Hood of the fruiting phyllaries mucronate; otherwise as in the typical form.

3. *Melampodium leucanthum* Torr. & Gray, Fl. N. Amer. 2: 271. 1842.

Chihuahua. Kansas to Texas and Arizona; type from Texas.

Similar to *M. cinereum*; usually about 30 cm. high; leaves often entire; heads much larger; hood of the fruiting phyllaries muticous.

4. *Melampodium nelsonii* Greenm. Proc. Amer. Acad. 41: 260. 1905.

Definitely known only from the type locality, Volcán de Jorullo, Michoacán.

Suffruticulose, hirsute; leaves linear or linear-lanceolate, entire or pinnately 3-lobed; heads 1 to 1.5 cm. wide; hood of the fruiting phyllaries sometimes with caudate apex.

5. *Melampodium heterophyllum* Lag. Gen. & Sp. Nov. 33. 1816.

Tamaulipas to Oaxaca; type from Mexico.

Herbaceous or suffruticulose, up to 40 cm. high; leaves linear to lanceolate, entire or with long narrow lobes toward base; heads about 12 mm. wide.

41. PARTHENIUM L. Sp. Pl. 988. 1753.

REFERENCES: J. M. Hillier, Guayule rubber (*Parthenium argentatum*, A. Gray), Kew Bull. 1907: 285-294. 1907; F. E. Lloyd, Guayule (*Parthenium argentatum* Gray), a rubber-plant of the Chihuahuan desert, Carnegie Inst. Washington Publ. 139. 1911; C. Patoni, El guayule (*Parthenium argentatum* A. Gray). Mexico, 1916.

Shrubs or herbs; leaves alternate; heads small, radiate, white, in terminal cymes or panicles; phyllaries usually 2-seriate, suborbicular, dry; rays short, erect, fertile, the disk sterile; ray achenes obcompressed, their nerviform margins adnate at base to the involute paleae of the two opposed outer disk flowers and at maturity separating from the body of the achene nearly to apex, the whole falling together; pappus 2 or 3 short awns or none.

Leaves silvery-canescens on both sides..... 1. *P. argentatum*.

Leaves not silvery-canescens, usually tomentose or velutinous beneath.

Leaves ovate, subentire to repand or crenate, not lobed.

Leaves harshly hispidulous above with tuberculate-based hairs.

Pappus wanting..... 2. *P. parviceps*.

Pappus present.

Leaves densely cinereous-tomentulose beneath..... 3. *P. fruticosum*.

Leaves green or greenish and merely strigillose or puberulous beneath.

4. *P. schottii*.

Leaves smooth or only slightly asperulous above.

Pappus present..... 4. *P. schottii*.

Pappus wanting.

Leaves conspicuously crenate; involucre 2.5 to 3.5 mm. high.

5. *P. tomentosum*.

Leaves rather obscurely repand or crenulate; involucre 1.5 to 2 mm. high..... 6. *P. stramonium*.

Leaves triangular to obovate, hastately or lyrate lobed or pinnatifid; pappus present.

Leaves triangular to obovate, lyrate-pinnatifid or lobed, usually gray and floccose-tomentose above..... 7. *P. incanum*.

Leaves deltoid-ovate, coarsely lobed, green and somewhat harshly pubescent above..... 8. *P. lozanium*.

1. *Parthenium argentatum* A. Gray in Torr. U. S. & Mex. Bound. Bot. 86. 1859.

Parthenium lloydii Bartlett, *Torreyia* 16: 46. 1916.

Coahuila and Durango to Zacatecas and San Luis Potosí. Texas; type from Esccondido Creek.

Shrubby, up to 1 meter high, much branched; branches silvery-strigillose; petioles 0.5 to 2.5 cm. long; blades lanceolate to lance-ovate, 1 to 4.5 cm. long, 0.3 to 2.5 cm. wide, acute or acuminate, acute at base, coarsely few-lobed to entire, silvery-canescenscent; heads several, in small long-peduncled cymes or cymose panicles, short-pedicelcd, about 6 mm. wide; pappus of 2 divergent or erectish awns about 1 mm. long. "Guayule" (the most common and widely distributed name); "hierba del hule" (Durango); "tataniní" (Otomí); "hierba blanca," "hierba ceniza" (Querétaro); "hule" (Zacatecas, Chihuahua); "copallín," "afinador" (*Lloyd*); "xihuíté," "jihuite" (Zacatecas).

According to Patoni, the name "guayul" or "guayul," of which guayule is a variant, belongs properly to *Vauquelinia corymbosa* (see page 323), and became applied through some error to this plant.

The guayule rubber plant is one of the most important members of the Mexican flora. Its stems yield a high percentage of rubber, a fact well known to the early inhabitants. From the plant was obtained the rubber for making the large balls used in the game of *pelota*, a game of very ancient origin.

Attempts at industrial exploitation of the plant began in Zacatecas as early as 1892 or 1893, and shortly afterward in San Luis Potosí, but these were not successful financially on account of the lack of suitable apparatus for the extraction of the rubber, and because of the absence of a market. About 1904, when much capital from the United States had been invested in the industry, it became of importance and large factories were established for the treatment of the plant. The raw plant rose to a price of \$75 per ton. In 1911 the outlay of North American capital alone in the industry was said to be \$30,000,000, and between July 1, 1905, and July 1, 1909, about 32,000,000 pounds of guayule rubber were imported into the United States, this being about 80 per cent of the total export. Later the industry declined, partly because of a failure in supply, but chiefly on account of the competition of East Indian rubber.

The following references may be mentioned here: F. Altamirano, Datos para la historia y explotación del "Guayule," Boletín de la Secretaría de Fomento de México II. 5: 1098-1123. 1906; Rómulo Escobar, El guayule y su propagación, Boletín de la Secretaría de Fomento 24. 1910; J. E. Kirkwood, Propagation of guayule by seeds, Amer. Rev. Trop. Agr. 1: 34-43. 1910; Kirkwood, The life-history of *Parthenium argentatum* (guayule), Amer. Rev. Trop. Agr. 1: 193-205. 1910.

2. *Parthenium parviceps* Blake, Contr. U. S. Nat. Herb. 22: 607. 1924.

Known only from the type locality, Barranca de Tenampá, Zacuapan, Veracruz.

Suffrutescent or frutescent; stem arachnoid-tomentose; leaf blades triangular-ovate, 5.5 to 9 cm. long, 3.5 to 6 cm. wide, acute, canescenscently arachnoid-tomentose beneath.

3. *Parthenium fruticosum* Less. in Schlecht. & Cham. *Linnaea* 5: 152. 1830. Chiapas and Veracruz (?); type from Plan del Río, Veracruz (?).

Apparently suffrutescent and tall; stem sordidly pilose-tomentose; leaf blades triangular-ovate, about 10 cm. long, 7.5 cm. wide, obtuse, truncate-rounded at base, green above, cinereous-tomentulose beneath, on narrowly margined petioles 1.5 cm. long.

4. *Parthenium schottii* Greenm. in Millsp. & Chase, Field Mus. Bot. 3: 109. 1904.

Yucatán; type from Progreso.

Shrub; stem tuberculate-hispidulous or tuberculate-pilose; leaf blades triangular-ovate, 5 to 9.5 cm. long, 2 to 5.5 cm. wide, acute or obtuse, repand, finely tuberculate above, beneath finely strigillose, hispidulous, or rarely rather densely puberulous, on margined petioles 1 to 2 cm. long; awns 2 or 3, short, erect or recurved. "Santa María," "chalcha."

5. *Parthenium tomentosum* DC. Prodr. 5: 532. 1836.

Puebla and Oaxaca; type collected between Oaxaca and Mitla.

Shrub 3 meters high; stem tomentose, glabrescent; leaf blades triangular-ovate, 2.5 to 10 cm. long, 1.6 to 6.5 cm. wide, cordate or subtruncate at base, green or cinereous above, cinereous-tomentulose and veiny beneath, on nearly marginless petioles 0.6 to 3 cm. long.

6. *Parthenium stramonium* Greene, Pittonia 4: 240. 1901.

Parthenium arctium Bartlett, Proc. Amer. Acad. 44: 635. 1909.

Sonora and Chihuahua; type from Chuichupa, Chihuahua.

Shrub about 3.5 meters high; stem cinereous-tomentulose, glabrescent; leaf blades triangular-ovate, 10 to 30 cm. long, 3 to 10 cm. wide, subcordate and usually unequal at base, weakly repand to crenulate, green or at first finely cinereous-tomentulose above, finely cinereous-tomentulose beneath.

7. *Parthenium incanum* H. B. K. Nov. Gen. & Sp. 4: 260. pl. 391. 1820.

Parthenium ramosissimum DC. Prodr. 5: 532. 1836.

Sonora to Coahuila, south to Hidalgo; type from Botanic Garden of Mexico. Texas to Arizona.

Low shrub; stem cinereous-tomentose, glabrescent; leaf blades 1.5 to 6 cm. long, usually cinereous but sometimes green above, cinereous-tomentulose beneath; pappus awns 2, divergent, about 1 mm. long. "Mariola" (the usual and most widely dispersed name); "hembra de guayule" (so called because it often grows with the true guayule); "tananiñ" (Querétaro); sometimes known erroneously as "guayule."

This plant furnishes rubber like that of guayule, but in smaller amounts. It has been employed extensively in Mexico for the extraction of commercial rubber, and was known also to the aboriginal inhabitants. Children sometimes chew the stems to obtain the rubber for making balls. In Coahuila the plant is reported to be used as a domestic remedy for affections of the liver.

8. *Parthenium lozanium* Bartlett, Proc. Amer. Acad. 44: 636. 1909.

Known only from the type locality, Hacienda El Carrizo, Sierra Madre, above Monterrey, Nuevo León.

About 2.5 meters high; leaf blades 4 to 9 cm. long, 2 to 4.5 cm. wide, deltoid-ovate, somewhat trilobate, coarsely repand-dentate with blunt teeth, usually with a pair of small lobes below base of blade.

42. IVA L. Sp. Pl. 988. 1753.

REFERENCE: Rydberg, N. Amer. Fl. 33: 4-7. 1922.

1. *Iva hayesiana* A. Gray, Proc. Amer. Acad. 11: 78. 1876.

Northern Baja California and Cedros Island. California; type from San Diego County, California.

Frutescent, under 1 meter high; branches erectish, strigillose and glandular; leaves opposite, oblong-obovate, elliptic-oblong, or spatulate, 5 cm. long or less, usually obtuse, entire, short-petioled, thick, triplinerved; heads small, disciform, nodding, yellowish, 3 to 6 mm. wide, in virgate racemes or racemiform panicles, bracted with small leaves; phyllaries few, obovate, obtuse, herbaceous, punctate; pistillate flowers with short tubulose corolla; hermaphrodite flowers sterile; anthers free, with inflexed appendages; achenes obovoid, obcompressed, epappose. 1.8 mm. long.

43. **HYMENOCLEA** Torr. & Gray, Mem. Amer. Acad. n. ser. 4: 79. 1849.

REFERENCE: Rydberg, N. Amer. Fl. 33: 13-15. 1922.

Slender much-branched shrubs; leaves alternate, linear-filiform, entire or pinately trisect; heads monoecious, glomerate-spicate, leafy-bracted; phyllaries of the staminate involucre few, united to middle; involucre of the pistillate heads gamophyllous, fusiform, beaked, inclosing a single flower, and bearing transverse, orbicular or obovate, scarious, spreading wings.

Wings of the fruit spirally arranged, suborbicular, the lower 6 to 8 mm. wide.

1. **H. salsola**.

Wings of the fruit in a single whorl, much narrower.

Wings 7 to 12; body of fruit about 4 mm. long-----2. **H. monogyra**.

Wings usually 5; body of fruit about 6 mm. long-----3. **H. pentalepis**.

1. **Hymenoclea salsola** Torr. & Gray, Mem. Amer. Acad. n. ser. 4: 79. 1849.

Northern Baja California and Sonora. Utah to Arizona and California; type from the Mohave River, California.

About 1 meter high; leaves few, mostly 3 cm. long or less; pistillate involucre in fruit about 6 mm. long.

2. **Hymenoclea monogyra** Torr. & Gray, Mem. Amer. Acad. n. ser. 4: 79. 1849.

Sonora, Sinaloa, Chihuahua, and Baja California. California to Texas; type from the Valley of the Gila.

Up to 4 meters high; leaves usually about 4 cm. long; wings of fruit narrowly obovate. "Romerillo" (Sinaloa).

A characteristic shrub of sandy arroyos, where it often forms dense thickets. It is employed locally as a remedy for pains in the abdomen.

3. **Hymenoclea pentalepis** Rydb. N. Amer. Fl. 33: 14. 1922.

Sonora and Baja California. Arizona and California; type from Pima Canyon, Arizona.

Similar to *H. monogyra*; fruit larger, with broadly obovate-flabelliform wings.

44. **FRANSERIA** Cav. Icon. Pl. 2: 78. pl. 200. 1793.

REFERENCE: Rydberg, N. Amer. Fl. 33: 22-37. 1922.

Herbs or shrubs, monoecious; leaves chiefly alternate; heads spicate, racemose, or paniculate, discoid; phyllaries of staminate involucres 1-seriate, united to middle; fertile involucres bur-like, 1 to 8-celled, 1 to 8-flowered, beaked, armed with 2 to many series of often hooked spines.

Leaves simply or doubly dentate, rarely 3 or 5-lobed.

Leaves coarsely spinose-toothed-----15. **F. ilicifolia**.

Leaves not spinose-toothed.

Leaves elongate-triangular, 3 to 5 times as long as wide; fruiting involucre densely covered with strongly hooked spines, these not flattened at base.

14. **F. ambrosioides**.

Leaves broader; spines of fruit flattened at base, usually not hooked.

Leaves doubly dentate or 3 or 5-lobed, green beneath (sometimes tomentose when young in *F. cordifolia*).

Leaves not trilobed to middle (except sometimes on sucker shoots), pubescent or puberulous beneath with more or less spreading hairs; spines and body of fruiting involucre densely stipitate-glandular-----7. **F. cordifolia**.

Leaves 3 or 5-lobed to middle, strigillose on both sides; spines of fruiting involucre sparsely pilosulous, obscurely glandular.

8. **F. divaricata**.

Leaves simply (rarely somewhat doubly) serrate or serrulate, densely whitish-tomentulose at least beneath.

Body of the fruiting involucre puberulous or pilose; leaf blades chiefly lanceolate or lance-ovate.....12. *F. deltoidea*.

Body of the fruiting involucre densely lanate-tomentulose; leaf blades chiefly deltoid-ovate or ovate.....13. *F. chenopodiifolia*.

Leaves sinuate-lobed to tripinnatifid.

Leaves green and sparsely strigillose to hispid beneath.

Spines of the fruiting involucre 1.5 to 3.5 cm. long.....1. *F. bryantii*.

Spines of the fruiting involucre 1 to 3.5 mm. long.

Leaves bipinnately lobed.

Spines of the fruit 6 to 9, not hooked, very short.....4. *F. hispida*.

Spines of the fruit numerous, hooked, about 3 mm. long.

6. *F. magdalenae*.

Leaves pinnately lobed or shallowly pinnatifid.

Leaves deeply lobed, with narrow divisions; fruit merely glandular.

2. *F. acuminata*.

Leaves shallowly lobed, with broad teeth or lobes; fruit densely pilose.

10. *F. sanctae-gertrudis*.

Leaves whitish or cinereous-pubescent or tomentulose beneath, at least when young.

Spines of the fruiting involucre few (about 4 to 16).

Leaves bipinnatifid or tripinnatifid.....3. *F. camphorata*.

Leaves pinnately lobed or deeply sinuate-toothed.

Leaf blades up to 15 cm. long, the lobes coarsely serrate.

9. *F. arborescens*.

Leaf blades 3 to 5 cm. long, the lobes spinulose-toothed.

11. *F. flexuosa*.

Spines of the fruiting involucre numerous.

Leaves small, 3 cm. long or less, 1 to 3-pinnatisect, the tips of the primary lobes rounded; spines of the fruiting involucre strongly flattened at base, not hooked.....5. *F. dumosa*.

Leaves usually 3 to 5 cm. long, the tips of the primary lobes usually acutish; spines subterete or somewhat grooved above at base, hooked.

6. *F. magdalenae*.

1. *Franseria bryantii* Curran, Proc. Calif. Acad. II. 1: 232. 1888.

Acanthambrosia bryantii Rydb. N. Amer. Fl. 33: 22. 1922.

Baja California; type from Magdalena Bay.

Shrub 30 to 90 cm. high, with white-barked branchlets; leaves 1 to 4 cm. long; pistillate involucres solitary or paired, long-persistent, appearing axillary; spines of the involucre wide-spreading, not hooked, in 1 or 2 series.

2. *Franseria acuminata* T. S. Brandeg. Proc. Calif. Acad. II. 2: 171. 1889.

Known only from the type locality, Purísima, Baja California.

Shrubby, about 60 cm. high, the branches brown, essentially glabrous; leaves 3.5 to 7.5 cm. long, long-acuminate; fruiting involucre "5 mm. long," with very short incurved spines.

3. *Franseria camphorata* Greene, Bull. Calif. Acad. 1: 192. 1885.

Northern Baja California and Guadalupe Island; type from Guadalupe Island.

Sufrutescent, tomentulose on the younger parts, camphory-resinous; primary lobes of the leaves lanceolate or triangular in outline, laciniately toothed to nearly bipinnatifid; fruiting involucres about 7 mm. long.

3a. *Franseria camphorata leptophylla* A. Gray, Proc. Amer. Acad. 22: 309. 1887.

Franseria leptophylla Rydb. N. Amer. Fl. **33**: 32. 1922.

Northern Baja California and Cedros Island; Sonora; type from San Fernando, Baja California.

Similar; leaves more deeply lobed, with finer divisions.

4. *Franseria hispida* Benth. Bot. Voy. Sulph. 25. 1844.

Gaertnera hispida Kuntze, Rev. Gen. Pl. 1: 339. 1891.

Known only from the type locality, Magdalena Bay, Baja California.

Low shrub; stem white-hispid; leaves bipinnatifid, 5 to 7 cm. long and wide, glandular and hispid; fruit 4 mm. long, the spines 6 to 9, subulate, 2-seriate. (Description compiled.)

5. *Franseria dumosa* A. Gray in Frém. Rep. Exped. Rocky Mount. 316. 1845.

Franseria albicaulis Torr. Pl. Frém. 16. 1853.

Franseria dumosa albicaulis A. Gray in Torr. U. S. & Mex. Bound. Bot. 87. 1859.

Gaertnera dumosa Kuntze, Rev. Gen. Pl. 1: 339. 1891.

Northern Baja California and Sonora. California to Utah and Arizona; type from the Mohave River.

Low shrub, white-barked, finely cinereous-tomentulose, including both sides of the leaves; fruiting involucre about 6 mm. long; spines strongly flattened toward base, not hooked.

6. *Franseria magdalenae* T. S. Brandeg. Proc. Calif. Acad. II. 2: 170. 1889.

Franseria intricata Rydb. N. Amer. Fl. **33**: 33. 1922.

Baja California; type from Magdalena Island.

Shrubby, about 60 cm. high, much branched; inflorescence usually branched; leaves green or cinereous above, once or twice pinnatifid; fruiting involucre about 6 mm. long, densely armed with spreading hooked spines.

7. *Franseria cordifolia* A. Gray, Syn. Fl. 1²: 445. 1884.

Gaertnera cordifolia Kuntze, Rev. Gen. Pl. 1: 339. 1891.

Franseria malvacea Rydb. N. Amer. Fl. **33**: 34. 1922.

Sonora, Sinaloa, and San Luis Potosí. Arizona; type from Tucson.

Slender, suffrutescent, puberulous; leaf blades deltoid-ovate, 2.5 to 8.5 cm. long, green above, pale beneath, doubly dentate, usually shallowly cordate at base, sometimes 3-lobed; fruiting involucre 5 to 6 mm. long, its spines hooked.

8. *Franseria divaricata* T. S. Brandeg. Proc. Calif. Acad. II. 2: 171. 1889.

Known only from the type locality, San Gregorio, Baja California.

Shrubby, divaricately much branched, 30 cm. high or more, cinereous-puberulous on the young growth; leaf blades suborbicular-ovate in outline, 2 to 2.5 cm. long, 3 or 5-lobed about to middle, with euneate-obovate doubly dentate lobes; fruiting involucre about 7 mm. long, the spines stout, about 2 mm. long, grooved but scarcely flattened at base.

9. *Franseria arborescens* T. S. Brandeg. Zoe 5: 162. 1903.

Franseria carduacea Greene, Leaflets 2: 156. 1911.

Baja California.

Arborescent, 3 to 5 meters high; stem hispidulous; leaves ovate in outline, 5 to 7-lobed about halfway to middle, the lobes broad, canescent-pilosulous beneath; fruiting involucre densely pubescent, with 7 or 8 stout hooked spines.

10. *Franseria sanctae-gertrudis* Rydb. N. Amer. Fl. **33**: 35. 1922.

Known only from the type locality, Santa Gertrudis, Baja California.

Shrub; leaves petioled, ovate to lance-ovate, 6 to 8 cm. long, 2.5 to 4 cm. wide, shallowly sinuate-lobed or toothed, green and hispidulous on both sides; fruit as in *F. arborescens*.

11. *Franseria flexuosa* A. Gray, Proc. Amer. Acad. 20: 298. 1885.
Northern Baja California; type from Cantillas Canyon.
Low shrub; leaves short-petioled, deltoid-lanceolate, coriaceous, sinuate-lobed or -toothed, acuminate, canescent-puberulent on both sides; fruit 7 mm. long, glandular and villous, the spines not hooked. (Description compiled.)
12. *Franseria deltoidea* Torr. Pl. Frém. 15. 1853.
Gaertnera deltoidea Kuntze, Rev. Gen. Pl. 1: 339. 1891.
Sonora. Arizona; type from the Gila River.
Low, shrubby, canescent-tomentulose; leaf blades 1 to 3.8 cm. long, slender-petioled, cuneate at base, venose beneath; fruiting involucre about 7 mm. long, its spines straight, flattened at base.
13. *Franseria chenopodiifolia* Benth. Bot. Voy. Sulph. 26. 1844.
Gaertnera chenopodiifolia Abrams, Bull. N. Y. Bot. Gard. 6: 461. 1910.
Franseria lancifolia Rydb. N. Amer. Fl. 33: 36. 1922.
Baja California and Cedros Island; type from Magdalena Bay. Southern California.
Suffrutescent, low, the branches cinereous-tomentulose, glabrate; leaf blades 2 to 3 cm. long, usually about as wide; spines of the fruiting involucre hook-tipped, usually strongly flattened at base.
Franseria lancifolia Rydb. is a form of this species with less pubescent fruits.
14. *Franseria ambrosioides* Cav. Icon. Pl. 2: 79. pl. 200. 1793.
Xanthidium ambrosioides Delpino, "Studi Lign. Anem. 63. 1871."
Gaertnera ambrosioides Kuntze, Rev. Gen. Pl. 1: 339. 1891.
Sonora, Sinaloa, Durango, and Baja California; type from Mexico, without definite locality. Arizona.
Suffrutescent, hirsute and glandular, about 1.5 meters high; leaf blades 8 to 18 cm. long, 1 to 4.5 cm. wide, acuminate, coarsely serrate-dentate, slender-petioled; fruiting involucre 1 to 1.2 cm. long, *Xanthium*-like. "Chicura" (Sinaloa, Baja California.)
15. *Franseria ilicifolia* A. Gray, Proc. Amer. Acad. 11: 77. 1876.
Gaertnera ilicifolia Kuntze, Rev. Gen. Pl. 1: 339. 1891.
Northern Baja California and islands; type from Cantillas Canyon. California and Arizona.
Shrubby, 30 to 60 cm. high, spreading-hirsute, densely leafy; leaves ovate or rhombic-ovate, 3 to 10 cm. long, 1.8 to 9.5 cm. wide, sessile, cordate-clasping, coriaceous; fruiting involucre 1.5 to 2.3 cm. long, densely covered with hooked spines, glandular-hairy.
45. **PHILACTIS** Schrad. "Ind. Sem. Hort. Goett. 1831;" *Linnaea* 8: Litt.-Ber. 24. 1833.
1. *Philactis zinnioides* Schrad. "Ind. Sem. Hort. Goett. 1831;" *Linnaea* 8: Litt.-Ber. 24. 1833.
Mexico, without definite locality.
Suffruticulose, dichotomous, the young branches villous; leaves opposite, petioled, broadly ovate, acuminate, serrulate, appressed-villous; peduncles in the forks, monocephalous, shorter than the leaves; involucre 2-seriate, appressed; receptacle elongate-conic; heads yellow; rays fertile, sessile, persistent, their achenes trigonous, glabrous, with an awn on the inner angle; disk flowers sterile, the achenes subtetragonous, with a pappus of 4 basally connate awns. (Description compiled.)
46. **ZINNIA** L. Syst. Nat. ed. 10. 1221. 1759.

REFERENCE: Robinson & Greenman, A revision of the genus *Zinnia*, Proc. Amer. Acad. 32: 14-20. 1896

Herbs or undershrubs with opposite entire leaves (in ours), and yellow, orange, white, or rarely liver-colored, usually solitary, terminal heads; involucre several-seriate, of strongly graduate, dry, subherbaceous-tipped phyllaries; rays fertile, the ligules sessile, persistent, the achenes awnless or with 1 to 3 short awns; disk fertile, the achenes strongly compressed, 2-toothed, 1 or 2-awned or awnless.

The cultivated zinnias or youth-and-old-age of the gardens are Mexican and South American species of this genus.

- Rays bright orange.....1. *Z. juniperifolia*.
 Rays white, yellow, or liver-colored.
 Rays much shorter than the involucre, sometimes wanting...2. *Z. anomala*.
 Rays longer than the involucre.
 Leaves triplinerved; ligules 8 to 16 mm. long.....3. *Z. grandiflora*.
 Leaves 1-nerved; ligules 12 mm. long or less.
 Body of disk achenes 3 to 3.5 mm. long.....4. *Z. acerosa*.
 Body of disk achenes 2 mm. long.....5. *Z. pumila*.

1. *Zinnia juniperifolia* (DC.) A. Gray, Pl. Wright. 1: 105. 1852.

Diplothrix juniperifolia DC. Prodr. 5: 612. 1836.

Crassina juniperifolia Kuntze, Rev. Gen. Pl. 1: 331. 1891.

Coahuila, Zacatecas, and San Luis Potosí; type from San Luis Potosí.

Suffruticulose, much branched, 30 cm. high or less, puberulous; leaves linear, 1.5 to 4 cm. long, 1 to 1.8 mm. wide, 3-nerved; peduncles usually elongate; heads 2 to 3.8 cm. wide.

2. *Zinnia anomala* A. Gray, Pl. Wright. 1: 106. 1852.

Crassina anomala Kuntze, Rev. Gen. Pl. 1: 331. 1891.

Coahuila and Zacatecas. Texas; type from prairies beyond the Pecos.

Suffruticulose, about 12 cm. high; leaves linear or linear-lanceolate, about 2 cm. long, 3-nerved; phyllaries densely ciliate; heads 1.5 cm. wide or less; ligules "yellow" (?), apparently liver-colored; disk deep orange.

3. *Zinnia grandiflora* Nutt. Trans. Amer. Phil. Soc. n. ser. 7: 348. 1840.

Crassina grandiflora Kuntze, Rev. Gen. Pl. 1: 331. 1891.

Sonora to Chihuahua and Durango. Colorado to Arizona and Texas; type from the Rocky Mountains.

Suffruticulose, much branched, 20 cm. high or less; leaves linear, 2.5 cm. long or less, 1 to 1.5 mm. wide; heads 2 to 3.2 cm. wide; rays bright yellow, very showy, suborbicular; disk orange.

4. *Zinnia acerosa* (DC.) A. Gray, Pl. Wright. 1: 106. 1852.

Diplothrix acerosa DC. Prodr. 5: 611. 1836.

Crassina acerosa Kuntze, Rev. Gen. Pl. 1: 331. 1891.

Coahuila and San Luis Potosí; type from San Luis Potosí. Texas.

Similar to *Z. grandiflora* but smaller; leaves 1 to 2.5 cm. long, 1 mm. wide or less; heads 1 to 2.5 cm. wide; rays pale yellow or white (?).

5. *Zinnia pumila* A. Gray, Mem. Amer. Acad. n. ser. 4: 81. 1849.

Crassina pumila Kuntze, Rev. Gen. Pl. 1: 331. 1891.

Sonora to Coahuila and San Luis Potosí; type from San Juan de la Vequería and Castaniola, Mexico. Texas to Arizona.

Similar to *Z. acerosa*; leaves shorter, 16 mm. long or less; heads 1.2 to 1.8 cm. wide; rays white or "pale yellow" (?); achenes smaller. "Hierba de burro" (Zacatecas.)

47. **SANVITALIA** Gualt. in Lam. "Journ. Nat. Hist. 2: 176. pl. 33. 1792."

1. *Sanvitalia fruticosa* Hemsl. Biol. Centr. Amer. Bot. 2: 155. 1881.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Suffruticulose, about 15 cm. high, much branched, cinereous-strigose throughout; leaves opposite, short-petioled, the blades lanceolate, 1 to 2.4 cm. long, 3 to 6 mm. wide, few-toothed or entire; heads solitary at tips of branches, 1.5 cm. wide, often leafy-bracted; rays yellow, sessile, persistent; disk purple-brown; ray achenes trigonous, stiffly 3-awned; disk achenes compressed, usually with crustaceous margins and 2 short awns.

48. **HELIOPSIS** Pers. Syn. Pl. 2: 473. 1807.

1. **Heliospis longipes** (A. Gray) Blake, Contr. U. S. Nat. Herb. 22: 608. 1924.
Philactis longipes A. Gray, Proc. Amer. Acad. 15: 35. 1879.
San Luis Potosí.

Suffrutescent, 30 to 50 cm. high, hirtellous; leaves opposite, remote, short-petioled, the blades ovate, about 2 cm. long, dentate-serrate; peduncles terminal, elongate, 1-headed; involucre 2-seriate, about 7 mm. high, of subherbaceous, ovate or lance-ovate phyllaries; receptacle columnar; flowers yellow; rays fertile, the lamina sessile, about 1 cm. long, the achenes trigonous-obcompressed, epappose; disk flowers fertile, quadrangular and few-ribbed, epappose or with 2 or 4 minute teeth.

49. **GRYPOCARPHA** Greenm. in Sarg. Trees & Shrubs 1: 145. pl. 73. 1903.

REFERENCE: Blake, Contr. Gray Herb. n. ser. 52: 34-36. 1917.

Shrubs with opposite triplinerved ovate leaves; heads yellow, radiate, solitary in the axils or in cymes of 3 or 5 at tips of branches; involucre 2 or 3-seriate, the phyllaries indurate, lance-ovate or oblong, with narrow, spreading or reflexed, herbaceous tips; pales stiff, acuminate, usually incurved-hooked at apex; ray corollas sessile, persistent; ray achenes trigonous, 1-awned; disk achenes fertile, quadrangular, with 1 or 2 awns and sometimes 1 or 2 very short squamellae.

The genus includes only the three following species.

Branchlets densely pubescent; involucre villous..... 1. **G. hebeclada**.

Branchlets very sparsely strigillose or glabrous; phyllaries ciliate, on back sparsely pubescent or subglabrous.

Veins of the leaves beneath spreading-pubescent..... 2. **G. liebmannii**.

Veins of the leaves beneath glabrous..... 3. **G. nelsonii**.

1. **Grypocarpa hebeclada** Blake, Contr. Gray Herb. n. ser. 52: 35. 1917.

Oaxaca; type from Tula.

Leaf blades ovate, 4 to 6.5 cm. long, strigose above, in youth densely pubescent beneath, on petioles 1 cm. long; heads 1.5 to 3 cm. wide.

2. **Grypocarpa liebmannii** (Klatt) Blake, Contr. Gray Herb. n. ser. 52: 35. 1917.

Zinnia liebmannii Klatt, Leopoldina 23: 89. 1887.

Sanvitaliopsis liebmannii Schultz Bip.; Klatt, Leopoldina 23: 89. 1887, as synonym.

Melanthera fruticosa T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 421. 1924.

Oaxaca (?) and Chiapas; type from Río Taba, Oaxaca (?). Guatemala.

Leaf blades ovate, 7.5 to 10.5 cm. long, acuminate, smooth above; heads 2 cm. wide.

3. **Grypocarpa nelsonii** Greenm. in Sarg. Trees & Shrubs 1: 145. pl. 73. 1903.

Sanvitaliopsis nelsonii Greenm. Proc. Amer. Acad. 41: 261. 1905.

Known only from the type locality, on ridge back of Tonalá, Chiapas.

Leaf blades ovate, 6 to 7 cm. long, glabrous on both sides; heads about 2.2 cm. wide.

50. *RUMFORDIA* DC. Prodr. 5: 549. 1836.

REFERENCE: Robinson, A revision of the genus *Rumfordia*, Proc. Amer. Acad. 44: 592-596. 1909.

Shrubs or herbs, with broad opposite leaves; heads yellow, radiate, several to very numerous in terminal cymose panicles; involucre double, the outer phyllaries herbaceous, loose, the inner much smaller, embracing the ray achenes; ray and disk fertile; achenes obovoid, thickened, epappose.

Leaves broadly ovate, regularly toothed, not lobed or angulate.

1. *R. floribunda*.

Leaves rhombic-ovate or triangular-ovate, coarsely 1 or 2-lobed or toothed on the angles.

Outer phyllaries granular-puberulous chiefly on margin; stem essentially glabrous.....2. *R. attenuata*.

Outer phyllaries glandular-pilose; stem crisped-pilosulous....3. *R. oreopola*.

1. *Rumfordia floribunda* DC. Prodr. 5: 550. 1836.

Rumfordia floribunda pubescens Greenm. Proc. Amer. Acad. 41: 261. 1905.

Tepec to Oaxaca; type from Mexico, without definite locality.

Shrubby below, 2 to 4 meters high; leaf blades 8 to 19 cm. long, decurrent on the petioles nearly or usually quite to the base, usually pilose beneath in the axils of the main veins and along costa; panicle 10 to 22 cm. wide, very many-headed; heads 1.8 to 3.5 cm. wide; ray corollas provided with a slender tube, persistent, yellow becoming white. "Tacote amarillo" (Tepec).

2. *Rumfordia attenuata* Robinson, Proc. Amer. Acad. 44: 594. 1909.

Known only from the type locality, Sierra Madre of Michoacán or Guerrero.

Suffrutescent (?), 2.5 meters high; leaves rhombic-ovate, or the upper lanceolate, the larger 23 cm. long, 12 cm. wide, thin, acuminate, bearing one or two large spreading teeth on each angle, narrowed to a subsessile base or short-petioled; phyllaries 8 to 10 mm. long.

3. *Rumfordia oreopola* Robinson, Proc. Amer. Acad. 44: 595. 1909.

Known only from the type locality, crest of the Sierra Madre, Michoacán or Guerrero.

Suffrutescent (?), 3 meters high; leaves triangular-ovate, about 10 cm. long, 6 cm. wide, short-petioled, coarsely about 2-toothed on each side and serrulate; phyllaries 1.1 to 1.9 cm. long.

51. *RHYSOLEPIS* Blake, Contr. Gray Herb. n. ser. 52: 36. 1917.

REFERENCE: Blake, Contr. Gray Herb. n. ser. 52: 36-37. 1917.

Suffrutescent; leaves opposite or alternate, serrate; heads radiate, yellow, few in terminal cymose panicles; involucre 3 or 4-seriate, graduate, of herbaceous-tipped phyllaries; rays neutral; pales indurate, gibbous, cross-wrinkled, closely embracing the disk achenes; disk achenes strongly compressed; pappus of 2 awns and 6 to 8 minute squamellae.

Only the two species following are known.

Leaves chiefly alternate, oblong or ovate-oblong, subsessile...1. *R. morelensis*.
Leaves opposite, ovate-lanceolate, on petioles 3 to 13 mm. long. 2. *R. palmeri*.

1. *Rhysolepis morelensis* (Greenm.) Blake, Contr. Gray Herb. n. ser. 52: 36. 1917.

Viguiera morelensis Greenm. Proc. Amer. Acad. 40: 40. 1904.

Morelos; type from Cuernavaca.

Leaf blades 4 to 6.8 cm. long, 0.8 to 2 cm. wide; involucre 7 mm. high, the two outer rows of phyllaries strongly reflexed, the two inner with only the tips reflexed.

2. *Rhyssolepis palmeri* (A. Gray) Blake, Contr. Gray Herb. n. ser. 52: 37. 1917.

Viguiera palmeri A. Gray in S. Wats. Proc. Amer. Acad. 22: 427. 1887.

Jalisco; type from Río Blanco.

Leaf blades 4 to 10.5 cm. long, 1.3 to 3 cm. wide; phyllaries all squarrose-tipped, the outer with lance-linear foliaceous tips up to 2.5 cm. long.

52. MONTANOA Cervant. in Llave & Lex. Nov. Veg. Deser. 2: 11. 1825.

REFERENCE: Robinson & Greenman, Proc. Amer. Acad. 34: 508-521. 1899.

Shrubs or trees; leaves chiefly opposite, usually ovate, sometimes lobed or coarsely pinnatifid; heads white, radiate, rarely discoid, usually numerous; outer phyllaries about 5 to 7, usually linear to oblong; rays neutral; pales in fruit accrescent, usually scarious, often spinescent-tipped, including and greatly surpassing the obovoid, thickened, epappose achenes.

The genus was named by Cervantes in honor of Don Luis Montaña, native of Puebla, a distinguished physician and naturalist.

The name "cerbatana" is reported for some unidentified species of the genus. In Central America this same name is sometimes applied to species of *Verbesina* because of the fact that the hollow stems are employed by boys for making popguns (cerbatanas).

Rays none; heads 3 or 4-flowered.

Leaves suborbicular, rusty-tomentose beneath.....1. *M. hemsleyana*.

Leaves elliptic-lanceolate to oval-ovate, quickly glabrate beneath...2. *M. rekoii*.

Rays present; heads with more numerous flowers.

Heads very large, 4.5 to 8 cm. wide; leaves deeply pinnatifid.

Petioles broadly winged to the very base.....29. *M. grandiflora*.

Petioles incompletely or not at all winged.

Leaves permanently canescent-tomentose beneath.....30. *M. speciosa*.

Leaves soon green and merely puberulent beneath...31. *M. pyramidata*.

Heads smaller, 4.5 (rarely 5) cm. wide or less; leaves often merely serrate.

Heads very small, 16 mm. wide or less, the rays 2 to 5; pales densely silky-villous.

Leaves truncate or subcordate at base.

Leaves deltoid-ovate, about as wide as long.....3. *M. floribunda*.

Leaves triangular-ovate, much longer than wide....4. *M. tomentosa*.

Leaves cuneate to acute at base.

Leaves distinctly 3 or 5-lobed.

Phyllaries in anthesis 5 to 6 mm. long.....9. *M. palmeri*.

Phyllaries in anthesis 3 to 4 mm. long.

Leaves about one-half as wide as long.....7. *M. myriocephala*.

Leaves about three-fourths as wide as long...8. *M. xanthiifolia*.

Leaves unlobed.

Phyllaries at anthesis 2.5 to 4 mm. long.

Leaves 2 to 7 cm. wide, on petioles 1 cm. long...5. *M. seleriana*.

Leaves 1.8 to 2 cm. wide, on winged petioles...6. *M. microcephala*.

Phyllaries at anthesis 4.5 to 6 mm. long.

Larger leaves rhombic-ovate, 7 to 8 cm. wide....9. *M. palmeri*.

Larger leaves ovate, 2 to 5 cm. wide.....10. *M. rosei*.

Heads medium-sized, the rays 7 to 10; pales from rather densely villous to nearly glabrous, not silky.

Phyllaries about 10 mm. long.

Phyllaries spatulate-obovate.....11. *M. pringlei*.

- Phyllaries broadly oblong-----12. *M. liebmannii*.
 Phyllaries smaller, 3 to 7 mm. long.
 Leaves very large, 10 to 30 cm. wide, deeply palmate-lobed, on wingless
 petioles-----15. *M. hibiscifolia*.
 Leaves much smaller, or else merely angulate-lobed.
 Leaves oblong or elliptic-oblong, the petioles short, naked or winged.
 13. *M. samalensis*.
 Leaves mostly ovate or lance-ovate.
 Petioles short, winged throughout-----14. *M. tehucana*.
 Petioles usually rather long, winged only at apex if at all.
 Pales in fruit stiff and firm, gradually long-acuminate into a
 stout spinescent tip.
 Leaves essentially glabrous beneath except along the veins.
 17. *M. frutescens*.
 Leaves hirtellous beneath-----18. *M. arborescens*.
 Pales in fruit thin, subscariosus, varying from abruptly mucronate
 to short-acuminate.
 Pales in fruit rather densely long-pilose, especially on margin.
 23. *M. pilosipalea*.
 Pales in fruit subglabrous or sparsely pubescent.
 Plants scandent.
 Leaves broadly ovate or deltoid-ovate, rounded or
 truncate to subcordate at base.
 Leaves puberulous beneath-----26. *M. pauciflora*.
 Leaves sordid-tomentulose beneath---27. *M. schottii*.
 Leaves lance-ovate, cuneate at base---28. *M. gracilis*.
 Plants not scandent.
 Leaves hexagonal-ovate, about 14 cm. long and nearly as
 wide, long-petioled, arachnoid-tomentose beneath;
 branchlets strongly quadrangular.
 16. *M. hexagona*.
 Leaves usually much longer than wide, not arachnoid-
 tomentose beneath; branchlets not strongly quad-
 rangular.
 Pales in fruit retuse and short-mucronate.
 Leaves pubescent beneath on all the veins and
 veinlets-----24. *M. subtruncata*.
 Leaves sparsely puberulous beneath on the chief
 veins-----25. *M. affinis*.
 Pales in fruit rather gradually or abruptly cuspidate or
 mucronate, not retuse.
 Pales in fruit with straightish tips.
 Leaves rhombic-ovate or triangular-ovate, shortly
 cuneate at base-----19. *M. purpurascens*.
 Leaves lanceolate to lance-obovate, truncate at
 base-----20. *M. arsenei*.
 Pales in fruit with uncinaterecurved tips.
 Leaves lanceolate to ovate, obscurely or not at all
 angulate-lobed-----21. *M. uncinata*.
 Leaves usually rhombic-ovate, distinctly angulate-
 lobed-----22. *M. patens*.

1. *Montanoa hemsleyana* (Kuntze) Blake.

Montanoa sp. (no. 24) Hemsl. Biol. Centr. Amer. Bot. 2: 166. 1881.

Eriocoma hemsleyana Kuntze, Rev. Gen. Pl. 1: 336. 1891.

Montanoa anomala Robins. & Greenm. Proc. Amer. Acad. **34**: 509. 1899.

Known only from the type locality, Valley of Córdoba, Veraacruz.

Leaves petioled, the blades of the uppermost 4 cm. long, 5 cm. wide, unlobed; panicle 18 cm. wide; phyllaries linear or linear-lanceolate. (Description compiled.)

2. *Montanoa rekoii* Blake, Contr. U. S. Nat. Herb. **22**: 610. 1924.

Known only from the type locality, Apango, Oaxaca.

Large tree, the trunk up to 50 cm. thick, the bark cork-like; leaf blades 8.5 to 19 cm. long, 2.3 to 9.5 cm. wide, unlobed or sometimes 3-lobed; disk 5 mm. high, 2.5 mm. thick; phyllaries ovate. "Yagazeche," "ocotillo."

The branches contain a rosin or camphor-like substance which burns like pitch.

3. *Montanoa floribunda* (H. B. K.) Schultz Bip.; C. Koch, Wochenschr. Gärtn. **7**: 406. 1864.

Eriocoma floribunda H. B. K. Nov. Gen. & Sp. **4**: 268. pl. 396. 1820.

Montagnaea floribunda DC. Prodr. **5**: 564. 1836.

State of Mexico to Oaxaca; type collected between Guadalupe and City of Mexico.

Shrub, up to 2.5 meters high; branches sordidly pilose-tomentose, glabrescent; leaves slender-petioled, the blades 2.5 to 6.5 cm. long and wide, crenate-dentate, scabrous above, sordid-tomentose beneath; heads very numerous, cymose-panicked. "Cihuapatli," "zuapatli," "zoapatle," "zoapatli."

4. *Montanoa tomentosa* Cervant. in Llave & Lex. Nov. Veg. Descrip. **2**: 11. 1825.

Eriocoma fragrans D. Don in Sweet, Brit. Fl. Gard. II. **1**: pl. 44. 1830.

Eriocoma heterophylla Schrad. "Ind. Sem. Hort. Gott. **1833**: 3. 1833;"

Linnæa **10**: Litt.-Ber. 70. 1835.

Montagnaea tomentosa DC. Prodr. **5**: 564. 1836.

Montagnaea tomentosa cordifolia DC. Prodr. **5**: 565. 1836.

Montagnaea tomentosa ternifolia DC. Prodr. **5**: 565. 1836.

Montanoa ternifolia Schultz Bip.; C. Koch, Wochenschr. Gärtn. **7**: 406. 1864.

Eriocoma tomentosa Kuntze, Rev. Gen. Pl. **1**: 336. 1891.

Eriocoma ternifolia Kuntze, Rev. Gen. Pl. **1**: 336. 1891.

Montanoa tomentosa ternifolia Hemsl. (Biol. Centr. Amer. Bot. **2**: 166. 1881, as synonym); Robins. & Greenm. Proc. Amer. Acad. **34**: 510. 1899.

San Luis Potosí to Oaxaca; type from State of Mexico.

Similar to *M. floribunda*; leaf blades 3.5 to 11 cm. long, 2 to 8.5 cm. wide, often coarsely lobed especially toward base. "Cihuapatli," "ciguapacle" (from the Nahuatl *cihua-patli*, woman + medicine); "singuapacle," "zuapatli," "zoapatle," "zihoapactli," "sinhuapastle," "zihuapatli," "zoapatle," "cihoapactli," "hierba de la parida" (Distrito Federal).

The plant is reputed to have stomachic, diuretic, and pectoral properties. Its most common use, however, is as an aid to women in childbirth, the decoction being administered to provoke uterine contractions, although such use is said to be dangerous. It is said to be much used for this purpose in Mexico at the present time. See E. Armendáriz, Estudio químico del zoapatli, Anal. Inst. Méd. Nac. Méx. **1**: 11.

It is doubtless this or a related species of which Sahagún writes as follows: "There is a medicinal plant called *cihuapatli*. It is a shrub from which spring many long branches with ashen, pointed leaves. The flowers are yellow and white. The seed resembles that of blite. The decoction of the leaves is the part used. Pregnant women drink it at the time of delivery to facilitate labor and to prevent consequent exhaustion. The numerous roots of this shrub are fine and long, black outside and yellow within. Ground and mixed with lukewarm water,

they are good for those who suffer from dysentery. The infusion may be taken on an empty stomach or after meals. Those who make use of it should be careful of their diet. This plant grows in the fields, on the mountains, or even in the patios of the houses."

5. *Montanoa seleriana* Robins. & Greenm. Proc. Amer. Acad. 34: 510. 1899.
Known only from the type locality, Tuxtla, Chiapas.

Leaves rhombic-ovate or lanceolate, 5 to 10 cm. long, cuneate at base, serrulate or subentire, scabrous above, tomentose beneath, at length subglabrate; panicles 10 cm. wide. (Description compiled.)

6. *Montanoa microcephala* Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 406. 1864.

Eriocoma microcephala Kuntze, Rev. Gen. Pl. 1: 336. 1891.

Known only from the type locality, Ejutla, Oaxaca.

Rusty-tomentose; leaves elliptic-lanceolate, 6 cm. long, acute at each end, serrate, scabrous above, densely tomentose beneath; heads very small and numerous. (Description compiled.)

7. *Montanoa myriocephala* Robins. & Greenm. Proc. Amer. Acad. 34: 511. 1899.

Jalisco and Puebla to Chiapas; type from Chapala, Jalisco.

Branches sordidly pilose-tomentose, glabrate; leaf blades rhombic-ovate in outline, 7 to 13 cm. long, 3 to 8 cm. wide, 3 or 5-lobed with short blunt lateral lobes, cuneately decurrent on the upper part of the petiole, scabrous above, more or less tomentose beneath; heads numerous.

8. *Montanoa xanthiifolia* Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 406. 1864.

Eriocoma xanthiifolia Kuntze, Rev. Gen. Pl. 1: 336. 1891.

"Chacalepa Estate, Mexico" (type locality). Costa Rica.

Similar to *M. myriocephala*; leaf blades 3-lobed, 12 cm. long, 9 cm. wide, cuneately narrowed into the rusty-tomentose petiole, very scabrous above, the lobes ovate or triangular, acute to caudate-acuminate. (Description compiled.)

9. *Montanoa palmeri* Fernald, Proc. Amer. Acad. 33: 93. 1897.

Known only from the type locality, Acapulco, Guerrero.

Shrub 2.5 meters high, soon glabrate; leaf blades rhombic-ovate, 10 to 14 cm. long, 7 to 8 cm. wide, the larger angulate-lobed near middle, caudate-acuminate, crenulate, rough above, pubescent beneath; flowers with fragrance suggesting that of apple blossoms.

10. *Montanoa rosei* Robins. & Greenm. Proc. Amer. Acad. 32: 45. 1896.

Known only from the vicinity of the type locality, Alamos, Sonora.

Similar to *M. palmeri*; leaf blades ovate or lance-ovate, 7 to 10 cm. long, 2 to 5 cm. wide, unlobed, serrate, rough and bullate above, pubescent and gland-dotted beneath; heads very silky.

11. *Montanoa pringlei* Robins. & Greenm. Proc. Amer. Acad. 34: 512. 1899.

Known only from the type locality, Tehuacán, Puebla.

Branchlets pulverulent-tomentose; leaves lanceolate or oblong-lanceolate, 4 to 8 cm. long, 1.5 to 3 cm. wide, acute, serrate, gradually narrowed into wings decurrent nearly to base of petiole, green and scabrous above, canescent-tomentose beneath; heads 2 or 3 at ends of branches; rays 6 to 8 mm. long; pales (in anthesis) attenuate, villous. (Description compiled.)

12. *Montanoa liebmannii* (Schultz Bip.) Blake, Contr. Gray Herb. n. ser. 52: 37. 1917.

Polymnia liebmannii Schultz Bip.; Klatt, Leopoldina 23: 89. 1887.

Montanoa macrolepis Robins. & Greenm. Proc. Amer. Acad. 32: 44. 1896.

Oaxaca; type from Cumbre de Estepe.

Stem hirsute-pilose, glabrescent; leaf blades rhombic-ovate, 6 to 12.5 cm. long, 3.5 to 7.5 cm. wide, sinuately 3 or 5-lobed, decurrent on the upper part of the petiole, rough above, green and pubescent beneath; heads 1 to 5 at ends of branches; phyllaries acute to rounded, 3.5 to 5 mm. wide; pales elongate, attenuate, straightish, pungent-tipped.

13. *Montanoa samalensis* Coult. Bot. Gaz. **20**: 49. 1895.

Zacatecas. Guatemala; type from Río Samalá, Guatemala.

Branches sordid-tomentose, glabrescent; leaves 8 to 24 cm. long, a third as wide, obtuse or acuminate, crenate, green and scabrous above, beneath at first canescent-tomentose, at length glabrate and green; heads solitary or few; pales truncate, spinescent-mucronate.

14. *Montanoa tehuacana* Robinson, Proc. Amer. Acad. **47**: 209. 1911.

Puebla; type from Tehuacán.

Shrub, up to 5 meters high; leaf blades lance-ovate to rhombic-ovate, 4.5 to 20 cm. long, 2.5 to 16 cm. wide, cuneately decurrent on the petiole (sometimes broadly so), often sinuately 3 or 5-lobed, green and scabrous above, canescent-tomentulose beneath; heads rather few or numerous; pales rather abruptly contracted into long, spreading, spinescent tips.

15. *Montanoa hibiscifolia* (Benth.) Schultz Bip.; C. Koch, Wochenschr. Gärtn. **7**: 407. 1864.

Montagnaea hibiscifolia Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. **1852**: 89. 1852.

Eriocoma hibiscifolia Kuntze, Rev. Gen. Pl. **1**: 336. 1891.

• Chiapas. Guatemala to Costa Rica; type from Segovia, Nicaragua.

Shrub, up to 6.5 meters high; branches glabrescent; petioles long, often biauriculate at apex; leaves sinuately several-lobed usually to middle or deeper, canescent-tomentulose to merely puberulous beneath; heads numerous, cymose-panicle, 2 to 3.5 cm. wide; rays white "with roseate tinge"; pales in fruit short-mucronate from a subtruncate or emarginate apex. "Telecate blanco" (Nicaragua); "palo de marimba" (El Salvador).

16. *Montanoa hexagona* Robins. & Greenm. Proc. Amer. Acad. **34**: 514. 1899. Known only from the type locality, Chiapas.

Large tree; leaves scabrous above, unappendaged at base; petioles wingless, 7 cm. long; heads numerous, rather large; rays about 2 cm. long. (Description compiled.)

17. *Montanoa frutescens* (Mairet) Hemsl. Biol. Centr. Amer. Bot. **2**: 165. 1881.

Montagnaea frutescens Mairet; DC. Prodr. **5**: 565. 1836.

Priestleya squarrosa Moc. & Sessé; DC. Prodr. **5**: 565. 1836, as synonym.

Eriocoma frutescens Alamán; DC. Prodr. **5**: 565. 1836, as synonym.

Aldama montanoa Schultz Bip.; C. Koch, Wochenschr. Gärtn. **7**: 406. 1864. Michoacán to Oaxaca; type from Mexico, without definite locality.

Shrub, up to 4 meters high; stem glabrous or early glabrate; leaf blades ovate to deltoid- or rhombic-ovate, 6 to 15.5 cm. long, 2.5 to 11 cm. wide, rarely sinuately 3-lobed, acuminate, green on both sides, harsh above; heads few or numerous, up to 4.5 cm. wide.

18. *Montanoa arborescens* (DC.) Schultz Bip.; C. Koch, Wochenschr. Gärtn. **7**: 406. 1864.

Montagnaea arborescens DC. Prodr. **5**: 565. 1836.

Eriocoma arborescens Alamán; DC. Prodr. **5**: 566. 1836, as synonym.

Montanoa floribunda Cerv.; DC. Prodr. **5**: 566. 1836, as synonym.

Mexico, without definite locality (type); "Cordillera Guchilaqua."

Branches villous; leaves oblong-lanceolate, acuminate, acute at base, serrate near middle, harsh above; heads loosely cymose, long-pedicelcd; phyllaries oblong, nearly equaling the disk. (Description compiled.)

The name "tacote de flor" has been reported for the species.

19. *Montanoa purpurascens* Robins. & Greenm. Proc. Amer. Acad. 34: 515. 1899.

Eriocoma hartwegiana Kuntze, Rev. Gen. Pl. 1: 336. 1891, nomen nudum.

Zacatecas to Guanajuato; type locality not definitely stated.

Stem sordid-tomentose; leaf blades triangular-ovate or rhombic-ovate, 6 to 12.5 cm. long, 2 to 8 cm. wide, attenuate, cuneate at base, crenate-serrate, harsh above, sordid-tomentose or tomentulose beneath; heads numerous; fruiting pales broad, rather abruptly pungent-pointed.

20. *Montanoa arsenei* Blake, Contr. U. S. Nat. Herb. 22: 611. 1924.

Known only from the type locality, near Morelia, Michoacán.

Stem sordidly subtomentose-pubescent; leaf blades 6 to 12 cm. long, 1.5 to 4 cm. wide, acuminate, at base often very unequal, harsh above, rather densely hispidulous-pilosulous beneath; heads numerous, about 2 cm. wide; pales in fruit rather gradually narrowed to the spreading or reflexed cuspidate tip.

21. *Montanoa uncinata* Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 406. 1864.

Eriocoma uncinata Kuntze, Rev. Gen. Pl. 1: 336. 1891.

Michoacán to Oaxaca; type from "Cumbre de Estepa."

Shrub, up to 4 meters high; branches soon glabrate or glabrescent; leaf blades lance-ovate to rhombic-ovate, 6 to 12 cm. long, 2 to 6.5 cm. wide, caudate-acuminate, cuneate or rounded at base, griseous-tomentose or tomentulose beneath; heads numerous, about 2 cm. wide; pales broad, with short abrupt spinescent tips.

22. *Montanoa patens* A. Gray, Proc. Amer. Acad. 21: 388. 1886.

Sonora and Chihuahua to Jalisco and Puebla; type from Batopilas, Chihuahua.

Shrub, up to 4 meters high; branches puberulent; leaf blades 9 to 25 cm. long, 4 to 18 cm. wide, acuminate or attenuate, short-cuneate and often biauriculate at base, green and scabrous above, paler and puberulent-tomentulose beneath; heads numerous, about 2.5 cm. wide; pales broad, abruptly and shortly uncinately-cuspidate.

23. *Montanoa pilosipalea* Blake, Contr. U. S. Nat. Herb. 22: 612. 1924.

Known only from the type locality, Fort de La Guadalupe, near City of Puebla.

Stem sordidly pilose-tomentose; leaf blades triangular-ovate, 3.5 to 7 cm. long, 1.3 to 4 cm. wide, subentire or usually coarsely 1 or 2-toothed or lobed on each side near base, acuminate, short-cuneate at base, griseous-tomentose beneath; heads numerous; rays 7 mm. long; fruiting pales loosely long-pilose and densely pilose-ciliate above, abruptly contracted into a firm, spreading or slightly recurved cusp 1.5 to 1.8 mm. long.

24. *Montanoa subtruncata* A. Gray in S. Wats. Proc. Amer. Acad. 22: 424. 1887.

Jalisco; type from Río Blanco.

Shrub, up to 4 meters high; stem somewhat puberulous; leaves slender-petioled, the blades ovate or rhombic-ovate, 4.5 to 12 cm. long, 3 to 8 cm. wide, acuminate, at base truncate-rounded to broadly subcordate, not auriculate, sometimes sinuately 3 or 5-lobed, scabrous above, green beneath; heads numerous, 2.5 to 3.8 cm. wide; fruiting pales broad, abruptly mucronulate at the retuse apex.

25. *Montanoa affinis* Blake, Contr. U. S. Nat. Herb. 22: 612. 1924.

Known only from the type locality, El Ocote, Michoacán or Guerrero.

Shrub, 3 meters high; stem sparsely strigillose; petioles slender, 1.5 to 4.5 cm.

long; blades broadly ovate or suborbicular-ovate, 7 to 11 cm. long, 4.5 to 8 cm. wide, acute or short-acuminate, cuneate to subtruncate at base, sometimes with a short blunt lobe on each side near middle, remotely crenate, harsh above; heads numerous, 1.7 to 2 cm. wide; immature pales truncate-rounded and abruptly contracted into a short erect cusp. "Flor de San Francisco."

26. *Montanoa pauciflora* Klatt, *Leopoldina* 23: 90. 1887.

Coreopsis trilobata Vahl; Klatt, *Leopoldina* 23: 90. 1887, as synonym.

Oaxaca. Guatemala, Honduras, and El Salvador; type locality erroneously given as South America.

Scandent, suffrutescent; stem puberulent; petioles slender; leaf blades ovate, 5 to 9 cm. long, 3 to 6.8 cm. wide, acute or acuminate, sometimes shallowly and acutely 3-lobed, scabrous above; heads usually rather numerous, 2.5 to 3 cm. wide; fruiting pales retuse and short-mucronate. "Margarita," "palo de marimba," "tatascamite blanco" (El Salvador).

27. *Montanoa schottii* Robins. & Greenm. *Proc. Amer. Acad.* 34: 518. 1899.

Yucatán and Campeche (?); type collected between Mérida and Sisal, Yucatán.

Similar to *M. pauciflora*; leaves not lobed; branches of inflorescence sordid-tomentose; phyllaries acute; heads 4.5 to 5 cm. wide; fruiting pales retuse and mucronulate. "Homahak" (Maya, Yucatán).

28. *Montanoa gracilis* Schultz Bip.; C. Koch, *Wochenschr. Gärtn.* 7: 407. 1864.

Eriocoma gracilis Kuntze, *Rev. Gen. Pl.* 1: 336. 1891.

Known only from the type locality, "San Miguel, La Grabra," Mexico.

Similar to *M. pauciflora*; leaves ovate-lanceolate, 5 cm. long, 2.5 cm. wide, cuneate at base, very rough above, essentially glabrous beneath except along the nerves; rays 5; pales with straight mucro. (Description compiled.)

29. *Montanoa grandiflora* (DC.) Schultz Bip.; C. Koch, *Wochenschr. Gärtn.* 7: 408. 1864.

Montagnaea grandiflora DC. *Prodr.* 5: 565. 1836.

Eriocoma grandiflora Alamán; DC. *Prodr.* 5: 565. 1836, as synonym.

?*Priestleya longifolia* Moc. & Sessé; DC. *Prodr.* 5: 565. 1836, as synonym.

Durango to Oaxaca; type from Mexico, without definite locality.

Shrubby, up to 4 meters high; stem stout, sordidly subtomentose; leaves up to 30 cm. long (including the broadly margined petiole), pinnatifid with 3 to 9 unequal lobes, usually acuminate, green and rough above, canescent-tomentulose or subglabrescent beneath; heads numerous, 4.5 to 6.5 cm. wide; fruiting pales gradually spinescent-acuminate. "Paracua" (Michoacán, *Seler*).

30. *Montanoa speciosa* (DC.) Schultz Bip.; C. Koch, *Wochenschr. Gärtn.* 7: 408. 1864.

Montagnaea speciosa DC. *Prodr.* 5: 565. 1836.

Eriocoma speciosa Kuntze, *Rev. Gen. Pl.* 1: 336. 1891.

Known only from the type locality, Cuernavaca, Morelos.

Leaves about 22 cm. long, 7.5 cm. wide, irregularly pinnatifid, decurrent on the petiole, villous above, softly villous-tomentose beneath; pales subulate-spinescent at apex. (Description compiled.)

31. *Montanoa pyramidata* Schultz Bip.; C. Koch, *Wochenschr. Gärtn.* 7: 408. 1864.

Eriocoma pyramidata Kuntze, *Rev. Gen. Pl.* 1: 336. 1891.

Jalisco, Colima, and Morelos; type from Guadalajara, Jalisco.

Similar to *M. speciosa*; leaves soon green and merely puberulent beneath; fruiting pales gradually or rather abruptly narrowed into the straight cusp. "Tacote" (Sinaloa).

DOUBTFUL SPECIES.

MONTANOA ASCHENBORNII Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 407. 1864. *Eriocoma aschenbornii* Kuntze, Rev. Gen. Pl. 1: 336. 1891.

MONTANOA BIPINNATIFIDA (Kunth) C. Koch, Wochenschr. Gärtn. 7: 407. 1864. *Uhdea bipinnatifida* Kunth, "Ind. Sem. Hort. Berol. 1847: 13. 1847." Closely allied to *M. pyramidata* Schultz Bip., and perhaps identical.

MONTANOA CRENATA Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 407. 1864. *Eriocoma crenata* Kuntze, Rev. Gen. Pl. 1: 336. 1891.

MONTANOA ELEGANS C. Koch, Wochenschr. Gärtn. 7: 408. 1864. *Eriocoma elegans* Kuntze, Rev. Gen. Pl. 1: 336. 1891. Apparently closely related to *M. pyramidata* Schultz Bip., if not identical with that species.

MONTANOA KARVINSKII (DC.) Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 407. 1864, as *M. karwinskyi*. *Montagnaea karwinskii* DC. Prodr. 5: 565. 1836; *Montagnaea clematidea* Walp. Linnaea 14: 308. 1840; *Montanoa clematidea* Hemsl. Biol. Centr. Amer. Bot. 2: 165. 1881; *Eriocoma clematidea* Kuntze, Rev. Gen. Pl. 1: 336. 1891; *Eriocoma karwinskyi* Kuntze, Rev. Gen. Pl. 1: 336. 1891.

MONTANOA OLIVAE Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 406. 1864. *Eriocoma olivae* Kuntze, Rev. Gen. Pl. 1: 336. 1891.

MONTANOA TRILOBA Schultz Bip.; C. Koch, Wochenschr. Gärtn. 7: 406. 1864. *Eriocoma triloba* Kuntze, Rev. Gen. Pl. 1: 336. 1891.

53. VARILLA A. Gray, Mem. Amer. Acad. n. ser. 4: 106. 1849.

REFERENCE: A. Gray, Syn. Fl. 1²: 257. 1884.

Shrubby, low, glabrous; leaves linear, entire, opposite or alternate; heads discoid, yellow, solitary or cymose-panicled; involucre about 2-seriate, of lanceolate, indurate, vittate, appressed phyllaries; achenes subcylindric, 10 to 15-ribbed; pappus none or of about 10 weak bristle-like awns.

Only two species of this genus are known.

Heads cymose-panicled; leaves opposite, acuminate, not fleshy. 1. *V. mexicana*.

Heads solitary, long-peduncled; leaves chiefly alternate, obtuse, fleshy.

2. *V. texana*.

1. *Varilla mexicana* A. Gray, Mem. Amer. Acad. n. ser. 4: 106. 1849.

Coahuila and Chihuahua; type collected between Pelayo and Cadena, Chihuahua.

Low shrub, about 1.5 meters high, somewhat glutinous, oppositely branched; leaves linear-attenuate, 3 to 8.5 cm. long, 1.5 to 3 mm. wide; achenes about 10-ribbed, 2.5 mm. long; pappus of about 10 short, weak, often sparsely branched, bristle-like, persistent awns. "Varilla" (Coahuila); "jarilla."

2. *Varilla texana* A. Gray, Pl. Wright. 1: 123. 1852.

Northern Mexico (according to Gray). Texas; type collected between the Nueces River and the Rio Grande.

Frutescent, tufted, about 30 cm. high; leaves 1.5 to 3.3 cm. long, 1 to 2 mm. wide; peduncles 6 to 15 cm. long; achenes about 15-ribbed, epappose.

54. AGIABAMPOA Rose; O. Hoffm. in Engl. & Prantl, Pflanzenfam. 4⁵: 390. 1894.

REFERENCE: Rose, Contr. U. S. Nat. Herb. 1: 335. pl. 32. 1895.

1. *Agiabamboa congesta* Rose; O. Hoffm. in Engl. & Prantl, Pflanzenfam. 4⁵: 390. 1894.

Sinaloa; type from Agiabampo.

Woody below, 1.5 to 2 meters high, strigillose, exuding a gum with odor of turpentine; leaves opposite, often alternate above, their blades lance-ovate to linear-lanceolate, 3 to 8.5 cm. long, 0.4 to 2.5 cm. wide, acuminate, subentire,

triplinerved, short-petioled; heads in small close cymose panicles at tips of branches, cylindric, about 8 mm. high, yellow; ray flowers 5 or wanting, neutral; disk flowers 10 to 18; involucre strongly graduate, of indurate, obtuse or rounded, vittate phyllaries; achenes obovoid-oblong, about 2 mm. long, trigonous or subquadrangular, glabrous, epappose. "Balayaqui."

55. **ZALUZANIA** Pers. Syn. Pl. 2: 473. 1807.

REFERENCE: Robinson & Greenman, Proc. Amer. Acad. 34: 530-534. 1899.

Herbs or shrubs; leaves alternate; heads radiate or discoid, yellow, solitary or paniced; involucre about 2-seriate, appressed; receptacle conical; rays fertile; achenes of the ray trigonous, sometimes with a few deciduous aristiform squamellae; disk achenes somewhat compressed, epappose.

Heads discoid.....7. **Z. pringlei**.

Heads radiate.

Leaves 3-lobed.....1. **Z. grayana**.

Leaves entire to dentate, not lobed.

Leaves densely canescent-tomentulose beneath.

Involucre green, merely puberulent.....2. **Z. augusta**.

Involucre canescent-tomentulose.

Leaf blades ovate or triangular, obtuse, abruptly contracted into often winged petioles.....3. **Z. mollissima**.

Leaf blades rhombic-ovate or elliptic-ovate, cuneately narrowed into short naked petioles.....4. **Z. megacephala**.

Leaves green or griseous-pubescent beneath.

Leaf blades triangular-ovate, 1 to 4 cm. wide, abruptly contracted into winged petioles 0.5 to 2 cm. long.....5. **Z. montagnaeifolia**.

Leaf blades broadly ovate or oval-ovate, 3.5 to 8.5 cm. wide, on short, essentially naked petioles.....6. **Z. coulteri**.

1. **Zaluzania grayana** Robins. & Greenm. Proc. Amer. Acad. 34: 531. 1899.

Gymnolomia triloba A. Gray, Proc. Amer. Acad. 17: 217. 1882. Not *Zaluzania triloba* Pers. 1807.

Chihuahua. Arizona and New Mexico; type collected south of Rucker's Valley, Chiricahua Mountains, Arizona.

Suffrutescent, 80 cm. high; stem puberulous; leaf blades ovate, 3 to 7 cm. long, green on both sides, the primary lobes toothed or slightly lobed; heads about 2 cm. wide.

2. **Zaluzania augusta** (Lag.) Schultz Bip. Flora 44: 562. 1861.

Ferdinanda augusta Lag. Gen. & Sp. Nov. 31. pl. 2. 1816.

Anthemis lutescens Cervant. in Llave & Lex. Nov. Veg. Deser. 1: 30. 1824.

Chrysophania fastigiata Kunth; Less. Syn. Gen. Comp. 224. 1832.

Ferdinanda lutescens DC. Prodr. 5: 553. 1836.

Zaluzania angusta Benth. & Hook. Gen. Pl. 2: 362. 1873.

Guanajuato to Mexico; type from Mexico, without definite locality.

Shrub up to 2.5 meters high, much branched; leaf blades lance-ovate to triangular-ovate, 1.5 to 7 cm. long, entire to coarsely toothed; heads 7 to 12 mm. wide, numerous in cymose panicles; phyllaries lance-ovate to ovate, mostly acutish. "Caxtidani" (Querétaro); "cenicilla;" "limpia-tunas" (Mexico, Oaxaca).

The name "limpia-tunas" is said to be given because of the fact that the plant usually grows with prickly-pears, and the branches are used as brushes for removing the fine spines from the tunas. The plant is said to have the odor of southernwood (*Artemisia abrotanum*).

3. *Zaluzania mollissima* A. Gray, Proc. Amer. Acad. **15**: 35. 1879.
Zacatecas, San Luis Potosí, and Puebla; type from City of San Luis Potosí.
Shrubby, about 1.5 meters high; leaf blades 2 to 5.2 cm. long, entire to crenate, cuneate to subcordate at base; heads 1 to 2.5 cm. wide, several or numerous; phyllaries ovate to oval, obtuse.
4. *Zaluzania megacephala* Schultz Bip. Flora **44**: 563. 1861.
Ferdinanda augusta megacephala Schultz Bip. Flora **44**: 563. 1861, as synonym.
Hidalgo and Coahuila; type from Real del Monte, Hidalgo.
Suffrutescent (?), about 60 cm. high, simple below the inflorescence; stem cinereous-puberulous; leaf blades 5 to 11 cm. long, 2 to 8 cm. wide, serrulate except at the cuneate base; petioles 2 to 3 mm. long; heads about 2 cm. wide, several or many.
5. *Zaluzania montagnaeifolia* Schultz Bip. Flora **44**: 563. 1861.
Ferdinanda montagnaeifolia Schultz Bip. Allg. Gartenz. **1858**: 179. 1858, nomen nudum.
Zaluzania asperrima Schultz Bip. Flora **47**: 218. 1864.
Zaluzania asperrima montagnaeifolia Robins. & Greenm. Proc. Amer. Acad. **34**: 532. 1899.
Veracruz, Puebla, and Oaxaca; type from between Veracruz and Orizaba.
Shrub; stem puberulous; leaf blades 2 to 6 cm. long, acuminate to obtuse, coarsely crenate-dentate or the upper entire, rough above, griseous-pilosulous or puberulous beneath; heads numerous, 1 to 1.5 cm. wide.
6. *Zaluzania coulteri* Hemsl. Biol. Centr. Amer. Bot. **2**: 159. *pl. 46*. 1881.
Hidalgo; type from Real del Monte.
Suffrutescent at base (?), simple below the inflorescence; leaf blades 6 to 12.5 cm. long, thin, serrulate, green above, pale and pilosulous beneath; heads about 1.8 cm. wide.
7. *Zaluzania pringlei* Greenm. Proc. Amer. Acad. **39**: 101. 1903.
Known only from the type locality, near Jojutla, Morelos.
Shrub; branches puberulous; leaf blades ovate, 3.5 to 5 cm. long, 2 to 3.5 cm. wide, subentire to crenate-dentate, puberulent beneath, on petioles 1 to 1.5 cm. long; heads 6 to 7 mm. high.

DOUBTFUL SPECIES.

ZALUZANIA CINERASCENS Schultz Bip. Flora **47**: 219. 1864. This species, based on *Ehrenberg* 346, from Mineral del Monte, Hidalgo, is insufficiently known. It is probably not a member of the genus.

56. *BORRICHIA* Adans. Fam. Pl. **2**: 130. 1763.

1. *Borrichia frutescens* (L.) DC. Prodr. **5**: 489. 1836.
Bupthalmium frutescens L. Sp. Pl. 903. 1753.
Diomedea bidentata Cass. Dict. Sci. Nat. **13**: 283. 1819.
Borrichia frutescens angustifolia DC. Prodr. **5**: 489. 1836.
Trimetra ficoidea Moc.; DC. Prodr. **7**: 262. 1838.
Tamaulipas to San Luis Potosí and "Veracruz." Virginia to Texas; Bermuda; type from "Jamaica, Virginia."
Shrubby, about 1 meter high, the stems canescent-strigillose or glabrate; leaves opposite, oblanceolate or obovate, 2 to 5.5 cm. long, entire or toothed, densely canescent-strigillose, mucronate; heads solitary at tips of branches, yellow, radiate, about 2.5 cm. wide; phyllaries spinescent-pointed; pales with stiff spiny tips; rays and disk fertile; achenes quadrangular; pappus a 4-toothed crown.

57. **WEDELIA** Jacq. Enum. Pl. Carib. 8. 1760.1. **Wedelia acapulcensis** H. B. K. Nov. Gen. & Sp. 4: 215. 1820.

Sinaloa to Guerrero and Oaxaca, and perhaps farther southward; type from Acapulco, Guerrero.

Suffrutescent, hispidulous and spreading-hirsute; leaves opposite, short-petioled, ovate, 3.5 to 8 cm. long, 1.5 to 4.8 cm. wide, serrate, harsh-pubescent; heads solitary or few at tips of stem and branches, long-peduncled, radiate, yellow, 1.5 to 2.2 cm. wide; involucre 2 or 3-seriate, the phyllaries herbaceous above, or the outermost so throughout; rays fertile; achenes obovoid, thickened, sometimes thin-margined but not truly winged; pappus a crown of connate fimbriate squamellae and usually 2 awns.

58. **WYETHIA** Nutt. Journ. Acad. Phila. 7: 39. pl. 5. 1834.1. **Wyethia mexicana** S. Wats. Proc. Amer. Acad. 25: 154. 1890.

Known only from the type locality, near Monterrey, Nuevo León.

Suffrutescent, 1 to 1.6 meters high, spreading-hirsute; leaves alternate, the blades lance-ovate, 6 to 10 cm. long, crenate-dentate, green above, cinereous-subtomentose beneath; heads few, yellow, 3 to 5.5 cm. wide; involucre several-seriate, graduate, the phyllaries lanceolate, pubescent and densely ciliate, squarrose; rays fertile; achenes subquadrangular, several-ribbed; pappus of 2 short unequal palceaceous awns, connected by a crown of very short connate squamellae.

59. **ASPILIA** Thouars, Gen. Nov. Madagasc. 12. 1806.

Shrubs or herbs; leaves opposite; heads radiate, rarely discoid, yellow, rarely white or purple, the rays neutral; involucre few-seriate, the phyllaries herbaceous at least at apex; achenes obovoid, plump, wingless; pappus a cup composed of united squamellae, sometimes with awns added.

Leaves linear or narrowly linear-lanceolate.

Plants tall; heads several or numerous.

Leaves densely hispid-pilose beneath.....1. **A. angusta.**

Leaves rather sparsely strigillose or strigose beneath...2. **A. stenophylla.**

Plants low; heads solitary.....3. **A. rosei.**

Leaves elliptic or oblong to ovate.

Rays yellow.

Leaves elliptic-lanceolate; plant 30 cm. high or less.....3. **A. rosei.**

Leaves ovate or lance-ovate; plant much taller.....4. **A. strigosa.**

Rays purple or none.

Rays purple.....5. **A. purpurea.**

Rays none.....6. **A. aggregata.**

1. **Aspilia angusta** Blake, Contr. U. S. Nat. Herb. 22: 619. 1924.

Aspilia angustifolia A. Gray in S. Wats. Proc. Amer. Acad. 22: 425. 1887.

Not *A. angustifolia* Oliver & Hiern, 1877.

Known only from the type locality, Tequila, Jalisco.

Suffrutescent (?), about 1.5 meters high, densely tuberculate-strigillose or ascending-hispidulous; leaves short-petioled, linear-lanceolate, 4 to 6.5 cm. long, 4 to 7 mm. wide, very harsh above, obscurely serrulate; heads numerous, loosely paniced, about 2 cm. wide; phyllaries indurate to middle or above.

2. **Aspilia stenophylla** Greenm. Proc. Amer. Acad. 39: 102. 1903.

Sierra Madre of Chihuahua; type from Seven Star Mine.

Suffrutescent (?), about 70 cm. high, finely strigillose; leaves short-petioled, linear-lanceolate or linear, 3.5 to 12 cm. long, 2.5 to 10 mm. wide; heads 1.5 to 1.8 cm. wide; outer phyllaries caudate-acuminate.

3. *Aspilia rosei* Greenm. Proc. Amer. Acad. 40: 39. 1904.

Tepic and Durango; type collected between Santa Gertrudis and Santa Teresa, Sierra Madre of Tepic.

Suffrutescent, about 30 cm. high, hispidulous and hispid-hirsute; leaves short-petioled, linear to elliptic-lanceolate, 2 to 5 cm. long, 4 to 10 mm. wide, revolute-margined, subentire; heads solitary at tips of stems and branches, about 2 cm. wide; involucre subequal.

4. *Aspilia strigosa* (Hook. & Arn.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 171. 1881.

Wedelia strigosa Hook. & Arn. Bot. Beechey Voy. 435. 1840-41.

Guerrero and "Veracruz;" type from Acapulco, Guerrero.

Suffrutescent (?), probably about 1 meter high, hispidulous and sparsely hispid; leaf blades 4 to 6.5 cm. long, 1.7 to 2.3 cm. wide, acuminate, harsh above, rather softly pubescent beneath; heads 1 to 3 at tips of stem and branches, about 1.8 cm. wide.

5. *Aspilia purpurea* Greenm. Proc. Amer. Acad. 40: 39. 1904.

Aspilia scabrada T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 420. 1924.

Chiapas; type from Valley of Jiquipilas.

Suffrutescent, about 40 cm. high, strigose, spreading-hispid toward base; leaves oval to elliptic, 2.2 to 5 cm. long, 0.8 to 2 cm. wide, acute, short-petioled or subsessile, serrate or serrulate; heads solitary, long-peduncled, about 3 cm. wide; flowers all purple.

6. *Aspilia aggregata* Greenm. Proc. Amer. Acad. 39: 102. 1903.

Known only from the type locality, between Bolaños and Guadalajara, Jalisco.

Suffrutescent (?), about 0.5 meter high; stem and branches slender, tuberculate-strigose; leaves short-petioled, elliptic, 2.5 to 4 cm. long, 5 to 10 mm. wide, acute, serrulate, sparsely tuberculate-hispid on both sides; heads small, discoid, about 9 mm. high, in close clusters of about 2 to 5 apex of long naked peduncles; phyllaries acuminate, purplish, densely brownish-ciliolate or -ciliate, on back somewhat strigose and strigillose.

60. *TITHONIA* Desf.; Gmel. Syst. Nat. 1259. 1791.

REFERENCE: Blake, Revision of the genus *Tithonia*, Contr. U. S. Nat. Herb. 20: 423-436. 1921.

Herbs or shrubs; leaves alternate, or opposite below; heads radiate, yellow, large, borne on fistulose peduncles; involucre (in the following species) 4-seriate, strongly graduate, the phyllaries broad; rays neutral; achenes plump; pappus of free or connate squamellae, with or without awns, or entirely wanting.

Pappus present.

Leaves unlobed; stem densely and canescently pilose-tomentose.

1. *T. fruticosa*.

Leaves usually 3 or 5-lobed; stem not canescently pilose-tomentose.

2. *T. diversifolia*.

Pappus wanting..... 3. *T. scaberrima*.

1. *Tithonia fruticosa* Canby & Rose, Contr. U. S. Nat. Herb. 1: 104. *pl.* 5. 1891.

Sonora and Sinaloa to Chihuahua and Durango; type from Alamos, Sonora.

Stout shrub, 3 or 4 meters high; leaf blades ovate or lanceolate, 6.5 to 30 cm. long, 2.2 to 14 cm. wide, rather softly and densely canescent-pilose; heads 7 to 9.5 cm. wide; pappus a paleaceous crown, the awns obsolete or represented by short teeth.

2. *Tithonia diversifolia* (Hemsl.) A. Gray, Proc. Amer. Acad. 19: 5. 1883.

Mirasolia diversifolia Hemsl. Biol. Centr. Amer. Bot. 2: 168. *pl.* 47. 1881.

Veraacruz to Oaxaca and Yucatán; type from Valley of Orizaba, Veraacruz. Guatemala to Costa Rica; established in Ceylon and India.

Stout perennial herb, or perhaps shrubby, 3 to 9 meters high; stem hispid-pilose to sordidly pilose-tomentose, glabrate; leaf blades ovate or deltoid-ovate, 7 to 20 cm. long, green above, paler or subcanescent beneath; heads 6 to 14 cm. wide; pappus of 2 awns and several squamellae. "Jalacate," "guasmara," "mirasol" (El Salvador).

2a. *Tithonia diversifolia glabriuscula* Blake, Contr. U. S. Nat. Herb. **20**: 435. 1921.

Veraacruz and Oaxaca; type from Tuxtepec, Oaxaca.

Stem essentially glabrous; leaves very sparsely pubescent beneath.

3. *Tithonia scaberrima* Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. **1852**: 91. 1852.

Tithonia platylepis Schultz Bip.; Benth. & Hook. Gen. Pl. **2**: 368. 1873, as synonym.

Mirasolia scaberrima Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. **2**: 168. 1881.

Gymnolomia platylepis A. Gray, Proc. Amer. Acad. **19**: 5. 1883.

Gymnolomia decurrens Klatt, Leopoldina **23**: 90. 1889.

Perimeniopsis perfoliata Schultz Bip.; Klatt, Leopoldina **23**: 90. 1889, as synonym.

Tithonia glaberrima Kuntze, Rev. Gen. Pl. **1**: 371. 1891.

Gymnolomia scaberrima Greenm. Field Mus. Bot. **2**: 268. 1907.

Veraacruz to Chiapas. Guatemala to Costa Rica; type from vicinity of Chinotega, Segovia, Nicaragua.

Herbaceous or suffrutescent, 1.3 to 5 meters high; stem densely spreading-pilose or hispid-pilose, or sometimes incurved-hispid; leaf blades ovate or lance-ovate, 8.5 to 17 cm. long, 2.5 to 9.8 cm. wide, acuminate, scabrous above, pale or canescent beneath with dense spreading hairs; heads 5 to 7 cm. wide; phyllaries broadly rounded; pappus none. "Pulagaste," "mirasol" (El Salvador).

In El Salvador the leaves are used in baths for fevers and colds.

61. VIGUIERA H. B. K. Nov. Gen. & Sp. **4**: 224. *pl.* 379. 1820.

REFERENCE: Blake, A revision of the genus *Viguiera*, Contr. Gray Herb. n. ser. **54**: 1-205. *pl.* 1-3. 1918.

Herbs or shrubs; leaves opposite, at least below; heads small to large, yellow (in our species), radiate; involucre 2 to 7-seriate, graduate or subequal, the phyllaries usually with indurate base and herbaceous tip; rays neutral; achenes thickened; pappus persistent, of 2 awns and several free or united squamellae, or wanting.

Leaves pinnatilobate.

Leaf lobes attenuate..... **19. V. stenoloba.**

Leaf lobes blunt (the terminal one sometimes acute).

Leaves densely and softly tomentose beneath..... **17. V. zaluzanioides.**

Leaves not densely tomentose beneath.

Leaves several-lobed, subcanescent beneath..... **16. V. pinnatilobata.**

Leaves hastately 3-lobed, scarcely subcanescent beneath.

18. V. tripartita.

Leaves entire to lacinate.

Leaves small (the blades 0.7 to 2.5 cm. long), canescent at least beneath; heads solitary.

Pappus none; achene glabrous..... **22. V. greggii.**

Pappus present; achene pubescent.

Leaf blades ovate or triangular-ovate, acute or sometimes obtuse.

20. *V. brevifolia*.

Leaf blades rotund or roundish-ovate, obtuse to rounded or retuse.

21. *V. bicolor*.

Leaves larger, usually not canescent, or if small, then heads 2 to 4.

Leaves laciniate or deeply jagged-serrate.

Plant resinous; stem pubescent throughout..... 10. *V. laciniata*.

Plant not resinous; stem glabrous below..... 11. *V. subincisa*.

Leaves entire or merely serrate.

Plant densely pannose-tomentose..... 15. *V. lanata*.

Plant not pannose-tomentose.

Leaf blades narrowly oblong to broadly linear, densely canescent-hispidulous beneath..... 1. *V. angustifolia*.

Leaves ovate or lance-ovate, usually not canescent-hispidulous beneath.

Leaf blades 8 to 12 mm. long..... 14. *V. microphylla*.

Leaf blades larger.

Leaves densely silky or pilose-tomentose beneath.

Pappus none; achenes glabrous..... 7. *V. bombycina*.

Pappus present; achenes pubescent.

Leaves densely silky-canescens beneath.

6. *V. grammatoglossa*.

Leaves densely pilose-tomentose beneath.

12. *V. tomentosa*.

Leaves not densely silky or pilose-tomentose beneath.

Pales tipped with stiff abrupt spreading mucros.

2. *V. sphaerocephala*.

Pales without stiff spreading mucros.

Heads at first subcylindric, very numerous; involucre 2-seriate, 5 to 6 mm. high..... 5. *V. quinqueradiata*.

Heads not subcylindric, usually few.

Involucre 4 to 5-seriate, of linear-lanceolate to lanceolate phyllaries with thickened midrib.

Leaves ovate to oval..... 8. *V. pringlei*.

Leaves lanceolate to ovate-oblong..... 9. *V. seemannii*.

Involucre 2 to 4-seriate, of oblong or lance-ovate phyllaries without strongly thickened midrib.

Phyllaries with ovate indurate base and lance-oblong herbaceous apex, canescently strigillose and often strigose or hispid..... 13. *V. deltoidea*.

Phyllaries oblong, with conspicuous pale margins, on back glabrous, pilosulous, or pilose.

Phyllaries and petioles sparsely ciliate.

3. *V. maculata*.

Phyllaries and petioles strongly ciliate.

4. *V. eriophora*.

1. *Viguiera angustifolia* (Hook. & Arn.) Blake, Proc. Amer. Acad. 51: 518. 1916.

Tithonia angustifolia Hook. & Arn. Bot. Beechey Voy. 435. 1841.

Viguiera blepharolepis A. Gray, Proc. Amer. Acad. 19: 5. 1883.

Sinaloa, Tepic, and Jalisco; type from Tepic.

Suffrutescent (?); stem slender, densely strigose or strigillose, subglabrate; leaves opposite, short-petioled, the blades 3 to 9.5 cm. long, 4 to 13 mm. wide; heads solitary, 3 to 5 cm. wide; involucre 11 to 19 mm. high, 4 to 5-seriate, the phyllaries oval to oblong, canescently strigillose and ciliate.

2. *Viguiera sphaerocephala* (DC.) Hemsl. Biol. Centr. Amer. Bot. **2**: 179. 1881.
Leighia sphaerocephala DC. Prodr. **5**: 582. 1836.
Encelia squarrosa Greenm. Proc. Amer. Acad. **39**: 112. 1903.
Viguiera squarrosa Blake, Proc. Amer. Acad. **49**: 376. 1913.
 Guerrero; type from Mexico, without definite locality.
 Shrub 5 to 7 meters high; branches sordid-tomentose; leaf blades ovate, 9 to 10 cm. long, crenate-dentate, pilosulous beneath; heads cymose-panicled, 5 cm. wide; phyllaries oblong, ciliolate and puberulous, the spreading herbaceous tips as long as the indurate body.
3. *Viguiera maculata* (T. S. Brandeg.) Blake, Proc. Amer. Acad. **49**: 374. 1913.
Encelia maculata T. S. Brandeg. Zoe **5**: 259. 1908.
 Oaxaca and Puebla; type from San Luis Tultitlanapa, Puebla.
 Shrub; branches appressed-pubescent; leaf blades ovate or lance-ovate, 5 to 12 cm. long, harshly lepidote-strigillose above, hispidulous beneath; heads 2.7 to 3.5 cm. wide, in cymose panicles of 3 to 8; involucre 6 to 7 mm. high, the phyllaries with abrupt triangular herbaceous tips.
4. *Viguiera eriophora* Greenm. Proc. Amer. Acad. **39**: 104. 1903.
 Oaxaca.
 Shrub; branches canescent-tomentose; leaf blades ovate, 7 to 13.5 cm. long, serrate, tuberculate-hispidulous above, hispidulous-pilosulous beneath; heads 2.5 to 5 cm. wide, numerous in trichotomous panicles; involucre 8 to 10 mm. high.
5. *Viguiera quinqueradiata* (Cav.) A. Gray in S. Wats. Proc. Amer. Acad. **22**: 426. 1887.
Helianthus quinque-radiatus Cav. Icon. Pl. **3**: 36. pl. 272. 1795.
Leighia ? *leptocephala* DC. Prodr. **5**: 582. 1836.
 Jalisco; type from Mexico, without definite locality.
 Shrub, 3 to 7 meters high; branchlets puberulous; leaf blades ovate, 3 to 15 cm. long, serrulate or serrate, scabrous above, loosely hispidulous-pilosulous beneath; heads about 2 cm. wide, the disk at first 1 cm. high, 3.5 to 5 mm. thick. "Vara blanca" (Dugès).
6. *Viguiera grammatoglossa* DC. Prodr. **5**: 580. 1836.
Encelia hypargyrea Robins. & Greenm. Amer. Journ. Sci. III. **50**: 155. 1895.
 Not *V. hypargyrea* Greenm. 1903.
Viguiera argyrophylla Blake, Proc. Amer. Acad. **49**: 374. 1913.
 Michoacán, Puebla, and Oaxaca; type from Tlapujahua, Michoacán.
 Shrubby (?), 1.6 to 5 meters high; stem densely hispid-pilose; leaf blades 4.4 to 8 cm. long, greenish above, densely appressed-silky beneath; heads in cymose panicles of 2 to 8, 2.8 to 5 cm. wide; involucre 8 to 10.5 mm. high, hispid-pilose or subsericeous.
7. *Viguiera bombycina* Blake, Contr. Gray Herb. n. ser. **54**: 71. 1918.
Gymnolomia sericea Klatt, Leopoldina **23**: 90. 1887. Not *Viguiera sericea* A. Gray, 1883.
 Puebla; type from Mexico, without definite locality.
 Shrubby; stem subsericeous-pilose, subglabrate; leaf blades 2.5 to 5.3 cm. long, entire, dull green or canescent above, densely silky-pilose with appressed hairs beneath; heads 1 to 3, 4.5 cm. wide; involucre 7 to 8 mm. high, silky-pilose.
8. *Viguiera pringlei* Robins. & Greenm. Proc. Amer. Acad. **29**: 387. 1894.
 Tepic and Jalisco; type from Zapotlán, Jalisco.
 Shrub up to 3.3 meters high; stem tuberculate-hispid; leaf blades 4 to 7.3 cm. long, subsessile, green and harshly lepidote-tuberculate on both sides, strongly

reticulate beneath; heads 2.5 cm. wide, in contracted cymes or cymose panicles of 3 to 15; phyllaries densely granular-tuberculate, hispidulous-ciliolate.

9. *Viguiera seemannii* Schultz Bip. in Seem. Bot. Voy. Herald 305. 1856.

Oyedaea seemanni A. Gray, Proc. Amer. Acad. 19: 10. 1883.

Known only from the type locality, Sierra Madre of northwestern Mexico.

Frutescent; stem densely tuberculate-setulose and hispidulous; leaf blades 4 to 10 cm. long, harshly tuberculate-setulose above, hispid-pilosulous beneath and reticulate; heads 1.7 cm. wide, subsessile in cymes of 3 to 5; phyllaries tuberculate and hispidulous.

10. *Viguiera laciniata* A. Gray in Torr. U. S. & Mex. Bound. Bot. 89. 1859.

Northern Baja California. California; type from Rancho Gamacha, east of San Diego.

Frutescent, up to 1.3 meters high; leaves alternate, the blades lanceolate to lance-ovate, 1.5 to 3 cm. long, laciniately repand-lobate, green and tuberculate-hispid on both sides; heads 1.7 to 2.7 cm. wide, in cymose panicles of 3 to 13; involucre 6 mm. high, hispidulous.

11. *Viguiera subincisa* Benth. Bot. Voy. Sulph. 27. 1844.

Known only from the vicinity of the type locality, Magdalena Bay, Baja California.

Suffrutescent (?) or herbaceous, about 60 cm. high; leaves opposite below, alternate above, the blades ovate, 4.8 to 6.3 cm. long, incisely jagged-serrate with 5 to 10 pairs of triangular teeth; heads 1.4 to 3.5 cm. wide, 12 to 26 in a narrow long-peduncled panicle; involucre 3.5 mm. high, strigillose.

12. *Viguiera tomentosa* A. Gray, Proc. Amer. Acad. 5: 161. 1861.

Cape region of Baja California; type from Cape San Lucas.

Shrubby, 3 to 4 meters high; stem pilosulous; leaf blades ovate or triangular-ovate, 4 to 10 cm. long, canescent or greenish-canescens above; heads 3.3 to 4 cm. wide, 3 to 16 in terminal panicles; involucre 6 to 10 mm. high, densely pilose-tomentose.

13. *Viguiera deltoidea* A. Gray, Proc. Amer. Acad. 5: 161. 1861.

Baja California; type from Cape San Lucas.

Shrub, 3 meters high; stem strigillose or hispid; leaf blades deltoid-ovate, 2.5 to 6.5 cm. long, usually dentate, harshly or rather softly pubescent beneath; heads several, usually about 3.5 cm. wide.

13a. *Viguiera deltoidea townsendii* Vasey & Rose, Proc. U. S. Nat. Mus. 13: 148. 1890.

Known only from the type locality, Socorro Island.

Leaf blades ovate to oblong-ovate, 2.5 to 5.7 cm. long, obtuse or rounded, entire, scabrously tuberculate-strigillose above, beneath rather softly pilose or sometimes hispidulous-strigillose; heads 1.7 to 3.8 cm. wide.

13b. *Viguiera deltoidea tastensis* T. S. Brandeg. Zoe 5: 161. 1903.

Known only from the type locality, Sierra El Taste, Baja California.

Leaf blades 6 to 10 cm. long, very harsh above, beneath rather softly and densely hispidulous-pilosulous, crenate-dentate; heads 4.5 to 5 cm. wide.

13c. *Viguiera deltoidea parishii* (Greene) Vasey & Rose, Contr. U. S. Nat. Herb. 1: 72. 1890.

Viguiera parishii Greene, Bull. Torrey Club 9: 15. 1882.

Sonora and northern Baja California. Nevada to California and Arizona; type from San Luis Rey, California.

Stem harshly tuberculate-hispidulous; leaf blades rather small, deltoid, strongly toothed and reticulate, harshly pubescent; heads mostly solitary and long-peduncled.

- 13d. *Viguiera deltoidea chenopodina*** (Greene) Blake, Contr. Gray Herb. n. ser. 54: 91. 1918.
Viguiera chenopodina Greene, Leaflets 2: 154. 1911.
 Baja California; type collected between Santo Domingo and Matancita.
 Leaf blades small, deltoid- or rhombic-ovate, 1.5 to 2.5 cm. long, entire, obtuse or rounded, canescent-strigillose beneath or on both sides.
- 14. *Viguiera microphylla*** Vasey & Rose, Proc. U. S. Nat. Mus. 11: 535. 1890.
 Northern Baja California; type collected 64 km. inland from Lagoon Head.
 Shrubby, about 60 cm. high; branches canescent-strigillose; leaf blades ovate, 8 to 12 mm. long, 5 to 8 mm. wide, entire, canescent-strigillose; heads 2 to 4, long-peduncled, 1.5 cm. wide; involucre 3 to 4 mm. high, canescent-strigillose.
- 15. *Viguiera lanata*** (Kellogg) A. Gray, Proc. Amer. Acad. 17: 218. 1882.
Bahiopsis lanata Kellogg, Proc. Calif. Acad. 2: 35. 1863.
 Cedros Island, Baja California.
 Frutescent at base, 35 to 55 cm. high, densely pannose-tomentose; leaves chiefly basal, the blades oval or roundish-ovate, 2.5 to 5.5 cm. long; heads few, 4.5 to 6 cm. wide.
- 16. *Viguiera pinnatilobata*** (Schultz Bip.) Blake, Contr. Gray Herb. n. ser. 54: 95. 1918.
Zaluzania pinnatilobata Schultz Bip. Flora 47: 219. 1864.
Gymnolomia pinnatilobata Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 163. 1881.
 Puebla and Oaxaca; type from Tehuacán, Puebla.
 Shrubby, 1 meter high; stem puberulous; leaves chiefly alternate, the blades ovate or deltoid-ovate in outline, 2 to 4 cm. long, deeply pinnatilobate, the lobes 1 to 3 pairs, short, entire or slightly toothed or lobed; heads in cymose panicles of 3 or more, 3.5 cm. wide; involucre sparsely strigose and strigillose; achenes glabrous, epappose.
- 17. *Viguiera zaluzanioides*** Blake, Contr. Gray Herb. n. ser. 54: 96. 1918.
 Known only from the type locality, San Antonio, Oaxaca.
 Shrubby; stem and branches canescently pilosulous-tomentose, subglabrate; leaf blades ovate or triangular-ovate in outline, 2 to 4.5 cm. long, pinnately 5 to 7-lobed, canescent-tomentose beneath; heads about 1.4 cm. wide; involucre rather densely pilose; achenes glabrous, epappose.
- 18. *Viguiera tripartita*** (Robins. & Greenm.) Blake, Proc. Amer. Acad. 49: 97. 1918.
Gymnolomia tripartita Robins. & Greenm. Amer. Journ. Sci. III. 50: 154. 1895.
 Oaxaca; type from Cuicatlán.
 Herbaceous (?); stem nearly glabrous; leaf blades lanceolate or lance-ovate in outline, 4 to 6 cm. long, deeply 3-lobed, with short, blunt, entire or slightly lobed divisions, barely subcanescent beneath; heads 2 cm. wide; involucre sparsely strigose; achenes glabrous, epappose.
- 19. *Viguiera stenoloba*** Blake, Contr. Gray Herb. n. ser. 54: 97. 1918.
Heliomeris tenuifolia A. Gray, Mem. Amer. Acad. n. ser. 4: 84. 1849. Not *V. tenuifolia* Gardn. 1848.
Gymnolomia tenuifolia Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 163. 1881.
 Chihuahua to Tamaulipas; type from Coahuila. Texas.
 Much-branched shrub 1 meter high; stem glabrous or strigillose; leaf blades ovate in outline, 2.5 to 6 cm. long, divided nearly to midrib into 3 to 7 linear or linear-lanceolate lobes 1 to 5 mm. wide, canescent-strigillose beneath; heads solitary, 1.8 to 3 cm. wide; achenes glabrous, epappose.

20. *Viguiera brevifolia* Greenm. Proc. Amer. Acad. 39: 103. 1903.

Coahuila and Durango; type from Mapimí, Durango.

Much-branched shrub 1 meter high; stem strigillose; leaf blades 1 to 2.1 cm. long, above greenish or canescent, beneath canescent-strigillose; heads 1.4 cm. wide; achenes sparsely pubescent near apex; pappus squamellae equaling the awns.

21. *Viguiera bicolor* Blake, Proc. Amer. Acad. 51: 519. 1916.

Known only from the type locality, between Río Grande and Jamaltepec, Hidalgo (?).

Shrub; branches canescent-strigillose; leaf blades 1.2 to 1.8 cm. long, greenish above, canescent-strigillose beneath; heads 1.8 cm. wide; achenes subsericeous; pappus squamellae shorter than the awns.

22. *Viguiera greggii* (A. Gray) Blake, Contr. Gray Herb. n. ser. 54: 100. 1918.

Gymnolomia greggii A. Gray, Proc. Amer. Acad. 15: 36. 1879.

Coahuila.

Much-branched undershrub 30 to 40 cm. high, finely canescent; leaf blades broadly ovate or oval, 7 to 25 mm. long, rounded to obtuse, greenish above, canescent-strigillose beneath; heads 1.8 to 4 cm. wide; achenes glabrous, epappose.

62. *ALVORDIA* T. S. Brandeg. Proc. Calif. Acad. II. 2: 174. 1889.

Frutescent; leaves opposite, or alternate above, subentire; heads 1 to 5-flowered, radiate or discoid, in small terminal glomerules; involucre compressed, strongly graduate, the phyllaries indurate; rays neutral; achenes thickened; pappus of about 10 to 20 unequal paleaceous awns.

The following treatment contains all the known species of this genus.

Phyllaries densely strigillose dorsally; rays 1 or 2.....**1. *A. glomerata*.**

Phyllaries ciliolate, essentially glabrous dorsally; rays none.

Leaves ovate, 1.3 to 3 cm. wide.....**2. *A. fruticosa*.**

Leaves narrowly lanceolate, 5 to 10 mm. wide.....**3. *A. angusta*.**

1. *Alvordia glomerata* T. S. Brandeg. Proc. Calif. Acad. II. 2: 174. 1889.

Baja California; type from mesas about Purísima and Comondú.

Shrubby, strigillose, about 1.3 meters high; leaf blades ovate or oval, 2 to 5 cm. long, triplinerved, petiolate; involucre 6 to 8 mm. high; rays 1 or 2; disk flowers 2 or 3.

2. *Alvordia fruticosa* T. S. Brandeg. Erythea 7: 5. 1899.

Baja California; type from San José del Cabo.

Similar; involucre 5 to 6 mm. high; heads 2 or 3-flowered.

3. *Alvordia angusta* Blake, Contr. Gray Herb. n. ser. 52: 42. 1917.

Baja California; type from Todos Santos.

Similar to *A. fruticosa*; leaves much narrower; heads 1 or 2-flowered.

63. *HELIANTHUS* L. Sp. Pl. 904. 1753.

Herbs or shrubs; leaves opposite or alternate; heads small to large, the rays yellow, the disk yellow, brown, or purple; involucre 2 to several-seriate, the phyllaries usually herbaceous at least at tip; rays neutral; achenes thickened; pappus deciduous, of 2 paleaceous awns and sometimes several intermediate squamellae.

The English name "sunflower" is applied commonly to the herbaceous species of the genus, while the usual Spanish names are "mirasol" and "girasol."

Leaves alternate, the blades 4.5 cm. long or less.....**1. *H. niveus*.**

Leaves opposite, the blades up to 12 cm. long.....**2. *H. similis*.**

1. *Helianthus niveus* (Benth.) T. S. Brandeg. Proc. Calif. Acad. II. 2: 173. 1889.

Encelia nivea Benth. Bot. Voy. Sulph. 27. 1844.

Helianthus tephrodes A. Gray in Torr. U. S. & Mex. Bound. Bot. 90. 1859.

Viguiera nivea A. Gray, Proc. Amer. Acad. 8: 658. 1873.

Viguiera tephrodes A. Gray, Proc. Amer. Acad. 17: 218. 1882.

Gymnolomia encelioides A. Gray, Proc. Amer. Acad. 19: 4. 1883.

Helianthus dealbatus A. Gray, Syn. Fl. 1²: 280. 1884.

Viguiera sonorae Rose & Standl. Contr. U. S. Nat. Herb. 16: 20. pl. 16. 1912.

Sonora and Baja California; type from San Quintín, Baja California. California.

Suffrutescent (sometimes annual?), decumbent at base, 30 to 60 cm. high, canescent-strigillose; leaf blades ovate or lance-ovate to oblong, obtuse to acuminate, cuneate to subcordate at base, slender-petioled, entire to serrulate, sometimes greenish above; heads several, long-peduncled, about 2.5 cm. wide; disk purple; pappus of several unequal deciduous awns and squamellae.

2. *Helianthus similis* (T. S. Brandeg.) Blake, Contr. Gray Herb. n. ser. 54: 189. 1918.

Viguiera similis T. S. Brandeg. Zoe 5: 260. 1908.

Cape Region of Baja California.

Suffruticose, thinly tomentose, 1 meter high; leaf blades cordate, long-acuminate, sharply serrate; pappus of 2 awns and usually a few squamellae. (Description compiled.)

64. **PERYMENIUM** Schrad. "Ind. Sem. Hort. Gotting. 1830;" Linnaea 6: Litt.-Ber. 73. 1831.

REFERENCE: Robinson & Greenman, Proc. Amer. Acad. 34: 521-529. 1899.

Shrubs or herbs, usually strigillose or strigose; leaves opposite, usually ovate, serrate, and petioled; heads radiate, yellow or the rays rarely white, solitary, cymose, or paniced; involucre 2 to 4-seriate, the phyllaries usually indurate below and with short herbaceous tips; receptacle paleaceous; rays pistillate; achenes somewhat compressed, wingless or rarely winged; pappus of several to many unequal or subequal setiform deciduous awns.

Leaves green above, densely and canescently or subcanescently tomentose, hispidulous, or strigillose beneath.

Leaves narrowly linear, 1 to 4 mm. wide.....28. *P. stenophyllum*.

Leaves lanceolate to ovate.

Heads larger, the disk in anthesis usually 1 cm. wide or more.

38. *P. nelsonii*.

Heads smaller, the disk in anthesis much less than 1 cm. wide.

Leaves lanceolate or lance-ovate, more than 3 times as long as wide.

Phyllaries acute or acuminate; leaves densely hispidulous with spreading hairs beneath, narrowed to an obtuse or obtusish tip.

29. *P. angustifolium*.

Phyllaries obtuse or rounded; leaves densely strigillose or hispidulous with subappressed hairs beneath, acuminate to a very acute tip.

Leaves turning blackish in drying; pedicels usually elongate.

27. *P. pellitum*.

Leaves not blackening in drying; pedicels usually short.

Leaves serrate or serrulate, not rugose above...25. *P. croceum*.

Leaves subentire, strongly impressed-veined and rugose above.

26. *P. discolor*.

Leaves ovate, less than 3 times as long as wide.

Phyllaries distinctly acute or acuminate.

Phyllaries and under surface of leaves pilose-tomentose or villous.

Leaves cordate at base, scabrous above.....12. *P. asperifolium*.

Leaves cuneate or rounded-cuneate at base, scarcely scabrous above.

30. *P. lasiolepis*.

Phyllaries strigillose; leaves subcanescently strigose and strigillose or hispidulous beneath.

Leaves slightly reticulate, strigose and strigillose or antrorse-hispidulous beneath.....31. *P. blepharolepis*.

Leaves densely reticulate and hispidulous with more or less spreading hairs beneath.....32. *P. hypoleucum*.

Phyllaries obtuse or rounded, or sometimes acuminately narrowed to an obtuse apex.

Involucre 4 to 6.5 mm. high.

Involucre 4 to 4.5 mm. high, 4.5 to 5 mm. thick.

32. *P. hypoleucum*.

Involucre 5.5 to 6.5 mm. high, 5 to 7 mm. thick.

33. *P. consobrinum*.

Involucre 7 to 8 mm. high.

Pubescence of the lower leaf surface ochroleucous...34. *P. collinum*.

Pubescence of the lower leaf surface bluish white...35. *P. ovatum*.

Leaves green beneath as well as above.

Heads large, the disk in anthesis 8 to 12 mm. thick.

Petioles 3 mm. long or less.

Phyllaries with herbaceous tips.....5. *P. subsquarrosum*.

Phyllaries without herbaceous tips.....36. *P. acuminatum*.

Petioles of the larger leaves 1 cm. long or more.

Middle and inner phyllaries 5 mm. wide or more, broadly rounded.

39. *P. latisquamum*.

Middle and inner phyllaries less than 5 mm. wide.

Leaves hispidulous chiefly along the veins beneath; some of the phyllaries usually acute or acuminate.....37. *P. macrocephalum*.

Leaves rather densely pilosulous to subtomentose beneath; phyllaries all obtuse or rounded at apex.....38. *P. nelsonii*.

Heads smaller, the disk in anthesis 7 mm. thick or less.

Leaves, branchlets, and involucre densely glandular...13. *P. glandulosum*.

Leaves, branchlets, and involucre not densely glandular, the involucre sometimes with a few glands.

Heads solitary and long-peduncled, or several and cymose at the tip of an elongate, essentially naked peduncle.

Heads solitary, rarely 2 or 3, long-peduncled...1. *P. bupthalmoides*.

Heads several, cymose at the tips of elongate, essentially naked peduncles.

Leaves (at least the middle and upper) entire, strongly conduplicate.

2. *P. jaliscense*.

Leaves distinctly serrate or serrulate.

Leaves conduplicate; phyllaries essentially without herbaceous tips.....4. *P. chihuahuense*.

Leaves plane, rarely somewhat conduplicate; phyllaries with distinctly herbaceous tips.

Stem leaves smaller, elliptic to lanceolate, 1.8 cm. wide or less.

3. *P. parvifolium*.

Stem leaves larger, ovate, 2 to 3.5 cm. wide.

5. *P. subsquarrosum*.

- Heads cymose or cymose-panicled at tips of stem and branches, rarely solitary and very short-peduncled.
- Leaves linear or linear-elliptic, 1.2 to 2.4 cm. long, 2 to 4 mm. wide
16. *P. microphyllum*.
- Leaves lanceolate or ovate, much larger.
- Phyllaries (at least the inner) acute or acuminate.
- Leaves lanceolate or lance-oblong, cuneate at base.
- Leaves very scabrous on both sides.....23. *P. chalarolepis*.
- Leaves smooth or nearly so above, slightly scabrous beneath.
24. *P. ghiesbreghtii*.
- Leaves ovate or lance-ovate.
- Heads few, 3 to 5 at apex of branches, long-pedicled.
7. *P. cornutum*.
- Heads usually numerous, cymose or cymose-panicled.
- Involute 2.5 to 3 mm. high.....10. *P. globosum*.
- Involute 4 mm. high or more.
- Phyllaries coarsely villous; leaves villous beneath.
12. *P. asperifolium*.
- Phyllaries not villous; leaves harshly pubescent beneath.
- Leaves acutely cuneate at base, usually oblong-ovate or lance-ovate.....15. *P. purpusii*.
- Leaves cuneate-rounded to truncate at base, mostly ovate.
- Phyllaries mostly acuminate....11. *P. verbessinoides*.
- Phyllaries acutish.
- Involute bearing a few shining glands.
17. *P. goldmanii*.
- Involute without shining glands.
- Leaves less than 5 cm. long.
- Rays much longer than the disk....8. *P. rude*.
- Rays equaling the disk.....18. *P. pinetorum*.
- Leaves 6 to 11 cm. long.....9. *P. pringlei*.
- Phyllaries obtuse or rounded.
- Leaves distinctly lanceolate.
- Stem simple; leaves strigillose beneath.
19. *P. rotundisquamum*.
- Stem branched; leaves antrorse-hispidulous or spreading-hispidulous beneath.....20. *P. lancifolium*.
- Leaves ovate or lance-ovate.
- Heads very small, the involucre in anthesis 3 mm. thick.
- Leaves 3 cm. long or less; pedicels 7 to 16 mm. long.
21. *P. microcephalum*.
- Leaves up to 10 cm. long; pedicels 1.2 to 2.5 cm. long.
22. *P. gracile*.
- Heads larger, the disk in anthesis 4 mm. thick or more.
- Phyllaries bearing a few shining glands....17. *P. goldmanii*.
- Phyllaries without glands.
- Petioles 1 cm. long or more.
- Leaves usually rounded at base, ovate....9. *P. pringlei*.
- Leaves acutely cuneate at base, usually oblong-ovate or lance-ovate.....15. *P. purpusii*.
- Petioles much less than 1 cm. long.
- Leaves reflexed, conduplicate, with crisped margins.
4. *P. chihuahuense*.
- Leaves not reflexed, plane.
- Leaves cordate-ovate, small, 1.5 to 3 cm. long.
6. *P. subcordatum*.

Leaves rarely cordate, mostly larger.

Heads few, borne on long pedicels in the upper axils or in a long-peduncled umbellate cyme; phyllaries with subsquarrose thick-herbaceous tips.

5. *P. subsquarrosus*.

Heads usually numerous and paniced; phyllaries with usually appressed tips.

Heads usually loosely paniced or cymose, much exceeding the leaves; involucre 4 to 7 mm. high, not strongly graduate.....8. *P. rude*.

Heads usually closely cymose-paniced at apex of branches, scarcely or not surpassing the leaves; involucre about 4-seriate, strongly graduate, 5 to 8 mm. high.....14. *P. berlandierii*.

1. *Perymenium buphthalmoides* DC. Prodr. 5: 609. 1836.

San Luis Potosí to Jalisco, Michoacán, and Puebla; type from Mexico, without definite locality.

Suffrutescent, usually 30 cm. high or less, many-stemmed, usually ascending, strigose or strigillose; leaves short-petioled, elliptic to oblong, sharply serrate, 1 to 7.5 cm. long; heads about 3 cm. wide, long-peduncled, usually solitary; phyllaries 2-seriate, subequal, acute or acuminate.

2. *Perymenium jaliscense* Robins. & Greenm. Amer. Journ. Sci. III. 50: 154. 1895.

Jalisco; type from Río Blanco.

Suffrutescent or "herbaceous," about 45 cm. high, strigose and strigillose; leaves short-petioled, the blades elliptic to oblong, 3 to 5.5 cm. long, mostly reflexed, conduplicate, entire; heads few, cymose at apex of usually elongate peduncles; involucre about 5 mm. high.

3. *Perymenium parvifolium* A. Gray, Proc. Amer. Acad. 15: 36. 1879.

Chihuahua to Querétaro; type from city of San Luis Potosí.

Suffrutescent or truly shrubby, much-branched, strigose and strigillose; stem leaves lanceolate, rarely ovate, 2 to 5 cm. long, 1.8 cm. wide or less, serrate; those of the branches usually very small, linear or elliptic and obtuse; heads 2.5 cm. wide or usually less; involucre 4 to 5 mm. high, the phyllaries obtuse or sometimes acutish.

4. *Perymenium chihuahuense* Blake, Contr. U. S. Nat. Herb. 22: 625. 1924.

Known only from the type locality, near city of Chihuahua.

Shrub, strigose and strigillose, with long erect simple branches; leaves short-petioled, lance-ovate, 2 to 3 cm. long, 7 to 10 mm. wide, reflexed, conduplicate, plicate-cripsed on margin; heads small, in terminal clusters of 3 to 5; involucre 4 to 5 mm. high, the phyllaries obtuse or the outer acutish, densely cinereous-strigillose and ciliate, practically without herbaceous tips.

5. *Perymenium subsquarrosus* Robins. & Greenm. Proc. Amer. Acad. 34: 524. 1899.

Zacatecas and Puebla; type from Plateado, Zacatecas.

Shrubby, up to 2.6 meters high, strigillose and strigose; leaves short-petioled, the blades ovate, acute or acuminate, subcordate to rounded at base, the larger 3 to 7 cm. long, 2 to 3.5 cm. wide, very rough on both sides; heads long-peduncled from the upper axils, or in a pedunculate cyme; involucre 5 to 7 cm. high, the phyllaries ovate, with obtuse, subsquarrose, herbaceous tips.

6. *Perymenium subcordatum* Blake, Contr. U. S. Nat. Herb. 22: 622. 1924.

Known only from the type locality, Tlapancingo, Oaxaca.

Shrub with flexuous branches, strigose and strigillose; leaves short-petioled, ovate, 1.5 to 3 cm. long, 9 to 17 mm. wide, acute, slightly cordate to broadly

rounded at base, serrulate, roughish on both sides; heads 3 or 4 toward tips of branches, axillary and terminal, long-peduncled; involucre about 5 mm. high, the phyllaries obtuse or rounded, with obscurely herbaceous tips.

7. *Perymenium cornutum* T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 192. 1911.

San Luis Potosí; type from Agua Media.

Suffrutescent or "herbaceous," 35 cm. high and more, hispidulous-strigillose and somewhat glandular; petioles 4 to 10 mm. long; blades ovate or lance-ovate, 4 to 5.5 cm. long, 2 to 3 cm. wide, serrate or serrulate; peduncles 2.5 to 9 cm. long; involucre 5 to 7 mm. high, the phyllaries ovate, the inner or all acute or acutish.

8. *Perymenium rude* Robins. & Greenm. Proc. Amer. Acad. 34: 526. 1899.

Puebla, Morelos, and Oaxaca; type from Las Sedas, Oaxaca.

Shrub 1 to 2 meters high, strigose and strigillose; leaves short-petioled, the blades ovate, 2 to 4.5 cm. long, 1 to 2.3 cm. wide, acute, rounded-cuneate to subtruncate at base, serrate, green and rough above, beneath paler green and rather densely hispidulous with chiefly antrorse hairs; heads about 1.8 cm. wide, few, cymose, and rather long-peduncled, or more numerous and cymose-panicled; involucre 4 to 7 mm. high, the phyllaries chiefly obtuse.

9. *Perymenium pringlei* Robins. & Greenm. Proc. Amer. Acad. 34: 526. 1899.

Sinaloa and Jalisco; type from Guadalajara, Jalisco.

Shrubby; stem strigose or strigillose; petioles 5 to 20 mm. long; blades ovate, 6 to 11 cm. long, 2 to 4 cm. wide, acuminate, coarsely serrate to subentire, harsh on both sides, beneath venose, hispid, and hispidulous; heads cymose-panicled; involucre 6 to 7 mm. high, the phyllaries obtuse or subacute. "Guisandira" (Sinaloa).

10. *Perymenium globosum* Robinson, Proc. Amer. Acad. 43: 40. 1907.

Known only from the type locality, Uruapan, Michoacán.

Shrubby, 2 meters high; stem strigillose; petioles 8 to 15 mm. long; blades ovate, 8 to 12 cm. long, 4 to 5 cm. wide, acuminate, rounded or shortly cuneate at base, closely serrate, roughish on both sides, prominulous-reticulate beneath and there hispidulous and gland-dotted; heads numerous; involucre short, 3 mm. high, the phyllaries ovate, acute or acuminate.

11. *Perymenium verbesinoides* DC. Prodr. 5: 608. 1836.

Hidalgo to Guerrero; type from Mexico, without definite locality.

Shrubby, up to 2.6 meters high; stem strigose and strigillose; petioles 2 to 13 mm. long; blades ovate, 2.5 to 8.5 cm. long, acute or acuminate, truncate to subcuneate at base, serrate, rough above, antrorse- or divergent-hispidulous beneath; heads usually in small close cymose panicles; involucre 5 to 7 mm. high, the phyllaries ovate, acute or usually acuminate.

12. *Perymenium asperifolium* Schultz Bip.; Kiatt, Leopoldina 23: 143. 1887.

Known only from the type locality, Ejutla, Oaxaca.

Leaves short-petioled, 3.7 cm. long, 1.8 cm. wide, cordate, scabrous above, villous beneath; heads cymose; phyllaries 2-seriate, oblong-lanceolate, acute, densely villous. (Description compiled.)

13. *Perymenium glandulosum* T. S. Brandeg. Zoe 5: 261. 1908.

Known only from the type locality, Barranca de Tlacuilosto, Puebla.

Small shrub; younger branches, leaves, and involucre very glandular and more or less hispid or strigose; leaves short-petioled, lanceolate or lance-elliptic, cuneate at base, 2 to 3.5 cm. long, 6 to 11 mm. wide, scabrous-pubescent; heads several, closely cymose, short-pedicelled; involucre 5 to 6 mm. high, the inner phyllaries long-acuminate, spreading at apex.

14. *Perymenium berlandierii* DC. Prodr. 5: 608. 1836.

Perymenium mendezii cylindrocephalum Robins. & Greenm. Proc. Amer. Acad. 34: 528. 1899.

Hidalgo to Morelos and Puebla; Chiapas; type from Villalpando.

Shrub, up to 4 meters high, strigose and strigillose; leaves short-petioled, lance-ovate or ovate, 3.5 to 8 cm. long, 1 to 4 cm. wide, acute or acuminate, cuneate to rounded at base, rather thick, serrate or serrulate; heads usually in close terminal cymes, often surpassed by the leaves; involucre 3 or 4-seriate, 5 to 8 mm. high, the phyllaries mostly oval or oblong, obtuse or rounded.

15. *Perymenium purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 74. 1914.

Perymenium leptopodum Blake, Proc. Amer. Acad. 51: 523. 1916.

Chiapas; type from Cerro del Boquerón. Guatemala.

Shrubby, 2 meters high, rather sparsely strigose and strigillose; petioles usually 1 to 1.6 cm. long; blades mostly oblong-ovate or lance-ovate, 4.6 to 8.5 cm. long, 1.5 to 4 cm. wide, acute or acuminate, cuneate or rarely rounded at base, serrate; heads usually rather numerous, cymose, on pedicels 0.5 to 3.2 cm. long; involucre 4 to 5 mm. high, the phyllaries ovate, obtuse to acute.

16. *Perymenium microphyllum* Robins. & Greenm. Proc. Amer. Acad. 34: 527. 1899.

Durango, without definite locality.

Shrub; branches strigillose; leaves short-petioled, linear or linear-elliptic, 1.2 to 2.4 cm. long, 2 to 4 mm. wide, acute, entire, revolute-margined, scabrous; heads scattered, axillary and terminal, small, the pedicels 7 mm. long; involucre 7 mm. high, the phyllaries ovate or lanceolate, the tips herbaceous, loose, obtuse to acute.

17. *Perymenium goldmanii* Greenm. Field Mus. Bot. 2: 269. 1907.

Known only from the type locality, Apazote, near Yohaltún, Campeche.

Shrubby; stem strigillose; petioles 3 to 12 mm. long; blades ovate or lance-ovate, 4.5 to 8 cm. long, 2 to 4 cm. wide, acuminate, broadly rounded to subcordate at base, crenate-serrate to subentire, rough above, hirsute and hirsutulous beneath and dotted with shining glands; heads small, few or numerous in close cymose clusters; involucre 4 mm. high, the phyllaries acute to obtusish, somewhat dotted with shining glands.

18. *Perymenium pinetorum* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 420. 1924.

Known only from the type locality, near Hacienda Monserrate, Chiapas.

Branching shrub, the stem strigillose; leaves short-petioled, the blades ovate or oval-ovate, 2.5 to 3.8 cm. long, 1 to 1.6 cm. wide, acute, rounded at base, serrulate, rough-strigillose on both sides, green and scarcely paler beneath; heads few, small, in small terminal cymose clusters, the pedicels 3 mm. long or less; involucre 4 mm. high, the phyllaries acute or subacuminate, strigillose; rays about 3, about 3 mm. long; disk flowers about 7.

19. *Perymenium rotundisquamum* Blake, Contr. U. S. Nat. Herb. 22: 623. 1924.

Known only from the type locality, Vallecito, Michoacán or Guerrero.

Suffrutescent, tufted; stems strigillose, simple, remotely leafy; leaves short-petioled, the blades lance-oblong or oblong, 3 to 4.8 cm. long, 1 to 1.5 cm. wide, acute, cuneate at base, serrulate, scabrous above, beneath strigillose and prominulous-reticulate; heads in small cymes at apex of stem and on subterminal peduncles; involucre about 4 mm. high, the inner phyllaries suborbicular, broadly rounded.

20. *Perymenium lancifolium* Blake, Contr. U. S. Nat. Herb. 22: 623. 1924.

Known only from the type locality, Batel, Concordia, Sinaloa.

Shrubby; stem strigillose; petioles 6 to 10 mm. long; blades lanceolate, 6 to 10 cm. long, 1 to 2 cm. wide, long-acuminate, acutely cuneate at base, serrulate, rough above, antrorse-hispid and hispidulous beneath; heads in cymes or cymose panicles; pedicels usually about 1.8 cm. long; involucre 5 to 6 mm. high, all but the outermost phyllaries oval, with broadly rounded tips.

21. *Perymenium microcephalum* Schultz Bip.; Klatt, *Leopoldina* 23: 143. 1887.

Oaxaca; type from Santa Talca.

Shrubby, finely strigillose; petioles of the upper leaves 4 to 8 mm. long; blades of the upper leaves ovate-lanceolate or ovate, 3 cm. long or less, half as wide, serrate, acute or acuminate, rounded at base; heads numerous, about 1.2 cm. wide; involucre 5 mm. high, the phyllaries obtuse, the inner with scarious yellowish tips.

22. *Perymenium gracile* Hemsl. *Biol. Centr. Amer. Bot.* 2: 181. 1881.

Known only from the type locality, San Cristóbal, Orizaba, Veraacruz.

Strigillose; petioles up to 12 mm. long; blades lance-ovate, up to 10 cm. long, very acute, serrulate, scabrid-strigillose; heads small, few-flowered, numerous in leafy panicles; involucre 4 mm. high, the phyllaries obtuse. (Description compiled.)

23. *Perymenium chalarolepis* Robins. & Greenm. *Proc. Amer. Acad.* 34: 525. 1899.

Known only from the type locality, mountains of Chiapas.

Shrub; branches strigillose; petioles 6 to 9 mm. long; blades lanceolate, 4 to 6 cm. long, 1 to 1.5 cm. wide, acuminate, sharply serrate, scabrous on both sides; heads small, borne in numerous 5-headed terminal cymes; phyllaries ovate, acuminate, spreading-tipped. (Description compiled.)

24. *Perymenium ghiesbreghtii* Robins. & Greenm. *Proc. Amer. Acad.* 34: 525. 1899.

Chiapas.

Shrub 1 to 2 meters high; branches strigillose, glabrate; petioles 5 to 12 mm. long; blades lance-oblong, 6 to 11 cm. long, 1.5 to 3 cm. wide, acuminate, cuneate at base, serrate, smoothish above, appressed-hirsutulous beneath; heads in small close cymes; involucre about 5 mm. high, the phyllaries ovate, acuminate, with spreading tips.

25. *Perymenium croceum* Robins. & Greenm. *Proc. Amer. Acad.* 34: 527. 1899.

Durango.

Shrub; branches strigillose; petioles about 5 mm. long; blades lanceolate or lance-oblong, 5 to 9 cm. long, 1.3 to 1.8 cm. wide, acuminate, cuneate at base, serrate, green and rough above, densely and subcanescently strigillose beneath; heads in cymes of 3 to 5, short-pedicel; involucre 5 to 6 mm. high, the phyllaries obtuse or the outer acutish, appressed.

26. *Perymenium discolor* Schrad. "Ind. Sem. Hort. Gott. 1830;" *Linnaea* 6: Litt.-Ber. 73. 1831.

Oaxaca.

Shrub up to 5 meters high; branches strigose or strigillose; leaves short-petioled, lanceolate, 2 to 6.5 cm. long, 5 to 14 mm. wide, attenuate, acutely cuneate at base, green, scabrous, impressed-veined and somewhat rugose above, beneath densely and canescently subtomentose-hispidulous; heads in rounded panicles; involucre 4 mm. high, the phyllaries obtuse or rounded.

27. *Perymenium pellitum* Klatt, *Leopoldina* 23: 143. 1887.

Veraacruz and Oaxaca; type from Yavesia, Oaxaca.

Similar to *P. discolor*; leaves nigrescent in drying; heads usually in 3's, on pedicels 2 to 6 cm. long.

28. *Perymenium stenophyllum* Blake, Proc. Biol. Soc. Washington 32: 191. 1919.

Known only from the type locality, San Ignacio, Sinaloa.

Shrubby; branches strigose and strigillose; leaves short-petioled, narrowly linear, 3 to 15 cm. long, 1 to 4 mm. wide, acuminate at both ends, 1-nerved, roughish above, densely and finely canescent-tomentulose beneath; heads in terminal clusters of 3 to 7, the pedicels 3 to 40 mm. long; involucre 4 to (fruit) 7 mm. high, the phyllaries obtuse to rounded.

29. *Perymenium angustifolium* T. S. Brandeg. Zoe 5: 260. 1908.

Puebla; type from Cerro San Luis.

Shrub; branches strigose; leaves short-petioled, elliptic-lanceolate, 2 to 5 cm. long, 4 to 7 mm. wide, usually obtusish, cuneate at base, serrate, rough and rugose above, beneath densely and canescently or cinereously subtomentose-hispidulous; heads in small terminal cymes or cymose panicles; involucre 5 to 6 mm. high, the phyllaries acute or acuminate.

30. *Perymenium lasiolepis* Blake, Contr. U. S. Nat. Herb. 22: 625. 1924.

Known only from the type locality, San Simón, Puebla.

Shrub; branches spreading-hispidulous; leaves short-petioled, rhombic-ovate, 2 to 3.3 cm. long, 1 to 1.8 cm. wide, acutish, rounded-cuneate at base, hispid-pilose above, beneath densely and canescently pilose-tomentose; heads in rather small panicles; involucre 6 to 7 mm. high, the phyllaries lance-ovate, acuminate, spreading-tipped, densely pubescent.

31. *Perymenium blepharolepis* Blake, Proc. Amer. Acad. 51: 522. 1916.

Known only from the type locality, Coxcatlán, Puebla.

Shrub; branches strigillose; leaves short-petioled, ovate, 2.5 to 3.8 cm. long, 1 to 1.8 cm. wide, subacuminate, cuneate or rounded-cuneate at base, above strigillose, beneath subcanescently antrorse-hispid and hispidulous; heads 5 to 7, cymose-panicked; involucre 7 mm. high, the phyllaries ovate to lance-ovate, subacute.

32. *Perymenium hypoleucum* Blake, Proc. Amer. Acad. 51: 523. 1916.

Known definitely only from the type locality, San Luis Tultitlanapa, Puebla.

Shrub; branches strigillose; leaves short-petioled, ovate or elliptic-ovate, 2 to 3 cm. long, 1 to 2 cm. wide, obtuse to acute, cuneate-rounded at base, harsh above, densely and glaucescently subtomentose-hispidulous beneath; heads several, closely cymose-panicked; involucre 4 to 4.5 cm. high, the phyllaries densely strigillose, obtuse or rounded.

33. *Perymenium consobrinum* Blake, Contr. U. S. Nat. Herb. 22: 626. 1924.

Known only from the type locality, Los Naranjos, Oaxaca.

Shrubby; branches reflexed-hispidulous; leaves short-petioled, ovate or lance-ovate, 2.5 to 4 cm. long, 1.2 to 2 cm. wide, acute, cuneate at base, roughish and rugose above, beneath densely and subtomentosely hispid-pilose with glaucescent hairs; heads about 5, in umbelliform cymes, on pedicels 1 to 5 cm. long; involucre about 6 mm. high, the phyllaries obtuse, with spreading herbaceous tips.

34. *Perymenium collinum* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 395. 1909.

Known only from the type locality, Cerro de Gentile, Puebla.

Shrub; branches subtomentose-pilulous with spreading hairs; leaves short-petioled, broadly ovate, 1 to 1.8 cm. long, 8 to 14 mm. wide, acute, at base rounded or subcordate, harsh above, densely and ochroleucously subtomentose-hispidulous beneath; heads 3 to 5, short-pedicled; involucre 7 mm. high, the phyllaries ovate, obtuse, pubescent.

35. *Perymenium ovatum* T. S. Brandeg. Zoe 5: 261. 1908.

Known only from the type locality, Barranca de Tlaquilostlo, Puebla.

Small shrub; branches strigose or short-hispid; leaves short-petioled, ovate, 1.5 to 3 cm. long, 0.8 to 1.5 cm. wide, obtuse, serrate, rugose and scabrous above, densely subtomentose-hispidulous with bluish white hairs beneath; heads 1 to 3, terminating the branches, the pedicels 0.5 to 2.5 cm. long; involucre 7 to 8 mm. high, the phyllaries ovate to oblong, obtuse or the outer acutish, pubescent and ciliate.

36. *Perymenium acuminatum* (Llave) Blake, Contr. U. S. Nat. Herb. 22: 627. 1924.

Oleiza acuminata Llave, Reg. Trim. 1: 41. 1832.

Calea elegans DC. Prodr. 5: 674. 1836.

San Luis Potosí and State of Mexico.

Suffrutescent; stem glabrous or sparsely pubescent; leaves sessile or very short-petioled, lance-ovate or ovate, 3 to 6 cm. long, 1.2 to 2.8 cm. wide, acuminate, rounded to subcordate at base, callous-denticulate or subentire, smooth above, strigose or antrorse-hirsute on the veins beneath; heads 2 to 3.5 cm. wide, few on very long peduncles, or several and closely cymose-paniced; rays white; involucre 7 to 9 mm. high, the phyllaries many-nerved, with subscarios, often purplish tips, the outer acute, the inner obtuse or rounded.

37. *Perymenium macrocephalum* Greenm. Proc. Amer. Acad. 39: 108. 1903. Guerrero; type from Iguala.

Herbaceous or suffrutescent (?), 1 to 2 meters high; stem slender, strigillose or hispidulous; petioles of the larger leaves 1 to 3 cm. long; blades ovate, 6 to 12 cm. long, 3.5 to 7 cm. wide, acuminate, rounded to subcordate at base, serrate, rough above, hispid and hispidulous beneath chiefly on the veins; heads few, large, on pedicels 2 to 8.5 cm. long; involucre 7 to 9 mm. high.

38. *Perymenium nelsonii* Robins. & Greenm. Proc. Amer. Acad. 34: 529. 1899.

Chiapas; type collected between San Cristóbal and Teopisca.

Shrub; branches strigose to sordidly subtomentose; petioles 1.2 to 2 cm. long; blades ovate, 6 to 10 cm. long, 3.2 to 5.5 cm. wide, acuminate, rounded or subcordate at base, serrate, rough above, rather densely pilosulous to subtomentose beneath; heads cymose or cymose-paniced, large, about 3 cm. wide; involucre 8 to 11 mm. high, the phyllaries obtuse or rounded.

39. *Perymenium latisquamum* Blake, Contr. U. S. Nat. Herb. 22: 626. 1924.

Chiapas; type from Sierra de Tonalá. El Salvador.

Probably shrubby; stem strigillose; petioles 8 to 27 mm. long; blades broadly ovate, 6 to 13 cm. long, 4.5 to 7.5 cm. wide, acuminate, cuneate to subtruncate at base, serrate, roughish above, strigose or antrorse-hispid, chiefly along the veins, beneath and more or less gland-dotted; heads rather numerous, large, about 2.8 cm. wide; involucre 8 to 10 mm. high, the phyllaries broadly ovate (outermost) to broadly oval or suborbicular, broadly rounded or the outermost obtuse. "Tatascamito" (El Salvador).

DOUBTFUL SPECIES.

PERYMENIUM BARCLAYANUM DC. Prodr. 5: 609. 1836. Described as suffruticose and subscaudent. According to Robinson & Greenman, it is very close to *P. tenellum* A. Gray, an herbaceous species.

PERYMENIUM CERVANTESII DC. Prodr. 5: 609. 1836. This may be the same as *P. rude* Robins. & Greenm.

PERYMENIUM GYMNOLOMOIDES (Less.) DC. Prodr. 5: 609. 1836. *Lipotriche gymnomoides* Less. Linnaea 6: 408. 1831. Imperfectly described; type from Misantla, Veracruz.

65. **FLOURENSIA** DC. Prodr. 5: 592. 1836.

REFERENCE: Blake, Revision of the genus *Flourensia*, Contr. U. S. Nat. Herb. 20: 393-409. 1921.

Resinous shrubs; leaves alternate; heads yellow, radiate or discoid; involucre 2 to 4-seriate, the phyllaries herbaceous or subherbaceous; rays neutral; achenes more or less thickened; pappus of 2 awns and rarely a few squamellae.

Heads discoid.

Leaves entire.

Leaves ovate to obovate, 2 to 6 cm. wide.....1. **F. laurifolia**.

Leaves 4 to 11.5 mm. wide.

Leaves narrowly lanceolate, 4 to 7.5 mm. wide.....2. **F. retinophylla**.

Leaves ovate to oval, 6.5 to 11.5 mm. wide.....3. **F. cernua**.

Leaves mucronate-dentate.....4. **F. ilicifolia**.

Heads radiate.

Young branches densely pilose-lanate; heads numerous, in regular cymose panicles.....5. **F. glutinosa**.

Young branches not pilose-lanate; heads solitary to several at tips of branches, not regularly cymose-panicled.

Petioles 7 to 15 mm. long; leaf blades ovate, 6 to 10 cm. long.

6. **F. collodes**.

Petioles 1 to 4 mm. long; leaf blades oblong to lanceolate, or if ovate only 1.5 to 2.5 cm. long.

Phyllaries 13 to 23 mm. long, with ovate or lanceolate base and elongate linear-attenuate tips.....7. **F. pringlei**.

Phyllaries 7 to 15 mm. long, without linear-attenuate tips.

Leaf blades oblong-elliptic to lanceolate, 3.3 to 6.5 cm. long.

8. **F. resinosa**.

Leaf blades ovate or elliptic-ovate, 1.5 to 2.5 cm. long.

9. **F. microphylla**.

1. **Flourensia laurifolia** DC. Prodr. 5: 592. 1836.

Helianthus laurifolius Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 179. 1881.

Tamaulipas and San Luis Potosí; type collected between Victoria and Tula, Tamaulipas.

Shrub 1.5 to 3 meters high; leaf blades 5.5 to 13 cm. long; heads in cymose panicles of 3 to 7, the disk 1 to 1.3 cm. thick in flower.

2. **Flourensia retinophylla** Blake in Robinson, Proc. Amer. Acad. 49: 505. 1913.

Known only from the type locality, Sierra de la Paila, Coahuila.

Much-branched low viscid shrub; leaf blades 2.5 to 3.5 cm. long; heads 1 to 1.3 cm. high.

3. **Flourensia cernua** DC. Prodr. 5: 593. 1836.

Helianthus cernuus Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 179. 1881.

Sonora to Nuevo León, south to Zacatecas and San Luis Potosí; type collected between Monterrey and Lampasos, Nuevo León. Texas to Arizona.

Much-branched shrub 1 to 2 meters high, erect or procumbent; leaf blades 1.7 to 2.5 cm. long; heads nodding, solitary in the leaf axils, forming long leafy inflorescences. "Hojasé," "hojasén."

This shrub has a hoplike odor and a bitter taste. The leaves and heads are commonly sold in the markets of northern Mexico, and are taken as a remedy for indigestion. According to Palmer, it is employed also as a remedy for female diseases. In the United States the plant is known most commonly as "tar-bush."

4. *Flourensia ilicifolia* T. S. Brandeg. *Zoe* 5: 238. 1906.

Known only from the type locality, Sierra de Parras, Coahuila.

Shrub, much branched; leaf blades rhombic-ovate, 1.6 to 2.4 cm. long, coarsely dentate; heads 1.3 to 1.6 cm. high.

5. *Flourensia glutinosa* (Robins. & Greenm.) Blake, *Proc. Amer. Acad.* 49: 374. 1913.

Encelia glutinosa Robins. & Greenm. *Amer. Journ. Sci.* III. 50: 155. 1895.

Puebla and Oaxaca; type from Las Hoyas Canyon, Oaxaca.

Shrub 3 to 5 meters high; leaf blades ovate to ovate-lanceolate, 6.5 to 9 cm. long, entire; heads about 2.5 cm. wide.

It is perhaps this plant for which Dr. Reko reports the name of "raíz del manso."

6. *Flourensia collodes* (Greenm.) Blake, *Proc. Amer. Acad.* 49: 373. 1913.

Encelia collodes Greenm. *Proc. Amer. Acad.* 39: 110. 1903.

Known only from the type locality, between Ocuilapa and Tuxtla, Chiapas.

Shrub; leaves entire; heads 4 to 5 toward tips of branches, 4 cm. wide.

7. *Flourensia pringlei* (A. Gray) Blake, *Proc. Amer. Acad.* 49: 375. 1913.

Helianthella pringlei A. Gray, *Proc. Amer. Acad.* 21: 389. 1886.

Encelia oblonga Robins. & Fern. *Proc. Amer. Acad.* 30: 118. 1894.

Chihuahua and Durango; type from Chihuahua City.

Stems numerous, suffrutescent, 30 to 40 cm. high, very leafy; leaf blades elliptic-oblong to oblong-lanceolate, 3.2 to 10 cm. long; heads solitary, terminal, long-peduncled, 2.5 to 4 cm. wide.

8. *Flourensia resinosa* (T. S. Brandeg.) Blake, *Proc. Amer. Acad.* 49: 375. 1913.

Encelia resinosa T. S. Brandeg. *Zoe* 5: 240. 1906.

Known only from the type locality, Ixmiquilpan, Hidalgo.

Shrub, very glutinous; heads 1 to 4, long-peduncled, 3.5 to 5.3 cm. wide.

9. *Flourensia microphylla* (A. Gray) Blake, *Proc. Amer. Acad.* 49: 374. 1913.

Encelia microphylla A. Gray, *Proc. Amer. Acad.* 15: 37. 1879.

Coahuila; type from Saltillo.

Much-branched shrub about 1 meter high; heads solitary, long-peduncled, about 2.5 cm. wide.

66. **SALMEA** DC. *Cat. Hort. Monsp.* 140. 1813.

REFERENCE: Blake, A revision of *Salmea* and some allied genera, *Journ. Bot. Brit. & For.* 53: 193-201. 1915.

Shrubs, often scandent; leaves opposite; heads small, whitish, discoid, cymose-panicled; involucre about 3-seriate, graduate; receptacle conic; achenes strongly compressed, ciliate; pappus of 2 awns.

Heads very numerous, cymose-panicled on widely spreading, axillary and terminal branches.....1. **S. scandens**.

Heads few to numerous, on erect peduncles or several-headed flowering-branches.

Heads numerous, on 3 to 11-headed peduncles.....2. **S. palmeri**.

Heads few (5 to 11), on 1 to 3-headed peduncles.....3. **S. oligocephala**.

1. *Salmea scandens* (L.) DC. *Cat. Hort. Monsp.* 141. 1813.

Bidens scandens L. *Sp. Pl.* 833. 1753.

Salmea eupatoria DC. *Cat. Hort. Monsp.* 141. 1813.

Spilanthes nitidus Llave in Llave & Lex. *Nov. Veg. Descr.* 1: 28. 1824.

Salmea grandiceps Cass. *Dict. Sci. Nat.* 47: 88. 1827.

Salmea parviceps Cass. *Dict. Sci. Nat.* 47: 88. 1827.

Salmea oppositiceps Cass. *Dict. Sci. Nat.* 47: 89. 1827.

Fornicaria scandens Raf. Sylv. Tell. 116. 1838.

Verbesina scandens Klatt, Leopoldina 25: 106. 1889.

Tamaulipas and Guerrero to Chiapas; type from Veracruz. Guatemala to South America; West Indies.

Scandent shrub, up to 10 meters high; leaf blades ovate to oblong-ovate, 5 to 12.5 cm. long, 2 to 6 cm. wide, remotely serrulate or subentire, coriaceous, shining, essentially glabrous; heads 4.5 to 7 mm. high; phyllaries ovate to ovate-lanceolate, acute to acuminate; corollas white, turning greenish when old. "Hierba de San Antonio" (Puebla, Veracruz); "duerme-boca," "salta-afuera" (El Salvador); "oreja de conejo" (Honduras); "tabacón," "bejuco de muela" (Porto Rico).

The root of this plant, when chewed, is said to deaden all sensation in the tongue, hence the name "duerme-boca" applied in El Salvador. The name "bejuco de muela," reported from Porto Rico, would indicate that because of this property the plant is employed there as a remedy for toothache. The name "salta-afuera" used in El Salvador is an allusion to the fact that the vine is used there as a fish poison or barbasco, as which it is reported to be unusually efficient.

1a. *Salmea scandens obtusata* Blake, Journ. Bot. Brit. & For. 53: 197. 1915. Veracruz. Guatemala; type from Cobán.

Phyllaries oval, rounded; otherwise as in the typical form.

2. *Salmea palmeri* S. Wats. Proc. Amer. Acad. 26: 141. 1891.

Jalisco and Michoacán; type from Río Blanco, Jalisco.

Erect, about 50 cm. high; stem hirsutulous or strigillose, glabrate, erect-branched; leaf blades ovate to oval, 4.5 to 10 cm. long, repand-denticulate; heads 7 to 9 mm. high; phyllaries pubescent, with short loose subherbaceous tips.

3. *Salmea oligocephala* Hemsl. Biol. Centr. Amer. Bot. 2: 194. 1881.

Mexico; type from Zimapán, Hidalgo.

Erect; stem strigillose, the inflorescence hispidulous; leaf blades ovate to ovate-oblong, 4.8 to 9 cm. long; heads 9 to 11 mm. high; phyllaries pubescent, with narrow appressed subherbaceous tips.

67. NOTOPTERA Urban, Symb. Ant. 2: 465. 1901.

REFERENCE: Blake, Journ. Bot. Brit. & For. 53: 202, 225-229. 1915.

Shrubs; leaves opposite; heads radiate or discoid, cymose-panicled, the rays yellow, the disk yellow or white; involucre graduate, the phyllaries indurate, usually subherbaceous at apex; rays styliferous; achenes of disk strongly compressed, winged on one or both margins; pappus of 2 unequal awns, without squamellae, the inner awn broadly winged, the outer shorter, nearly or quite wingless.

Heads discoid.

Corollas erect; leaves obtuse or rounded.....1. *N. gaumeri*.

Corollas strongly reflexed at maturity; leaves acuminate.

Heads subcylindric, 7.5 to 10 mm. high; achene wings ciliolate.

2. *N. leptocephala*.

Heads campanulate or turbinate-campanulate, 4 to 7 mm. high; achene wings not ciliolate.

Pedicels 4 to 10 mm. long.....3. *N. scabridula*.

Pedicels 1 to 3 mm. long.....4. *N. brevipes*.

Heads radiate.

Heads numerous; involucre 4 mm. high.....5. *N. tequilana*.

Heads few; involucre 8 mm. high.....6. *N. epaleacea*.

1. *Notoptera gaumeri* Greenm. Field. Mus. Bot. 2: 269. 1907.

Salmea gaumeri Greenm. in Millsp. & Chase, Field Mus. Bot. 3: 124. 1904.

Yucatán; type from Izamal.

Shrub 6 meters high; leaf blades oval-ovate, 5 to 7 cm. long, 3 to 4 cm. wide, grayish-tomentose beneath; heads sessile, about 15-flowered, white, very aromatic. (Description compiled.)

2. *Notoptera leptcephala* Blake, Proc. Biol. Soc. Washington **34**: 46. 1921. Yucatán; type from Xnocac.

Shrub 3 meters high or less; leaf blades ovate or elliptic-ovate, 5.5 to 8.5 cm. long, 2 to 3.5 cm. wide, denticulate, rough above, densely hispidulous-pilosulous beneath; pedicels 1 to 4 mm. long; heads subcylindric when young.

This species is said to be used medicinally.

3. *Notoptera scabridula* Blake, Journ. Bot. Brit. & For. **53**: 226. 1915.

Veraacruz, Yucatán, Campeche, and Oaxaca; type from Atoyac, Veraacruz. Guatemala and Honduras.

Scandent shrub 5 meters high, with widespreading branchlets; leaf blades ovate or oblong-ovate, 5 to 12.5 cm. long, 2 to 6 cm. wide, rough above, rather densely pilosulous beneath; corollas whitish.

4. *Notoptera brevipes* (Robinson) Blake, Journ. Bot. Brit. & For. **53**: 227. 1915.

Otopappus brevipes Robinson, Proc. Amer. Acad. **44**: 621. 1909.

Chiapas (type locality). Guatemala and Honduras.

Scandent shrub; leaf blades ovate or oblong-ovate, 6.5 to 13.5 cm. long, densely reticulate beneath; pedicels short and thick.

5. *Notoptera tequilana* (A. Gray) Blake, Journ. Bot. Brit. & For. **53**: 228. 1915.

Zexmenia tequilana A. Gray in S. Wats. Proc. Amer. Acad. **22**: 425. 1887.

Otopappus tequilanus Robinson, Proc. Amer. Acad. **44**: 622. 1909.

Jalisco and Michoacán or Guerrero; type from Tequila, Jalisco.

Shrub, sometimes scandent, about 2 meters high; stem tuberculate-strigillose; leaf blades ovate or lance-ovate, acuminate, harsh-pubescent on both sides; heads yellow, about 1.5 cm. wide, in axillary and terminal cymose panicles.

5a. *Notoptera tequilana acuminata* (S. Wats.) Blake, Journ. Bot. Brit. & For. **53**: 228. 1915.

Otopappus acuminatus S. Wats. Proc. Amer. Acad. **26**: 140. 1891.

Otopappus tequilanus acuminatus Robinson, Proc. Amer. Acad. **44**: 622. 1909.

Jalisco; type from Guadalajara.

Stem strigose-pilose or hispid-pilose; leaves densely and rather softly pubescent beneath.

6. *Notoptera epaleacea* (Hemsl.) Blake, Journ. Bot. Brit. & For. **53**: 229. 1915.

Otopappus epaleaceus Hemsl. Biol. Centr. Amer. Bot. **2**: 191. 1881.

Morelos; type from Mexico, without definite locality.

Shrubby; stem strigillose; leaf blades ovate, acuminate or acute, harshly pubescent on both sides; heads about 2.5 cm. wide, solitary on axillary and terminal peduncles 0.8 to 5 cm. long.

68. *ENCELIA* Adans. (Fam. Pl. **2**: 128. 1763, hyponym); Lam. Encycl. **2**: 356. 1786.

REFERENCE: Blake, A revision of *Encelia* and some related genera, Proc. Amer. Acad. **49**: 358-376. pl. 1. 1913.

Herbs or shrubs with alternate leaves and solitary to paniced, radiate heads; rays yellow; disk yellow or purple; involucre 2 or 3-seriate; rays neutral; achenes strongly compressed, very flat, oblong or obovate, narrowly white-margined, villous-ciliate; pappus none or of 2 slender awns.

Leaves laciniately lobed.

Leaves with linear rachis and lobes.....1. *E. ventorum*.

Leaves ovate or obovate in outline, the lobes lanceolate.....2. *E. laciniata*.

Leaves entire or toothed.

Leaves linear or linear-filiform.....8. *E. stenophylla*.

Leaves oblong to ovate.

Heads numerous, paniced; peduncles and pedicels glabrous, rarely with a few hairs.....3. *E. farinosa*.

Heads few or solitary; peduncles pubescent.

Disk yellow.....4. *E. albescens*.

Disk purple or brownish purple.

Phyllaries densely pubescent on back as well as on margin.

5. *E. californica*.

Phyllaries conspicuously ciliate, on back glabrous to rather sparsely hispidulous or pubescent.

Leaves cinereous-pubescent, usually cordate or subcordate at base.

6. *E. palmeri*.

Leaves green, cuneate to truncate at base.....7. *E. halimifolia*.

1. *Encelia ventorum* T. S. Brandeg. Proc. Calif. Acad. II. 2: 175. 1889.

Baja California; type from Boca de las Animas.

Shrub about 1 meter high, much branched; leaves 3 to 6.5 cm. long, fleshy, the rachis and the 1 to 5 lobes linear, 1 to 2 mm. wide; heads about 1.7 cm. wide, nodding, fragrant, resinous.

2. *Encelia laciniata* Vasey & Rose, Proc. U. S. Nat. Mus. 11: 535. 1889.

Baja California; type from Lagoon Head.

Shrubby, 60 to 90 cm. high, usually hispid; leaves 3 to 5.5 cm. long, ovate or obovate in outline, unequally laciniate-lobed, the lamina 2.5 to 6 mm. wide between the lobes.

3. *Encelia farinosa* A. Gray in Emory, Mil. Recon. 143. 1848.

Sonora and Sinaloa. Nevada to California and Arizona; type from California.

Shrubby below, 1.6 meters high or less, resinous; stem white-farinose, glabrescent; leaf blades broadly ovate to lanceolate, 3 to 10 cm. long, entire or subentire, white-farinose, sometimes glabrescent; heads about 2.5 cm. wide; disk yellow. "Hierba ceniza" (Sinaloa); "inciense" (Baja California); "palo blanco," "hierba de las ánimas" (Sonora); "hierba del bazo" (Arizona).

The shrub is very abundant in some parts of Sonora, and is gathered for use as firewood. A resin obtained from the stems is sometimes used as incense in churches. The plant has sometimes been mistaken for guayule (*Parthenium argentatum*). The Indians chewed the gum and used it as a varnish for arrows and other objects. The gum also was melted and smeared on the body as a relief for pain in the sides.

3a. *Encelia farinosa phenicodonta* Blake, Proc. Amer. Acad. 49: 362. 1913.

Baja California and Sonora; type from San Quintín, Baja California. California and Arizona.

Disk purple; otherwise as in the typical form. "Inciense" (Baja California).

The resin is burned for incense in the churches of Baja California.

3b. *Encelia farinosa radians* T. S. Brandeg.; Blake, Proc. Amer. Acad. 49: 362. 1913.

Encelia radians T. S. Brandeg. Proc. Calif. Acad. II. 2: 176. 1889.

Cape region of Baja California; type from San Gregorio.

Leaves soon glabrate; involucre essentially glabrous; disk purple.

4. *Encelia albescens* A. Gray, Proc. Amer. Acad. 8: 658. 1873.

Known only from the type locality, somewhere in Sonora.

Frutescent (?); branches rough-pubescent, bearing single pedunculate heads; branch leaves ovate, 2 to 2.5 cm. long, subentire, harshly whitish-pubescent with appressed hairs; heads about 3.5 cm. wide.

A doubtful species, known from a single collection.

5. *Encelia californica* Nutt. Trans. Amer. Phil. Soc. n. ser. 7: 357. 1841.

Northern Baja California. California and Arizona; type from Santa Barbara, California.

Frutescent below, up to 3.5 meters high; stem and peduncles cinereous with fine, chiefly incurved hairs; leaf blades ovate to lanceolate, entire or subentire, green, 3 to 6 cm. long; peduncles elongate; heads about 4 cm. wide.

5a. *Encelia californica asperifolia* Blake, Proc. Amer. Acad. 49: 368. 1913.

Baja California and islands; type from Cedros Island.

Smaller and more woody; leaves smaller, the blades 1 to 3 cm. long, scabrid-pubescent; heads smaller.

6. *Encelia palmeri* Vasey & Rose, Proc. U. S. Nat. Mus. 11: 535. 1889.

Baja California; type from Lagoon Head.

Shrubby below, 1 meter high or less, canescent-hispidulous on the younger parts; leaf blades ovate to rotund-ovate, 1.5 to 4 cm. long, nearly or quite as wide, entire or bluntly toothed; heads 2.5 to 4 cm. wide. "Mirasol" (Baja California).

7. *Encelia halimifolia* Cav. Icon. Pl. 3: 6. pl. 210. 1795.

Pallasia grandiflora Willd. Sp. Pl. 3: 2261. 1804.

Encelia conspersa Benth. Bot. Voy. Sulph. 26. 1844.

Sonora and Baja California; type from Mexico, without definite locality.

Shrubby below; branches strigillose or hispidulous; leaf blades ovate or oblong-ovate, 2 to 4 cm. long, entire, cuneate to truncate at base; heads 1.5 to 2.8 cm. wide; phyllaries densely white-ciliate.

8. *Encelia stenophylla* Greene, Bull. Torrey Club 10: 41. 1883.

Known only from the type locality, Cedros Island, Baja California.

Suffrutescent, about 30 cm. high, glutinous; leaves crowded on the lower part of the stems, narrowly linear, 1-nerved, 2.5 to 8 cm. long, 1 to 2 mm. wide; heads numerous, cymose-panicled, yellow, about 1.5 cm. wide; achenes silky-villous, 2-awned.

69. **HYMENOSTEPHIUM** Benth. (in Benth. & Hook. Gen. Pl. 2: 382. 1873, hyponym); in Hook. Icon. Pl. 12: 48. pl. 1154. 1873.

Suffrutescent or herbaceous; leaves (in ours) ovate, petioled, mostly opposite; heads cymose or cymose-panicled, small or medium, radiate, yellow; involucre 2 or 3-seriate, graduate or subequal, the phyllaries ovate or lance-ovate, usually without conspicuously herbaceous tips; achenes obovoid, somewhat compressed, pubescent or glabrous; pappus of few unequal squamellae without awns, or none.

Disk in anthesis 8 to 13 mm. thick; involucre 5 to 6 mm. high, the phyllaries ovate, their tips herbaceous, gradually acuminate.....4. **H. superaxillare**.

Disk in anthesis usually less than 8 mm. thick; involucre usually 4 mm. high or less, the phyllaries mostly lance-ovate, with attenuate or very narrowly acuminate tips, these obscurely if at all herbaceous.

Heads in anthesis subcylindric, the disk usually about 3 mm. thick; pubescence of the stem usually appressed.....1. **H. microcephalum**.

Heads in anthesis campanulate, the disk usually 5 to 8 mm. thick.

Pubescence of stem and under leaf surface copious, spreading.

2. **H. guatemalense**.

Pubescence of stem and under leaf surface sparse, appressed.

3. **H. cordatum**.

1. *Hymenostephium microcephalum* (Less.) Blake, Contr. Gray Herb. n. ser. 54: 8. 1918.

Gymnolomia microcephala Less. Linnaea 5: 153. 1830.

Hymenostephium mexicanum Benth. in Hook. Icon. Pl. 12: 48. pl. 1154. 1873.

Montanoa thomasi Klatt, Abh. Naturf. Ges. Halle 15: 328. 1882.

?*Gymnolomia chrenbergiana* Klatt, Leopoldina 23: 90. 1887.

?*Microcephalum chrenbergianum* Schultz Bip.; Klatt, Leopoldina 23: 90. 1887, as synonym.

Gymnolomia patens abbreviata Robins. & Greenm. Proc. Bost. Soc. Nat. Hist. 29: 94. 1899.

San Luis Potosí to Oaxaca; type from Hacienda de la Laguna, Veracruz. Guatemala.

Suffrutescent or herbaceous, 1 meter high or more; stem slender, strigose or strigillose; petioles slender, mostly 1 to 3 cm. long; blades ovate, 4 to 11 cm. long, 1.5 to 7 cm. wide, acuminate, usually subcordate at base, serrate; heads usually numerous, in rather close cymes or cymose panicles; involucre 2-seriate, 2 to 4 mm. high, the phyllaries mostly lance-ovate, with short, very narrow, mostly spreading tips; achenes glabrous or pubescent; pappus none or of few unequal squamellae.

2. *Hymenostephium guatemalense* (Robins. & Greenm.) Blake, Contr. Gray Herb. n. ser. 54: 8. 1918.

Gymnolomia patens guatemalensis Robins. & Greenm. Proc. Bost. Soc. Nat. Hist. 29: 94. 1899.

Gymnolomia patens brachypoda Robins. & Greenm. Proc. Bost. Soc. Nat. Hist. 29: 95. 1899.

Gymnolomia guatemalensis Greenm. Field Mus. Bot. 2: 347. 1912.

Hymenostephium pilosulum Blake, Journ. Bot. Brit. & For. 53: 268. 1915.

Oaxaca. Guatemala to Panama; type from San Miguel Uspantán, Guatemala.

Suffrutescent or herbaceous, up to 2.6 meters high; stem densely and sordidly spreading-pilose or pilosulous; leaves as in *H. microcephalum*, but rather densely spreading-pilose or hirsute beneath; heads broadly campanulate in anthesis; involucre 4 to 6 mm. high; achenes and pappus as in no. 1.

3. *Hymenostephium cordatum* (Hook. & Arn.) Blake, Journ. Bot. Brit. & For. 53: 268. 1915.

Wedelia cordata Hook. & Arn. Bot. Beechey Voy. 435. 1840-41.

Wedelia subflexuosa Hook. & Arn. Bot. Beechey Voy. 435. 1840-41.

Gymnopsis? *costaricensis* Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 90. 1852.

Gymnopsis vulcanica Steetz in Seem. Bot. Voy. Herald 157. 1853-54.

Gymnolomia patens A. Gray, Proc. Amer. Acad. 5: 182. 1861.

Gymnolomia subflexuosa Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 163. 1881.

Aspilia costaricensis Klatt, Bull. Soc. Bot. Belg. 31: 201. 1892, as to synonym.

Montanoa serrata Rusby, Descr. New S. Amer. Pl. 151. 1920.

San Luis Potosí and Oaxaca. Guatemala to Panama and Colombia; type from Realejo, Nicaragua.

Suffrutescent, 3 to 5 meters high, or herbaceous, erect to reclining or subscandent; stem usually sparsely strigillose; leaves as in no 1, often cuneate at base; heads and achenes as in no. 2. "Flor amarilla" (El Salvador); "árnica" (Guatemala).

4. *Hymenostephium superaxillare* Blake, Proc. Biol. Soc. Washington 37: 57. 1924.

Known only from the type locality, La Bajada, Tamazula, Durango.

Herbaceous, at least above; stem almost glabrous; branches superaxillary; leaves much as in no. 1; heads usually ternate, the peduncles 2.5 to 8 cm. long; involucre 3-seriate, the phyllaries ovate, acute or acuminate, the herbaceous tips usually spreading; achenes glabrous, epappose.

70. **PODACHAENIUM** Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 98. 1852.

REFERENCE: Blake, Contr. Gray Herb. n. ser. 52: 50. 1917.

1. **Podachaenium eminens** (Lag.) Schultz Bip. Flora 44: 557. 1861.

Ferdinandia eminens Lag. Gen. & Sp. Nov. 31. 1816.

Podachaenium paniculatum Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 99. 1852.

Dicalymma fragrans Lem. Ill. Hort. 2: Misc. 37. f. 1-3. 1855.

Cosmophyllum cacaliaefolium Koch & Bouché, Ind. Sem. Hort. Berol. 1854: 12. 1854; Walp. Ann. Bot. 5: 219. 1858.

Sinaloa to Veraacruz and Oaxaca; type from Mexico, without definite locality. Guatemala to Costa Rica.

Stout shrub, up to 8 meters high, sordid-tomentulose; leaves opposite, or the upper alternate, petioled; blades ovate to suborbicular, up to 30 cm. long and wide, entire or angulate-toothed or lobed, green above, griseous-tomentulose beneath; heads very numerous in a terminal panicle, 1.5 to 2.5 cm. wide; rays white, disk yellow; achenes compressed, about 2 mm. long, with whitish stipitiform base; pappus of 2 awns and several squamellae. "Tacote" (Sinaloa); "tora" (Costa Rica.)

In Sinaloa the fragrant leaves are applied as poultices to wounds.

71. **ACHAENIPODIUM** T. S. Brandeg. Zoe 5: 239. 1906.

1. **Achaenipodium discoideum** T. S. Brandeg. Zoe 5: 239. 1906.

Known only from the type locality, Mount Ixtaccihuatl, State of Mexico.

Suffrutescent; stem hirsute; leaves opposite, short-petioled, the blades lanceolate, 10 to 14 cm. long, 2 to 3 cm. wide, acuminate, serrate, penninerved, griseous-pilose beneath; heads paniced, yellow, discoid, about 7 mm. wide; achenes compressed, long-stipitate, about 5 mm. long, 1 mm. wide; pappus of 2 setiform awns.

72. **ZEXMENIA** Llave in Llave & Lex. Nov. Veg. Descr. 1: 13. 1824.

REFERENCE: W. W. Jones, A revision of the genus *Zexmenia*, Proc. Amer. Acad. 41: 143-167. 1905.

Shrubs or herbs; leaves opposite, rarely alternate, usually ovate, serrate, and petioled; heads solitary, umbellate-cymose, or paniced, radiate, yellow (the rays saffron in one species); involucre 2 to 5-seriate, graduate or subequal, the phyllaries usually ovate or oblong and with herbaceous tips; rays fertile; receptacle paleaceous; disk achenes more or less compressed, mostly oblong or obovate, acute-margined or sometimes winged; pappus of 2 or 3 awns and several usually more or less connate squamellae, the latter sometimes reduced to an entire crown or obsolete.

Heads solitary or ternate at tip of stem, long-peduncled; peduncles mostly 5 to 25 cm. long.

Leaves densely canescent-tomentose beneath.

Leaves toothed.....19. *Z. pringlei*.

Leaves entire.....20. *Z. gnaphalioides*.

Leaves not tomentose beneath.

Leaves smaller, not over 5 cm. long.

Leaves chiefly alternate, entire.....21. *Z. brevifolia*.

Leaves opposite, toothed.

Involucre several-seriate.....18. *Z. lantanifolia*.

Involucre 2-seriate.....22. *Z. strigosa*.

Leaves large, mostly 10 cm. long or more.

Leaves densely and rather softly appressed- or incurved-pilose beneath.

Awns continuous with the very narrow, winglike margins of the achene; phyllaries mostly oblong.....3. *Z. crocea*.

Awns not continuous with the margins of the achene; phyllaries lanceolate.....22. *Z. strigosa*.

Leaves sparsely and harshly strigillose, hispidulous, or hirsute beneath.

Outer phyllaries mostly oval or suborbicular, rounded or rarely acutish at apex.....1. *Z. ghiesbreghtii*.

Outer phyllaries ovate, usually acuminate.....2. *Z. greggii*.

Heads usually numerous in umbelliform cymes, or paniced, if sometimes ternate then on pedicels less than 5 cm. long (rarely up to 5.8 cm. in no. 7).

Leaves elliptic or elliptic-oblong, 1.5 cm. wide or less, strongly 3-nerved.

17. *Z. seemannii*.

Leaves ovate or lance-ovate, usually wider, triplinerved.

Petioles very short, 3 mm. long or less.

Branches hirsute-pilose with loosely spreading hairs; leaves shallowly cordate at base.....16. *Z. cordifolia*.

Branches strigose or strigillose; leaves rounded at base.

Heads 1 to 5, the pedicels mostly 2 to 5.8 cm. long...7. *Z. fruticosa*.

Heads numerous, the pedicels 1 to 2 cm. long...15. *Z. microcephala*.

Petioles of the main leaves more than 5 mm. long.

Heads numerous in close terminal umbelliform cymes or cymose panicles.

Heads larger, the disk in anthesis 7 to 10 mm. thick.

Pedicels usually 2 cm. long or less; petioles 1 cm. long or less.

5. *Z. michoacana*.

Pedicels usually over 2 cm. long; petioles 1 to 3.5 cm. long.

8. *Z. frutescens*.

Heads smaller, the disk in anthesis usually less than 5 mm. thick.

Phyllaries (at least the outer) acuminate or subacuminate, the tips usually spreading.

Involucre 9 to 10.5 mm. high; pedicels densely spreading-hirsute, 1.4 cm. long or less.....9. *Z. aggregata*.

Involucre 9 mm. high or less; pedicels strigose or strigillose, usually 2 to 5 cm. long.

Involucre 7 to 9 mm. high; heads 3 to 6.....10. *Z. gracilis*.

Involucre 6 mm. high or less; heads usually more numerous.

11. *Z. fasciculata*.

Phyllaries obtuse to broadly rounded (the outermost sometimes acute or acutish), the tips appressed.

Phyllaries (except the two outermost) all with very broadly rounded tips.....14. *Z. rotundata*.

Phyllaries obtuse or rarely acutish.

Awns longer than the body of the disk achenes, conspicuously exerted in the fruiting heads.....12. *Z. ceanothifolia*.

Awns shorter than the body of the disk achenes, not exerted in fruit.....13. *Z. gradata*.

Heads several or numerous and loosely paniced, or in terminal cymes of 3 to 5, not numerous and umbelled.

Involucre 8 to 15 mm. high, the outermost phyllaries with ovate base and abruptly narrower, equal or longer, spreading, herbaceous tips.....24. *Z. leucactis*.

Involucre shorter, or else the phyllaries not with ovate base and abruptly narrowed, long, herbaceous tips.

Involucre in anthesis 1 cm. thick or more; phyllaries broadly ovate or oval, with squarrose, herbaceous tips-----4. *Z. squarrosa*.

Involucre in anthesis less than 1 cm. thick; phyllaries usually ovate and without squarrose herbaceous tips.

Achenes with true wings-----23. *Z. scandens*.

Achenes not with true wings, but usually narrowly wing-margined.

Young branchlets densely spreading-hirsute-5. *Z. michoacana*.

Young branchlets sparsely strigose or nearly glabrous.

6. *Z. elegans*.

1. *Zexmenia ghiesbreghtii* A. Gray, Pl. Wright. 1: 113. 1852, as *Z. ghiesbreghtii*.

Sinaloa to Guerrero; type from Mexico, without definite locality.

Suffrutescent (?), 1.3 to 3 meters high; stem strigillose; leaves sessile, ovate or lance-ovate, mostly 9 to 13.5 cm. long, 2 to 5 cm. wide, acuminate, serrate or serrulate, rough on both sides; heads 1 to 5, terminal and in the upper axils, large; peduncles usually 5 to 18 cm. long; involucre 1.2 to 1.8 cm. high, strigose and strigillose. "Hierba del pasmo" (Sinaloa).

2. *Zexmenia greggii* A. Gray, Pl. Wright. 1: 113. 1852.

Jalisco; type collected "between the City of Mexico and Mazatlán."

Suffrutescent, 2 to 3.3 meters high, similar in most characters to *Z. ghiesbreghtii*; outer and middle phyllaries triangular-ovate, acuminate.

3. *Zexmenia crocea* A. Gray, Pl. Wright. 1: 114. 1852.

Zexmenia stenantha Hemsl. Biol. Centr. Amer. Bot. 2: 174. 1881.

Morelos to Michoacán and Oaxaca; type from Mexico, without definite locality.

Suffrutescent or truly shrubby, 0.6 to 2.5 meters high; younger branches and peduncles varying from densely pilose to strigose; petioles usually very short, sometimes 1 cm. long; blades ovate, the larger 5 to 10.5 cm. long, acuminate, usually subcordate at base, serrate, rough above, rather softly and densely griseous-pubescent beneath; involucre 1.5 to 2 cm. high, subequal or obgraduate, the phyllaries few, oblong or obovate, with long loose herbaceous tips; rays orange or reddish yellow.

4. *Zexmenia squarrosa* Greenm. in W. W. Jones, Proc. Amer. Acad. 41: 151. 1905.

Guerrero and Michoacán; type from mountains above Iguala, Guerrero.

Shrub 1 to 2 meters high; branches strigose or strigillose; petioles 1 to 1.5 cm. long; blades ovate, 4.5 to 7.5 cm. long, 2.5 to 6 cm. wide, acute or acuminate, cuneate at base, serrate, rough above and usually beneath; heads 1 to 5, cymose, on pedicels 4.5 cm. long or less; involucre 1.1 to 1.4 cm. high, the phyllaries strongly graduate, broadly suborbicular-ovate or oval, hirsute-pilose, with mostly obtuse squarrose herbaceous tips.

5. *Zexmenia michoacana* Blake, Contr. U. S. Nat. Herb. 22: 631. 1924.

Michoacán; type from Loma Santa María, near Morelia.

Shrub; branchlets densely hirsute-pilose with spreading hairs; petioles 2 to 10 mm. long; blades ovate, 5 to 10 cm. long, 2 to 5.5 cm. wide, broadly rounded to cuneate at base, rough or roughish on both sides; heads medium-sized, in umbellate clusters of 1 to 6, the pedicels spreading-hirsute-pilose, 1 to 3.5 cm. long; involucre 7 to 10 mm. high, the outer phyllaries mostly triangular-ovate, obtuse to subacuminate, herbaceous above, mostly appressed, the inner oblong or oval-oblong, rounded.

6. *Zexmenia elegans* Schultz Bip.; W. W. Jones, Proc. Amer. Acad. 41: 157. 1905.

Veraacruz; type from Mirador.

Shrub; branches sparsely erect-hirsute, glabrate; petioles 5 to 7 mm. long; blades ovate or lanceolate, 6 to 10 cm. long, 1.5 to 3 cm. wide, acuminate, cuneate at base, smoothish above, sparsely strigose on the veins beneath; heads ternate, the pedicels 8 to 22 mm. long; involucre 9 mm. high, the outermost phyllaries lanceolate or lance-ovate, acuminate, the inner broader, obtuse.

7. *Zexmenia fruticosa* Rose, Contr. U. S. Nat. Herb. 1: 103. 1891.

Known only from the type locality, Alamos, Sonora.

Shrub 2.5 meters high; branches sparsely strigillose; leaves short-petioled, lanceolate to ovate, 5 to 10 cm. long, 1.4 to 2.8 cm. wide, acuminate, serrate, scabrous, hispid beneath; heads 1 to 5, cymose, the pedicels 1.2 to 5.8 cm. long; involucre 8 to 10 mm. high, the outer phyllaries lanceolate or ovate, acute, strigose, the inner longer, strigillose and ciliate.

8. *Zexmenia frutescens* (Mill.) Blake, Contr. Gray Herb. n. ser. 52: 50. 1917.

Bidens fruticosa L. Sp. Pl. 833. 1753. Not *Zexmenia fruticosa* Rose, 1891.

Verbesina fruticosa L. Sp. Pl. ed. 2. 1271. 1763, in part.

Bidens frutescens Mill. Gard. Dict. ed. 8. *Bidens* no. 4. 1768.

Zexmenia costaricensis Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd.

1852: 95. 1852.

Zexmenia nicaraguensis C. Muell. in Walp. Ann. Bot. 5: 226. 1858.

Narvalina fruticosa Urban, Symb. Antill. 5: 265. 1907, as to name-bringing synonym only.

Zexmenia purpusii T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 75. 1914.

Zexmenia frutescens genuina Blake, Contr. Gray Herb. n. ser. 52: 51. 1917.

Chiapas. Guatemala to Panama; type from "Cartagena."

Shrubby or "arborescent," up to 8 meters high; branches glabrous or somewhat pubescent and glabrate; leaf blades ovate, 6 to 16 cm. long, 2 to 6.5 cm. wide, acuminate, cuneate at base, serrate, rough above, from nearly glabrous to strigose or hispidulous beneath; heads medium-sized, usually numerous in umbelliform cymes, the pedicels hispidulous, usually 2 to 5 cm. long; involucre 7 to 12 mm. high, few-seriate, subequal or somewhat graduate, the phyllaries mostly oblong and obtuse, the outer sometimes ovate and acute or acuminate. "Tisate" (El Salvador); "faciscón" (Guatemala).

In El Salvador the white ashes derived from the wood are used by spinning women to keep the fingers smooth. In Guatemala the plant is said to furnish a medicine for infantile fevers. The species has been reported from Yucatán with the name "sactah" or "zactah."

9. *Zexmenia aggregata* Blake, Contr. U. S. Nat. Herb. 22: 634. 1924.

Known only from the type locality, Santa Catarina, Oaxaca.

Shrub; branchlets densely spreading-hirsute; petioles 4 to 6 mm. long; blades ovate, 4 to 5.5 cm. long, 1.8 to 2.5 cm. wide, acuminate, cuneate at base, serrulate, rough above, rather softly hirsute-pilose beneath; heads in close umbelliform cymes, the pedicels densely spreading-hirsute, 1.4 cm. long or less; involucre 9 to 10.5 mm. high, the phyllaries subequal, lance-ovate, hispid-pilose, with acuminate herbaceous tips.

10. *Zexmenia gracilis* W. W. Jones, Proc. Amer. Acad. 41: 154. 1905.

Colima (type locality) and Michoacán or Guerrero.

Shrub 2 to 3 meters high; branches sparsely strigillose; petioles 1 to 1.5 cm. long; blades lanceolate to ovate, 5 to 11.5 cm. long, 2 to 4 cm. wide, acuminate, at base acuminate to rounded, serrate, sparsely tuberculate-strigose above, sparsely strigillose beneath; heads in terminal umbelliform cymes of 3 to 7, also solitary in the upper axils, the pedicels 1.5 to 8 cm. long, strigillose; involucre 7 to 9 mm. high, graduate, the outer and middle phyllaries lanceolate or lance-ovate, with mostly spreading, acuminate, herbaceous tips.

11. *Zexmenia fasciculata* (DC.) Schultz Bip. in Seem. Bot. Voy. Herald 306. 1856.

Lipochaeta fasciculata DC. Prodr. 5: 610. 1836.

Sinaloa and Chihuahua to Tamaulipas, south to Jalisco and San Luis Potosí; type from Tula, Tamaulipas.

Shrub; branches strigillose, glabrate; petioles mostly 1 to 2.2 cm. long; blades lanceolate to ovate, 6 to 14 cm. long, 1.5 to 6 cm. wide, acuminate, cuneate at base, serrate, rough above, sparsely to densely hispidulous or strigose beneath; heads small, usually numerous in umbelliform cymes, the pedicels strigose, 1 to 3 cm. long; involucre 5 to 6 mm. high, slightly graduate, the outer and middle phyllaries lance-ovate or ovate, with acuminate or subacuminate, loose, herbaceous tips.

12. *Zexmenia ceanothifolia* (Willd.) Schultz Bip. in Seem. Bot. Voy. Herald 305. 1856.

Verbesina ceanothifolia Willd. Sp. Pl. 3: 2225. 1804.

Lipochaeta umbellata DC. Prodr. 5: 610. 1836.

Jalisco and Guanajuato to Veracruz and Oaxaca; type from Acapulco, Guerrero.

Shrub 2 to 3.3 meters high; branches strigose, glabrate; petioles 3 to 12 mm. long; blades ovate to lance-oblong, 6 to 11.5 cm. long, 2 to 5 cm. wide, acuminate, cuneate at base, rough and rugose above, reticulate and strigillose to short-hispid beneath; heads as in *Z. fasciculata*; involucre 5 to 7 mm. high, strongly graduate, the phyllaries broadly ovate to oval, obtuse to merely acute or apiculate.

13. *Zexmenia gradata* Blake, Contr. U. S. Nat. Herb. 22: 632. 1924.

Sinaloa; type from Lodiago.

Shrub, up to 3 meters high; branches strigose or strigillose; petioles 4 to 12 mm. long; blades ovate to oblong-elliptic, 7 to 12.5 cm. long, 2.3 to 5.3 cm. wide, acuminate, at base cuneate to rounded-cuneate, rough above, beneath densely and rather softly hirsute-pilose on all the veins and veinlets, sometimes also between them, with usually spreading or divergent hairs; heads small, in umbelliform clusters, the pedicels strigillose, mostly 7 to 15 mm. long; involucre 6 to 7.5 mm. high, strongly graduate, the phyllaries ovate to broadly oval or suborbicular, obtuse to acute.

14. *Zexmenia rotundata* Blake, Contr. U. S. Nat. Herb. 22: 632. 1924.

Known only from the type locality, Huasemote, Durango.

Shrub; branchlets sparsely strigillose; petioles 6 to 8 mm. long; blades lance-ovate, 5.5 to 8 cm. long, 2 to 2.8 cm. wide, acuminate, cuneate at base, sparsely hirsute on both sides; heads small, in terminal umbelliform cymes of 3 to 6; involucre 8 to 9 mm. high, strongly graduate, the phyllaries suborbicular to oval, with rounded thin-herbaceous tips.

15. *Zexmenia microcephala* Hemsl. Biol. Centr. Amer. Bot. 2: 173. 1881.

Lipochaeta umbellata conferta DC. Prodr. 5: 610. 1836.

Zexmenia ceanothifolia conferta A. Gray; W. W. Jones, Proc. Amer. Acad. 41: 155. 1905.

Tepic and Morelos; type from San Blas, Tepic.

Shrub; branches strigose, glabrate; leaves sessile, oblong or oval-elliptic to ovate or lance-ovate, 3.5 to 10 cm. long, 1.5 to 3.8 cm. wide, acute, at base rounded, smoothish above, strigillose beneath; heads numerous in close umbelliform cymes or cymose panicles, the pedicels strigillose, 1 to 2 cm. long; involucre campanulate, 6 to 8 mm. high, graduate, the phyllaries oblong or oval, obtuse or apiculate, or the outermost acute.

16. *Zexmenia cordifolia* Blake, Contr. U. S. Nat. Herb. 22: 633. 1924.

Known only from the type locality, near Acaponeta, Tepic.

Shrub; branches densely sordid-pilose with spreading hairs, glabrate; leaves subsessile, ovate, 5 to 6 cm. long, 2.8 to 3.5 cm. wide, acute, shallowly cordate at base, roughish above, strigose and strigillose beneath; heads small, in umbelliform cymes; pedicels 6 to 27 mm. long; involucre 8 mm. high, strongly graduate, the phyllaries ovate to oval, appressed, the outermost acute, the others obtuse.

17. *Zexmenia seemannii* A. Gray, Pl. Wright. 1: 114. 1852.

Sonora, Sinaloa, Durango, and Tepic; type from Cerro de Pinal, Sinaloa.

Shrub about 1 meter high; branches strigillose; petioles 3 to 10 mm. long; blades linear-elliptic to linear-oblong or oblong-lanceolate, 4 to 10 cm. long, 7 to 15 mm. wide, obtuse to acuminate, cuneate at base, strongly 3-nerved, shining, sparsely strigose or strigillose; heads medium-sized, in terminal umbelliform cymes of 3 to 5, the pedicels 12 mm. long or usually less; involucre 1 to 1.2 cm. high, strongly graduate, the phyllaries mostly suborbicular-oval to oblong, the rounded outer and middle ones with short, thick-herbaceous, rather loose tips.

18. *Zexmenia lantanifolia* (Schauer) Schultz Bip. in Seem. Bot. Voy. Herald 306. 1856.

Lipochaeta lantanifolia Schauer, *Linnaea* 19: 729. 1847.

Tamaulipas and San Luis Potosí to Hidalgo; type from Zimapán, Hidalgo.

Shrub; branchlets spreading or ascending-hispidulous, glabrate; petioles 5 to 10 mm. long; blades ovate, 1.8 to 4.5 cm. long, 1 to 2.8 cm. wide, acute, cuneate to truncate or subcordate at base, rough above, hirsute or hispid and often griseous beneath; heads solitary, leafy-bracted, rather large, the peduncles 2.5 to 7.5 cm. long; proper involucre 8 to 10 mm. high, campanulate-subglobose, the phyllaries ovate to lance-oblong, mostly acute or acuminate, the outer with usually appressed herbaceous tips.

19. *Zexmenia pringlei* Greenm. Proc. Amer. Acad. 33: 489. 1898.

Puebla; type from Tehuacán.

Shrub; branchlets canescently arachnoid-tomentose, glabrescent; petioles about 5 mm. long; blades deltoid-ovate, 1.3 to 3.5 cm. long, 1 to 2.5 cm. wide, acute or obtuse, cordate at base, rugose and green above, canescently lanate-tomentose beneath; heads solitary, rather large, leafy-bracted, the peduncles 5 to 17 cm. long; proper involucre about 10 mm. high, the inner phyllaries oblong, acute or acuminate, arachnoid-ciliate.

20. *Zexmenia gnaphalioides* A. Gray, Proc. Amer. Acad. 15: 36. 1879.

Known only from the type locality, between San Luis Potosí and Tampico.

Shrub, floccose-lanate; leaves short-petioled, deltoid-ovate or cordate-lanceolate, 1.2 to 1.8 cm. long, acute, entire, revolute-margined, above sericeous-hispidulous, beneath pannose-tomentose; heads solitary, about 1.2 cm. thick, leafy-bracted, on long peduncles; phyllaries oblong to linear, obtuse, appressed. (Description compiled.)

21. *Zexmenia brevifolia* A. Gray, Pl. Wright. 1: 112. 1852.

Chihuahua and Coahuila, south to Zacatacas and San Luis Potosí. Texas; type collected between the Limpio and Rio Grande.

Shrub about 1 meter high, cinereously strigillose or retrorse-hispidulous; leaves short-petioled, suborbicular to ovate, 1.8 cm. long and 1.3 cm. wide or smaller, obtuse or rounded, broadly rounded to subcordate at base, entire, harshly tuberculate-strigillose or hispidulous; heads medium-sized, solitary, long-peduncled; involucre 6 to 10 mm. high, subequal or graduate, the outer and middle phyllaries mostly obovate or spatulate, the tips herbaceous, spreading.

22. *Zexmenia strigosa* (DC.) Schultz Bip. in Seem. Bot. Voy. Herald 306. 1856.

Lipochaeta strigosa DC. *Prodr.* 5: 610. 1836.

Known only from the type locality, near Tehuantepec, Oaxaca.

Suffruticose; branches nearly glabrous; leaves short-petioled, lance-ovate, acuminate, serrulate, sparsely strigose above, appressed-villous beneath; peduncles monocephalous; involucre 2-seriate, the outer phyllaries foliaceous, strigose; achenes slender, 5 to 7 mm. long. (Description compiled.)

23. *Zexmenia scandens* Hemsl. Biol. Centr. Amer. Bot. **2**: 174. 1881.

Zexmenia trachylepis Hemsl. Biol. Centr. Amer. Bot. **2**: 175. 1881.

Zexmenia dulcis Coulter, Bot. Gaz. **16**: 99. 1891.

Verbesina sylvicola T. S. Brandeg. Univ. Calif. Publ. Bot. **10**: 419. 1924.

Veracruz and Tabasco to Chiapas; type from Valley of Córdoba, Veracruz. Guatemala.

Shrub, scandent or subscandent; branches sordidly tomentose-pilose or hispid-pilose; petioles 5 to 15 mm. long; blades ovate or oblong-ovate, 7.5 to 11.5 cm. long, 3 to 5 cm. wide, acuminate or acute, rounded or cuneate-rounded at base, serrate, rough above, sordidly hirsute-pilose or hispid beneath; heads usually numerous and cymose-panicled, sometimes in cymes of 1 to 3, medium-sized, the pedicels usually 1 to 5 cm. long; involucre 5 to 7 mm. high, subequal or graduate, the phyllaries mostly ovate to oblong or oval, obtuse or sometimes acute, with short, often spreading, subherbaceous tips; achenes winged.

24. *Zexmenia leucactis* Blake, Journ. Bot. Brit. & For. **53**: 307. 1915.

Zexmenia chiapensis T. S. Brandeg. Univ. Calif. Publ. Bot. **6**: 197. 1915.

Chiapas. Guatemala; type from Retahuleu.

Shrub about 2.5 meters high; branches densely sordid-pilose, glabrate; petioles 7 to 15 mm. long; blades ovate or oblong-ovate, 6 to 11 cm. long, 2.8 to 4 cm. wide, acuminate, cuneate or rounded at base, serrate, harsh above, densely and softly griseous-pilosulous beneath; heads medium-sized, few, loosely cymose, the pedicels sordid-pilose, 1 to 4 cm. long; rays yellow; involucre about 3-seriate, obgraduate, the outermost phyllaries with ovate base and much narrower and longer, loosely spreading, acuminate, herbaceous tips, the innermost much shorter, unappendaged; achenes winged.

DOUBTFUL SPECIES.

ZEXMENIA IMBRICATA Schultz Bip. in Seem. Bot. Voy. Herald 306. 1856.

Mexico, without definite locality.

Suffruticose, canescent, the stem glabrescent; petioles 1.6 cm. long; blades triangular-ovate, 10 cm. long, 5 cm. wide and more, acute, subcordate at base, dentate, scabrous; heads in the upper axils, about equaling the pedicels; involucre 6 mm. high, graduate, the phyllaries ovate-linear, obtuse, scabrous; achenes winged. (Description compiled.)

ZEXMENIA LINDENII Schultz Bip. in Seem. Bot. Voy. Herald 306. 1856.

Lasianthaea lindenii Schultz Bip. in Seem. Bot. Voy. Herald 306. 1856, as synonym.

Known only from the type locality, Mirador, Veracruz.

Leaves alternate, elliptic-lanceolate, 9 cm. long, 1.8 to 2.5 cm. wide, attenuate at each end, petioled, serrate, featherveined, harsh above, tomentose beneath; heads numerous. (Description compiled.)

Perhaps a species of *Verbesina*.

ZEXMENIA MACROCEPHALA (Hook. & Arn.) Hemsl. Biol. Centr. Amer. Bot. **2**: 173. 1881.

Lipochaeta macrocephala Hook. & Arn. Bot. Beechey Voy. 436. 1840-41.

Closely allied to *Z. ghiesbreghtii* A. Gray, and perhaps identical; type from Tepic.

ZEXMENIA MONOCEPHALA (DC.) Heynh. Nomencl. **2**: 772. 1846.

Lipochaeta monocephala DC. Prodr. **5**: 610. 1836.

Mexico, without definite locality (type); Veracruz (according to W. W. Jones).

Shrub; stem glabrous; petioles 5 to 13 mm. long, villous; blades lance-ovate, 2 to 10 cm. long, 0.5 to 5 cm. wide, acuminate, rounded or acutish at base, serrate, scabrous above, sparsely strigillose beneath; peduncles solitary, monocephalous, shorter than the upper leaves; heads 15 mm. high; involucre campanulate, 1 to 1.5 cm. wide, the phyllaries about 2-seriate, few, ovate, submembranaceous; achenes margined; squamellae well developed. (Description compiled.)

ZEXMENIA SERRATA Llave in Llave & Lex. Nov. Veg. Descr. 1: 13. 1824.

Known only from the type locality, San José del Corral, Mexico.

Sarmentose shrub 4 meters high; branches pubescent; leaves opposite, petioled, sublanceolate, serrate, rough on both sides, the younger pubescent beneath; heads in umbelliform cymes; involucre 2-seriate, the phyllaries few, ovate, recurved at apex; rays 10 to 12. (Description compiled.)

73. OTOPAPPUS Benth. (in Benth. & Hook. Gen. Pl. 2: 380. 1873, hyponym)
in Hook. Icon. Pl. 12: 47. *pl. 1153*. 1873.

REFERENCE: Blake, Journ. Bot. Brit. & For. 53: 229-235. 1915.

Shrubs; leaves opposite; heads radiate or discoid, yellow; involucre 3 to 6-seriate, graduate, the phyllaries indurate, often herbaceous-tipped; rays when present fertile; achenes compressed, 2-winged, the wings decurrent on the awns, the inner much larger; pappus of 2 awns and a lacperate corona of connate squamellae.

Heads radiate.

Leaves strigillose but smooth to the touch above, the hairs not tuberculate-based.

Pedicels 1 to 3 cm. long.....1. *O. verbesinoides*.

Pedicels 2 to 7 mm. long.

Outer phyllaries with conspicuous, spreading or reflexed, spatulate, herbaceous tips.....2. *O. trinervis*.

Outer phyllaries without conspicuous spatulate herbaceous tips.

4. *O. microcephalus*.

Leaves rough above with tuberculate-based hairs.

Branches and pedicels densely spreading-hispidulous.....6. *O. pringlei*.

Branches and pedicels strigillose.

Rays 1 cm. long; outer phyllaries with spreading or reflexed, spatulate, herbaceous tips 5 to 13 mm. long.....5. *O. scaber*.

Rays 2 to 6 mm. long; outer phyllaries without conspicuous spatulate herbaceous tips.

Heads 1.2 to 1.5 cm. wide.....3. *O. salazari*.

Heads 6.5 to 8 mm. wide.....4. *O. microcephalus*.

Heads discoid.

Leaves 3 to 5.5 cm. long; branches hispidulous.....7. *O. xanthocarpus*.

Leaves 6.5 to 13.5 cm. long; branches loosely pilose.....8. *O. robustus*.

1. Otopappus verbesinoides Benth. in Hook. Icon. Pl. 12: 47. *pl. 1153*. 1873.
Perymenium sartori Schultz Bip.; Klatt, Leopoldina 23: 144. 1887, as synonym.

Veracruz and Chiapas. Guatemala to Costa Rica; type from Chontales, Nicaragua.

Scandent or straggling shrub; stem strigillose; leaf blades ovate to lance-ovate or oblong-elliptic, 7 to 18 cm. long, 1.8 to 4.5 cm. wide, repand-dentate to serrulate, acuminate; heads 1.5 to 2.3 cm. wide, in cymose panicles of 3 to 5 at tips of stem and branches, or solitary in the upper axils; outer phyllaries with reflexed, linear to spatulate, herbaceous tips.

2. Otopappus trinervis Blake, Journ. Bot. Brit. & For. 53: 231. 1915.

Known only from the type locality, Finca Irlanda, Chiapas.

Branching shrub; stem strigillose; leaf blades oblong-ovate or ovate-lanceolate, 7 to 11 cm. long, obscurely serrulate; heads 1 cm. wide; rays very small; outer phyllaries with spreading spatulate tips.

3. *Otopappus salazari* Blake, Proc. Biol. Soc. Washington 32: 192. 1919.

Southern Sinaloa; type from Ixtagua.

Scandent shrub; stem strigillose; leaf blades lance-ovate, 9.5 to 12 cm. long, 2.5 to 4 cm. wide, denticulate, slightly rough-strigillose above with somewhat tuberculate-based hairs; heads about 13 in a ternately divided panicle; phyllaries with slightly spreading apex; rays about 5 mm. long.

4. *Otopappus microcephalus* Blake, Journ. Bot. Brit. & For. 53: 232. 1915.

Colima and Guerrero; type from Manzanillo, Colima.

Shrub 2 to 3 meters high; stem strigillose; leaf blades ovate, 4.5 to 9 cm. long, rough or roughish above; heads rather numerous, cymose-panicled; phyllaries with small spreading herbaceous tips; rays about 2 mm. long.

5. *Otopappus scaber* Blake, Contr. U. S. Nat. Herb. 22: 636. 1924.

Known only from the type locality, Apazote, near Yohaltún, Campeche.

Apparently scandent; leaf blades oblong-ovate, 5 to 9 cm. long, 2 to 3.5 cm. wide, serrulate, rough on both sides; heads and involucre much as in *O. verbesinoides*, 2.7 to 3 cm. wide.

6. *Otopappus pringlei* (Greenm.) Blake, Journ. Bot. Brit. & For. 53: 232. 1915.

Otopappus epaleaceus pringlei Greenm. Proc. Amer. Acad. 40: 42. 1904.

Morelos and Guerrero; type from Cuernavaca, Morelos.

Shrub; leaf blades ovate, 4.5 to 7.5 cm. long, dentate, very harsh above, rather densely hispidulous and strongly prominulous-reticulate beneath; heads 1 to 1.2 cm. wide, in terminal cymes of 5 to 7; phyllaries with minute herbaceous tips; rays about 2 mm. long.

7. *Otopappus xanthocarphus* T. S. Brandeg. Univ. Calif. Publ. Bot. 3: 394. 1909.

Known only from the type locality, Cerro de Castillo, near Zapotitlán, Puebla.

Trichotomously branched shrub; leaf blades ovate or ovate-oblong, 1.2 to 2.7 cm. wide, acute, serrate-dentate, very rough above, roughish-hispidulous beneath; heads about 1 cm. thick, in terminal 3 or 5-headed cymes; involucre 5 mm. high, the outer phyllaries herbaceous.

8. *Otopappus robustus* Hemsl. Biol. Centr. Amer. Bot. 2: 191. pl. 49. 1881.

Zexmenia robusta O. Hoffm. in Engl. & Prantl, Pflanzenfam. 4²: 230. f. 116, O. 1890.

Known only from the type locality, Valley of Córdoba, Veracruz.

Scandent shrub; leaf blades ovate, acuminate, roughish above, densely and rather softly pilosulous beneath; heads rather numerous, cymose-panicled; involucre 6 to 7 mm. high.

74. OYEDAEA DC. Prodr. 5: 576. 1836.

REFERENCE: Blake, Revision of the genus *Oyedaea*, Contr. U. S. Nat. Herb. 20: 411-422. 1921.

1. *Oyedaea ovalifolia* A. Gray, Proc. Amer. Acad. 5: 183. 1861.

Oyedaea ampeloides Hemsl. Biol. Centr. Amer. Bot. 2: 176. 1881.

Veracruz and San Luis Potosí; type from Huautla, Veracruz.

Reclining or scandent shrub, 3 to 6 meters long or more; stem strigillose, glabrate; leaf blades oval to ovate, 8 to 18.5 cm. long, 5 to 8 cm. wide, acute or obtuse, crenate-mucronulate, harshly strigillose above, strigillose beneath, on petioles 5 to 17 mm. long; heads 3 to 5.5 cm. wide, radiate, yellow, several or numerous in an open panicle; involucre 3-seriate, 4 to 5.5 mm. high, of triangular-ovate to oval indurate phyllaries; rays neutral; achenes compressed, 2-winged; pappus of 2 slender awns and about 10 basally united squamellae.

75. *VERBESINA* L. Sp. Pl. 901. 1753.

REFERENCE: Robinson & Greenman, Synopsis of the genus *Verbesina*, with an analytical key to the species, Proc. Amer. Acad. 34: 534-566. 1899.

Shrubs or herbs; leaves opposite or alternate; heads radiate or discoid, solitary to numerous and paniced, usually yellow, sometimes orange or white; involucre usually about 2-seriate, the phyllaries usually unequal and more or less herbaceous; rays usually fertile; achenes strongly compressed, 2-winged; pappus of 2 awns, very rarely wanting.

Rays white or none.

Rays none.

Stem winged; heads many-flowered.

Leaves dentate, the larger usually sinuately lobed or pinnatifid; phyllaries ovate to linear-lanceolate..... 1. *V. crocata*.

Leaves serrulate, ovate; phyllaries ovate to oblong.... 2. *V. ovatifolia*.

Stem wingless; heads 7 to 9-flowered.

Leaves lance-oblong..... 59. *V. pauciflora*.

Leaves ovate or elliptic-ovate..... 60. *V. oligantha*.

Rays present, white.

Stem densely puberulous or subtomentose-pubescent.

Stem winged nearly or quite to the inflorescence.... 56. *V. turbacensis*.

Stem wingless.

Leaves dentate; heads few; phyllaries broadly ovate.

27. *V. auriculata*.

Leaves sinuate-lobed; heads numerous; phyllaries linear to oblanceolate.

55. *V. sublobata*.

Stem glabrous or sparsely puberulous, usually glaucous or glaucescent.

Internodes winged throughout..... 57. *V. hypsela*.

Internodes and whole stem wingless..... 58. *V. gigantoides*.

Rays present, yellow.

Lamina of the rays 1 to 2.5 cm. long.

Leaf bases decurrent, forming wings on the stem.

Larger leaves sinuately 3-lobed; disk about 2 cm. thick.... 5. *V. klattii*.

Leaves unlobed; disk much smaller.

Leaves very finely and closely canescent beneath with appressed hairs.

19. *V. neriifolia*.

Leaves rather loosely griseous- or canescent-tomentose or merely puberulent beneath.

Leaves sessile.

Leaves coarsely dentate..... 14. *V. coahuilensis*.

Leaves subentire..... 21. *V. petrophila*.

Leaves short-petioled.

Leaves canescently pilose-tomentose beneath... 20. *V. gracilipes*.

Leaves green and merely puberulent beneath... 22. *V. liebmannii*.

Leaf bases not decurrent, the stem wingless.

Leaves canescent-tomentose or finely canescent-sericeous beneath.

Leaves sessile, amplexicaul..... 15. *V. hypoleuca*.

Leaves petioled, not amplexicaul.

Leaves densely pilose-tomentose beneath..... 20. *V. gracilipes*.

Leaves not densely pilose-tomentose beneath.

Leaves very finely and densely canescent-sericeous beneath; involucre 4 to 5 mm. high..... 18. *V. hypoglauca*.

Leaves not densely canescent-sericeous beneath; involucre 5 to 8 mm. high.

Heads long-peduncled; leaf blades lanceolate to ovate, 2 to 7 cm. long..... 12. *V. chihuahuensis*.

- Heads on peduncles 2 cm. long or less; leaf blades rhombic-ovate, widest near middle, about 10 cm. long.—17. *V. intermissa*.
Leaves green or griseous-pubescent beneath.
- Leaves lanceolate to oval-ovate, narrowed to both ends from near the middle.
- Leaves sessile, entire.....21. *V. petrophila*.
Leaves petioled, serrate or serrulate.
- Leaves griseously subtomentose-pilose beneath; disk in anthesis about twice as high as thick.....16. *V. sororia*.
Leaves merely puberulous, strigillose, or strigose beneath; disk in anthesis as thick or thicker than high.
- Involucre 7 to 8 mm. high.....17. *V. intermissa*.
Involucre 3 to 5 mm. high.....22. *V. liebmannii*.
- Leaves chiefly ovate, broad at base or only shortly cuneate.
- Leaves sessile or subsessile, or on short, broadly winged, clasping petioles.
- Leaves on broadly winged auriculate-clasping petioles.
7. *V. palmeri*.
- Leaves sessile or subsessile.
- Leaves chiefly obovate; disk about 1 cm. thick.
21. *V. petrophila*.
- Leaves ovate; disk more than 1 cm. thick.
- Leaves entire or subentire.....6. *V. dissita*.
Leaves coarsely toothed.....10. *V. peninsularis*.
- Leaves slender-petioled.
- Leaves dull green, not conspicuously reticulate; phyllaries linear to lanceolate.....12. *V. chihuahuensis*.
Leaves bright green, conspicuously reticulate on both sides; phyllaries oval to obovate.....13. *V. hastata*.
- Lamina of the rays less than 1 cm. long.
- A. Stem more or less winged, or else leaves auriculate at base.
- Stem wingless; leaves auriculate at base.
- Leaves entire or subentire, canescent-tomentose beneath, lanceolate.
25. *V. potosina*.
- Leaves serrate or serrulate, usually green beneath.
- Leaves abruptly contracted into broadly winged auriculate-amplexicaul petioles.....7. *V. palmeri*.
- Leaves gradually narrowed to base.
- Leaves distinctly petioled, the petioles with deciduous auricles at base.
- Leaves strigillose to pilose beneath, chiefly on the veins; pales with spreading or reflexed cuspidate tips.
22. *V. liebmannii*.
- Leaves tomentose-pilosulous beneath; pales blunt or with short erect mucros.....31. *V. oncophora*.
- Leaves sessile or subsessile.
- Leaves distinctly pubescent or tomentose beneath.
- Leaves 2.5 to 15 cm. long, 0.8 to 2.5 cm. wide.
- Leaves about 4 cm. long, acute.....15. *V. hypoleuca*.
Leaves 5 to 15 cm. long, attenuate.....26. *V. oreopola*.
Leaves 18 to 27.5 cm. long, 5 to 11 cm. wide.
27. *V. auriculata*.
- Leaves glabrous or sparsely strigillose on the costa beneath.
- Leaves oblong, 3.7 to 5 cm. wide.....23. *V. nelsonii*.
Leaves lanceolate, 1 to 1.3 cm. wide.....24. *V. otophylla*.

Stem winged.

Leaves densely silky-tomentose beneath.....30. *V. mollis*.

Leaves not silky-tomentose beneath.

Leaves alternate.

Leaves tomentose or tomentulose beneath.

Leaves unlobed.....28. *V. acapulcensis*.

Leaves palmately 3-lobed.....51. *V. fastigiata*.

Leaves subglabrous to puberulent beneath.

Involucre 2 mm. high; stem densely spreading-hispidulous.

47. *V. cymbipalea*.

Involucre 3 to 6 mm. high; stem usually strigillose or erectish-hispidulous.

Leaves oblong, 15 to 20 cm. long, 3.7 to 5 cm. wide.

23. *V. nelsonii*.

Leaves much smaller.

Petioles 2 to 15 mm. long; leaves usually rhombic-ovate.

22. *V. liebmännii*.

Petioles very short or none; leaves lanceolate or lance-oblong.....32. *V. virgata*.

Leaves chiefly opposite.

Leaves unlobed; phyllaries mostly squarrose-tipped; disk 6 to 10 mm. thick or more.

Leaves strigillose beneath.....29. *V. xanthochlora*.

Leaves hispidulous or pilosulous beneath.

Leaves chiefly ovate; disk in anthesis 1 cm. thick or more.

3. *V. sphaerocephala*.

Leaves oblong-lanceolate; disk in anthesis about 6 mm. thick.

4. *V. langlassei*.

Leaves usually 3-lobed or pinnatifid; phyllaries mostly appressed; disk 3 to 6 mm. thick.

Stem broadly winged; phyllaries mostly acute or acuminate.

52. *V. greenmani*.

Stem narrowly winged; phyllaries obtuse.

53. *V. montanoifolia*.

AA. Stem wingless; leaves not auriculate at base.

B. Leaves chiefly opposite.

Leaves bright green, shining at least above, subcoriaceous.

Young branches white-tomentose.....8. *V. oligocephala*.

Young branches not tomentose.....13. *V. hastata*.

Leaves usually dull green, not subcoriaceous.

Leaves trilobate; heads subcylindric in anthesis....54. *V. trilobata*.

Leaves not trilobate; heads broader.

Leaves lance-oblong, about 4 times as long as wide, griseous or canescent beneath.

Leaves finely canescent-strigillose beneath...18. *V. hypoglauca*.

Leaves tomentose or tomentulose beneath.

Leaves tomentulose and prominently reticulate beneath.

36. *V. grayii*.

Leaves tomentose and not prominently reticulate beneath.

37. *V. molinaria*.

Leaves chiefly ovate or lance-ovate, usually much less than 4 times as long as wide.

Heads solitary or few, on usually elongate peduncles.

Branchlets white-tomentose at apex.....8. *V. oligocephala*.

- Branchlets not white-tomentose at apex.
 Leaves hirsute with subappressed hairs.....11. *V. erosa*.
 Leaves scabrous-hispidulous.
 Leaves opposite essentially throughout, serrate.
 9. *V. leptochaeta*.
 Leaves alternate above, coarsely toothed.
 10. *V. peninsularis*.
- Heads usually numerous, in close cymes or panicles.
 Heads subeylindric when young.
 Heads 2 to 4; rays about 12.....8. *V. oligocephala*.
 Heads 4 to 10; rays about 2.....35. *V. luisana*.
 Heads campanulate or subglobose.
 Leaves serrate, dentate, or laciniate-lobed, usually densely
 pubescent beneath.....33. *V. serrata*.
 Leaves serrulate, green and sparsely pubescent beneath.
 34. *V. resinosa*.
- BB. Leaves alternate.
 Leaves very densely and finely silvery-strigillose beneath.
 42. *V. hypargyrea*.
 Leaves not silvery-strigillose beneath.
 Heads larger, in fruit 1 to 1.5 cm. thick.
 Leaves green and essentially glabrous beneath, except for the
 strigose or strigillose costa and veins....43. *V. persicifolia*.
 Leaves more or less pubescent on the surface as well as the veins
 beneath.
 Involucre 7 to 10 mm. high.
 Leaves canescent-tomentose beneath....38. *V. robinsonii*.
 Leaves green and finely hispidulous beneath.
 10. *V. peninsularis*.
- Involucre 6 mm. high or less (rarely higher in *V. olivacea*).
 Fruiting pales with cuspidate, mostly recurved tips.
 Leaves green and not subtomentose beneath.
 22. *V. liebmannii*.
 Leaves cinerascently subtomentose beneath.
 40. *V. cinerascens*.
- Fruiting pales rarely cuspidate, not recurved at tip.
 Leaves sessile, obovate-lanceolate; pales acute; pedicels
 thick and very short.....41. *V. crassipes*.
 Leaves usually petioled, lanceolate to lance-oblong; pales
 acute or obtuse; pedicels mostly slender, not very short.
 Pales and phyllaries obtuse or merely acutish; involucre
 5 to 7.5 mm. high.....44. *V. olivacea*.
 Pales abruptly short-pointed; involucre 3 to 4 mm. high.
 Leaves 1 to 2.5 cm. wide.....26. *V. oreopola*.
 Leaves 3.2 to 6 cm. wide.....39. *V. chiapensis*.
- Heads smaller, in fruit usually 5 to 7 mm. thick.
 Tips of the pales recurved, at least in fruit.
 Branches glabrous; leaves glabrescent beneath.
 45. *V. seemannii*.
 Branches densely hispidulous or pilosulous; leaves rather densely
 hispidulous or pilosulous beneath.
 Leaves cinerascently subtomentose-pilosulous beneath.
 40. *V. cinerascens*.

Leaves hispidulous beneath.

Leaves lanceolate, 1.4 to 2.2 cm. wide; petioles 1 to 2 mm. long-----46. *V. angustifolia*.

Leaves lance-elliptic, 1.5 to 4 cm. wide; petioles 3 to 6 mm. long-----47. *V. cymbipalea*.

Tips of the pales not recurved.

Leaves strigillose beneath-----50. *V. ortegae*.

Leaves hispidulous or pilosulous beneath.

Leaves very rough above; pedicels spreading-pubescent.

48. *V. abscondita*.

Leaves smooth or smoothish above; pedicels appressed-pubescent-----49. *V. perymenioides*.

1. *Verbesina crocata* (Cav.) Less.; DC. Prodr. 5: 617. 1836.

Bidens crocata Cav. Icon. Pl. 1: 66. pl. 99. 1791.

Spilanthes crocata Sims in Curtis's Bot. Mag. 39-40: pl. 1627. 1814.

Platypterus crocata H. B. K. Nov. Gen. & Sp. 4: 201. 1820.

Tepic to Veraacruz and Oaxaca; type from Mexico, without definite locality.

Shrubby, sometimes scandent, 2 to 5 meters high, hispidulous or hirsutulous; stems with 4 herbaceous wings; leaves opposite, ovate in outline, the lower or sometimes all deeply pinnatifid, usually 10 to 23 cm. long, the petioles broadly winged; heads few to numerous, long-peduncled, orange-red, 1.5 to 3 cm. thick; involucre graduate. "Capitaneja," "nahuitiput" (*Urbina*).

The plant is reported to be used a remedy for wounds.

2. *Verbesina ovatifolia* A. Gray, Proc. Amer. Acad. 19: 15. 1883.

Known only from the type locality, Chiapas.

Suffrutescent (?), 2.6 to 3.3 meters high, scabrous; leaves ovate, acute, subsessile, denticulate; heads subcymose, short-peduncled, about 1.2 cm. high; phyllaries small, ovate or oblong, appressed. (Description compiled.)

3. *Verbesina sphaerocephala* A. Gray in S. Wats. Proc. Amer. Acad. 22: 428. 1887.

Jalisco and Colima; type from Guadalajara, Jalisco.

Suffrutescent, 2 meters high, hispidulous to pilosulous; stem narrowly 4-winged; leaves opposite, ovate or rhombic-ovate, 7.5 to 14.5 cm. long, 3 to 6 cm. wide, acute or acuminate, subsessile, serrate, rough above, hispidulous or pilosulous beneath; heads few at apex of stem and branches, short-pedicled; involucre 7 to 11 mm. high, graduate, the phyllaries mostly oval or oblong, all but the innermost with blunt squarrose herbaceous tips.

4. *Verbesina langlassei* Robinson, Proc. Amer. Acad. 44: 621. 1909.

Known only from the type locality, Sierra Madre of Michoacán or Guerrero.

Similar to *V. sphaerocephala*; leaves lance-oblong, 8 to 13 cm. long, 2.5 to 3.2 cm. wide; heads rather numerous, cymose-panicled at tips of stem and branches; involucre about 6 mm. high, the outer phyllaries broadly obovate, herbaceous, scarcely squarrose.

5. *Verbesina klattii* Robins. & Greenm. Proc. Amer. Acad. 34: 538. 1899.

Verbesina heterophylla Klatt, "Arbeit. Bot. Mus. Hamb. 1892-93: 3. 1893."

Not *V. heterophylla* A. Gray, 1883.

Known only from the type locality, mountains near Pátzcuaro, Michoacán.

Suffrutescent, 1.5 to 3.5 meters high, hirsutulous; stem rather broadly winged; leaves alternate, ovate or rhombic-ovate in outline, 10 to 22 cm. long (including the broadly winged petiole), 4 to 11 cm. wide, the larger 3-lobed, denticulate, rough above; heads few, short-pedicled, large; involucre 1 to 1.2 cm. high, the phyllaries ovate to suborbicular, obtuse or obtusish, herbaceous, subequal; rays about 1.4 cm. long.

6. *Verbesina dissita* A. Gray, Proc. Amer. Acad. 20: 299. 1885.

Northern Baja California; type from Todos Santos Bay.

Suffrutescent; stem sparsely strigillose or hispidulous, rather remotely leafy; leaves opposite below, alternate above, ovate, 4 to 5 cm. long, acute, at least the upper sessile and auriculate-clasping at base, entire or remotely denticulate; heads several, large, the disk about 2 cm. wide, the pedicels 2 to 12.5 cm. long; involucre about 1 cm. high, graduate, the phyllaries oblong or obovate, obtuse or rounded, appressed; rays 1.2 to 2 cm. long.

7. *Verbesina palmeri* S. Wats. Proc. Amer. Acad. 24: 56. 1889.

Known only from the type locality, Los Angeles Bay, Baja California.

Suffruticose, about 1.3 meters high, forming large clumps, hispid-scabrous throughout with mostly deciduous spreading hairs with persistent tuberculate bases; leaves opposite; petioles 0.5 to 1.5 cm. long, very broadly winged, auriculate-clasping; blades deltoid-ovate, 3 to 7 cm. long, 2.5 to 4.8 wide, coarsely dentate; heads rather numerous, cymose-panicled, the pedicels 1.5 to 5.5 cm. long; involucre 5 to 6 mm. high, 2-seriate, the phyllaries oblong, obtuse or rounded, with somewhat squarrose herbaceous tips; rays 6 to 10 mm. long.

8. *Verbesina oligocephala* I. M. Johnston, Proc. Calif. Acad. IV. 12: 1200. 1924.

Known only from the type locality, Agua Verde Bay, Baja California.

Shrub about 1 meter high; branchlets white-tomentose; leaves opposite; petioles winged, 5 to 8 mm. long; blades ovate or lance-ovate, 4 to 7 cm. long, acute, cuneate or rounded at base, light green, tuberculate-scabrous; heads 2 to 4 in a terminal cyme hidden by the leaves, the pedicels 4 to 11 mm. long; involucre 3 to 4 mm. high, the phyllaries 2-seriate, ovate-oblong, obtuse, with spreading herbaceous tips; rays orange-yellow, about 6 mm. long. (Description compiled.)

9. *Verbesina leptochaeta* A. Gray, Proc. Amer. Acad. 21: 389. 1886.

Known only from the type locality, near Batopilas, Chihuahua.

Shrubby, 1.5 to 2.5 meters high; leaves opposite, those of the stem deltoid, 10 to 12.5 cm. long, serrate, hispidulous-scabrous, abruptly narrowed into a long narrowly winged petiole; heads subsolitary, rather large; outer phyllaries narrowly oblong, spreading, herbaceous; rays small. (Description compiled.)

10. *Verbesina peninsularis* Blake, Proc. Biol. Soc. Washington 37: 58. 1924.

Known only from the type locality, 20 miles east of San Ignacio, Baja California.

Suffrutescent or fruticose; stem finely hispidulous-pilous; leaves opposite below, alternate above; blades triangular-ovate, 9 to 11 cm. long, 4.5 to 5.5 cm. wide, acuminate, cuneately decurrent to the base of the short petiole, coarsely toothed, somewhat hastate-lobed at base, green and hispidulous on both sides, the hairs especially of the upper surface tuberculate-based; heads about 10, the pedicels 1 to 8 cm. long; involucre 7 to 8 mm. high, the phyllaries herbaceous, oblong-ovate, acutish to obtuse, erect; rays about 1 cm. long.

11. *Verbesina erosa* T. S. Brandeg. Proc. Calif. Acad. II. 3: 146. 1891.

Baja California; type from Sierra de San Francisquito.

Suffrutescent; stem spreading-hirsute or hirsutulous; leaves opposite below, alternate above, ovate or lance-ovate, the larger 8 to 11 cm. long, 3 to 7 cm. wide, acuminate, subsessile or on winged petioles 1.8 cm. long or less, sharply serrate or the upper subentire, rough above, hirsute or hirsute-pilose with antrorse hairs beneath; heads few, the pedicels 1 to 8 cm. long; involucre 6 to 8 mm. high, the phyllaries chiefly lanceolate or linear, acute or acuminate.

12. *Verbesina chihuahuensis* A. Gray, Proc. Amer. Acad. 21: 389. 1886.

Verbesina parrasana T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 191. 1911.

Sonora, Chihuahua, Coahuila, and Durango; type from Santa Eulalia Mountains, near Chihuahua.

Shrubby; stem and leaves hispidulous or spreading-pilosulous, sometimes subsericeously appressed-pilose; leaves opposite below, alternate above; petioles narrowly winged, 0.5 to 2 cm. long; blades triangular-ovate or ovate, sometimes lanceolate, 2 to 7 cm. long, 0.8 to 3.5 cm. wide, acute, cuneate to subcordate at base, serrate to coarsely dentate, rarely entire; heads solitary or several, long-peduncled; involucre 5 to 8 mm. high, the phyllaries subequal, linear or lanceolate, acutish to acuminate, somewhat loose; rays usually 1 to 1.5 cm. long.

13. *Verbesina hastata* Kellogg; Curran, Bull. Calif. Acad. **1**: 140. 1885.

Lipochaeta hastata Kellogg, Proc. Calif. Acad. **2**: 106. f. 31. 1863.

Verbesina venosa Greene, Bull. Torrey Club **9**: 110. 1882.

Encelia cedrosensis Rose, Contr. U. S. Nat. Herb. **1**: 17. 1890.

Known only from the type locality, Cedros Island, Baja California.

Shrub; branchlets strigillose; leaves chiefly opposite; petioles narrowly winged, 2 to 15 mm. long; blades rhombic-ovate or ovate, 2.5 to 7.5 cm. long, 1.8 to 5.7 cm. wide, obtuse to acuminate, short-cuneate to subcordate at base, coarsely toothed or sometimes merely hastate-lobed at base, bright green, shining above, reticulate on both sides, strigillose or antrorse-hispidulous; heads few or several; involucre 5 to 7 mm. high, graduate, the phyllaries ovate, obovate, or oblong, obtuse, mostly herbaceous.

14. *Verbesina coahuilensis* A. Gray, Proc. Amer. Acad. **19**: 14. 1883.

Coahuila and Nuevo León: type collected east of Saltillo, Coahuila.

Suffrutescent (?), low, subsimple: stem spreading-hirsute and sessile-glandular; leaves alternate, or opposite below, lance-oblong, 4.5 to 10 cm. long, 1 to 2.3 cm. wide, acutish to acuminate, sessile, decurrent, coarsely and irregularly dentate, green and rough above, griseously subtomentose-pilose beneath; heads solitary or few, pedunculate; involucre about 8 mm. high, the phyllaries slightly graduate, linear, acutish to acuminate, hirsute; rays 1 to 1.7 cm. long.

14a. *Verbesina coahuilensis viridior* Robins. & Greenm. Proc. Amer. Acad. **34**: 546. 1899.

Known only from the type locality, Carneros Pass, Coahuila.

Lower surface of the leaves green and merely scabrous-puberulent.

15. *Verbesina hypoleuca* A. Gray, Proc. Amer. Acad. **15**: 37. 1879.

Known only from the type locality, near city of San Luis Potosí.

Suffrutescent, about 60 cm. high, simple; stem cinereous-puberulous; lowest leaves opposite, the others alternate, lance-oblong or obovate-oblong, 2.5 to 4.5 cm. long, 0.8 to 1.8 cm. wide, dentate, sessile, auriculate-clasping, velvety-puberulous above, canescent-tomentose beneath; heads few, slender-pedicel; phyllaries linear-lanceolate, acuminate, 5 mm. long; rays about 6 mm. long.

16. *Verbesina sororia* A. Gray, Proc. Amer. Acad. **15**: 37. 1879.

San Luis Potosí; type from city of San Luis Potosí.

Suffrutescent (?), tall; stem pilosulous, glabrate below; leaves opposite below or nearly throughout; petioles scarcely winged, 1 cm. long or less; blades lance-elliptic to oval-oblong, 8 to 17 cm. long, 2 to 6.5 cm. wide, acuminate at both ends, acutely serrate or serrulate, scarcely rough above, griseously subtomentose-pilose beneath; heads numerous, cymose-panicled; disk in anthesis 1 to 1.2 cm. high, 5 to 7 mm. thick; involucre 4 to 5 mm. high, the phyllaries few, linear, acute or acutish; rays about 1.2 cm. long.

17. *Verbesina intermissa* Blake, nom. nov.

Coreopsis liebmannii Schultz Bip.; Klatt, Leopoldina **23**: 145. 1887. Not

Verbesina liebmannii Schultz Bip. 1887.

Known only from the type locality, Pelado, Mexico.

Probably shrubby; "stem hirtous"; leaves opposite; petioles about 3 to 8 mm. long; blades rhombic-ovate, 7 to 10 cm. long, 3.5 to 4 cm. wide, acuminate to each end from near the middle, serrate or serrulate, above roughish, strigose

and strigillose, beneath rather densely griseous or subanescent-strigillose and gland-dotted, glabrescent; heads 3 to 6, cymose or cymose-panicled, the pedicels 1 to 2 cm. long; involucre 7 to 8 mm. high, the outer phyllaries linear, acute, spreading; pales with short erectish points; rays 1.5 cm. long.

Fragments of the type have been examined in the Gray Herbarium.

18. *Verbesina hypoglauca* Schultz Bip.; Klatt, Leopoldina **23**: 144. 1887.

Encelia conzattii Greenm. Proc. Amer. Acad. **39**: 111. 1903.

Puebla and Oaxaca; type from Cumbre de Acaleingo.

Shrub 3 to 5 meters high; branches appressed-puberulent; leaves opposite nearly throughout; petioles about 5 mm. long, naked; blades lance-oblong or elliptic, 4.5 to 9.5 cm. long, 1.5 to 3 cm. wide, acuminate at each end, callous-denticulate, green above, subsericeous-canescens beneath with very dense and short appressed hairs; heads usually numerous, cymose-panicled; involucre 4 to 5 mm. high, the outermost phyllaries the longer, linear to oblanceolate, canescens on back; rays 8 to 12 mm. long.

19. *Verbesina neriifolia* Hemsl. Biol. Centr. Amer. Bot. **2**: 188. 1881.

Chiapas.

Similar to *V. hypoglauca*; stem with narrow herbaceous wings; leaves alternate, pubescent as in *V. hypoglauca*; heads few, short-pedicel, the pedicels usually winged; rays 1 to 1.3 cm. long.

20. *Verbesina gracilipes* Robinson, Proc. Bost. Soc. Nat. Hist. **31**: 269. 1904.

Puebla; type from Tehuacán.

Shrub; branches spreading-pubescent; leaves alternate; petioles 5 mm. long or less, often with auricles or decurrent wings at base; blades elliptic or obovate, 2.5 to 8 cm. long, 1 to 2.5 cm. wide, acute or obtusish, long-cuneate at base, green above, canescens tomentose-pilose beneath; heads 1 to 4, long-peduncled; involucre 5 to 7 mm. high, the outermost phyllaries herbaceous, obovate or oblanceolate, loose; rays 1 to 1.5 cm. long.

21. *Verbesina petrophila* T. S. Brandeg. Univ. Calif. Publ. Bot. **3**: 395. 1909.

Puebla; type from Barranca de Tlacuilosto and San Luis Tultitlanapa.

Shrub 0.5 to 1 meter high; branches tuberculate, often narrowly corky-winged by the decurrent leaf bases; leaves alternate, chiefly obovate or elliptic, 3 to 5 cm. long, 1 to 2 cm. wide, obtuse, narrowed to the sessile base, entire, tuberculate-hispidulous, the hairs mostly deciduous; heads 1 to 5, the pedicels 1.5 to 3.5 cm. long; involucre about 8 mm. high, the phyllaries linear-lanceolate, acuminate, loose; rays about 1 cm. long.

22. *Verbesina liebmännii* Schultz Bip.; Klatt, Leopoldina **23**: 144. 1887.

Verbesina variabilis Robins. & Greenm. Proc. Amer. Acad. **32**: 47. 1896.

Chihuahua to Mexico and Oaxaca; type from Cumbre de Estepa, Oaxaca.

Shrubby, 1 to 1.5 meters high; stem puberulous; leaves chiefly alternate; petioles 2 to 15 mm. long, usually with corky auricles or decurrent wings at base; blades lanceolate to rhombic-ovate, 5 to 11.5 cm. long, 1.5 to 5.5 cm. wide, acuminate or acute at both ends, serrate or serrulate, usually rough above, strigillose to pilose beneath chiefly on the veins; heads several or numerous, cymose-panicled, the pedicels 1 to 3.8 cm. long; involucre about 2-seriate, 3 to 5 mm. high, the phyllaries chiefly ovate or oblong, obtuse or acutish; pales with short, cuspidate, spreading or reflexed tips; rays 7 to 12 mm. long.

23. *Verbesina nelsonii* Robins. & Greenm. Proc. Amer. Acad. **32**: 46. 1896.

Known only from the type locality, between Ayusinapa and Petatlán, Oaxaca.

Herbaceous (?), stout; stem appressed-puberulous; internodes sometimes with a corky wing near summit; leaves oblong, 15 to 20 cm. long, 3.7 to 5 cm. wide, acuminate, auriculate-amplexicaul at base, crenate-serrate, practically glabrous; heads numerous, densely cymose-panicled; disk in fruit 8 to 10 mm. thick; involucre barely 2-seriate, 4 mm. high, the phyllaries oblong, obtusish; pales with spreading or reflexed cusps; rays 4 to 5 mm. long.

24. *Verbesina otophylla* Blake, Contr. U. S. Nat. Herb. 22: 638. 1924.

Known only from the type locality, Hacienda Buena Vista, 20 miles east of Abasolo, Tamaulipas.

Shrub; branches strigillose; leaves alternate, lanceolate or elliptic-lanceolate, 7.5 to 10.5 cm. long, 1 to 1.3 cm. wide, acuminate, sessile and narrowly auriculate-clasping at base, serrate, strigillose above, practically glabrous beneath; heads 5, cymose, the pedicels 6 to 20 mm. long; involucre 6 to 7 mm. high, slightly graduate, the phyllaries oblong, obtuse to acutish, appressed; rays 4.5 mm. long. "Jara."

25. *Verbesina potosina* Robinson, Proc. Amer. Acad. 27: 175. 1892.

San Luis Potosí; type from Hacienda de Angostura.

Suffrutescent (?); stem simple below the inflorescence, spreading-pilose, very leafy; leaves alternate, lanceolate or lance-oblong, 5.5 to 16 cm. long, 8 to 20 mm. wide, acuminate, sessile and auriculate-clasping, entire or slightly denticulate, grayish green above, densely canescent-tomentose beneath; heads several or many, cymose-panicled, the pedicels 1.5 to 6.5 cm. long; involucre about 6 mm. high, scarcely graduate, the phyllaries lanceolate, acuminate; rays about 2 mm. long.

26. *Verbesina oreopola* Robins. & Greenm. Proc. Amer. Acad. 34: 550. 1899.

Known only from the type locality, San Luis Potosí.

Shrub; branchlets hirsutulous; leaves alternate, lanceolate or narrowly lance-oblong, 5 to 15 cm. long, 1 to 2.5 cm. wide, attenuate, narrowed to the sessile, usually biauriculate base, smoothish above, rather sparsely pilosulous to canescent-tomentose beneath, obscurely serrulate; heads several in a flattish cymose panicle; involucre 4 mm. high, about 2-seriate, the phyllaries ovate or oblong-ovate, obtusish; pales with short, erect or incurved mucros; rays 5 mm. long.

27. *Verbesina auriculata* DC. Prodr. 5: 617. 1836.

Oaxaca; type from Tehuantepec.

Shrubby; stem finely velvety; leaves alternate, elliptic-oval, 18 to 27.5 cm. long, 5 to 11 cm. wide, acuminate, attenuate to the obtusely auriculate sessile base, dentate, scabrous above, sordid-tomentulose beneath; heads numerous, cymose, with small rays; involucre 2 or 3-seriate, the phyllaries broadly ovate, acute or obtuse; pales subulate-tipped, stiff, nearly glabrous.

28. *Verbesina acapulcensis* Robins. & Greenm. Proc. Amer. Acad. 34: 551. 1899.

Known only from the type locality, vicinity of Acapulco, Guerrero.

Stem puberulent, winged by the decurrent leaf bases; leaves alternate; petioles short, winged; blades ovate or oval-ovate, 10 to 22 cm. long, 2.5 to 12 cm. wide, acuminate at each end, callous-denticulate, scabrous above, sordidly subtoomentose-pilosulous beneath; heads numerous, short-pedicelcd; involucre 5 to 6 mm. high, the phyllaries oblong-ovate, acute; rays about 4 mm. long.

29. *Verbesina xanthochlora* Robins. & Greenm. Proc. Amer. Acad. 34: 551. 1899.

Known only from the type locality, Atlixco, Puebla.

Herb (?); stem canescent-puberulent, narrowly winged by the decurrent leaf bases; leaves mostly opposite, ovate-oblong, about 12 cm. long, 5 cm. wide, obtuse, subtire or dentate-serrate, green on both sides, strigillose; heads short-pedicelcd, cymose; involucre 5 mm. high, the phyllaries suborbicular, with obtuse or rounded, squarrose, herbaceous tips; rays about 5 mm. long.

30. *Verbesina mollis* H. B. K. Nov. Gen. & Sp. 4: 203. 1820.

Verbesina sericea Kunth & Bouché, "Ind. Sem. Hort. Berol. 1848: 14. 1848;"

Ann. Sci. Nat. III. Bot. 11: 228. 1849.

Vernonia exaltata Hort.; Kunth & Bouché, Ann. Sci. Nat. III. Bot. 11: 228. 1849, as synonym.

Vernonia karwinskiana Hort.; Kunth & Bouché, Ann. Sci. Nat. III. Bot. 11: 228. 1849, as synonym. Not *Vernonia karwinskiana* DC. 1836.

Oaxaca; type collected between Guanajuato and Villalpando.

Shrubby; stem densely subtomentose-pilose, narrowly winged; leaves alternate, elliptic to ovate, 5 to 9.5 cm. long, 1.5 to 3.5 cm. wide, acute, sessile, entire or callous-denticulate, densely and rather softly pubescent but green or greenish above, densely and canescently silky-tomentose beneath; heads several or numerous, cymose-panicle; pales with erect acuminate tips; rays about 2 mm. long. "Ich-peyotl" (*Reko*).

31. *Verbesina oncophora* Robins. & Seat. Proc. Amer. Acad. 28: 109. 1893.

Verbesina virgata conyzoides DC. Prodr. 5: 616. 1836.

Verbesina conyzoides Moc. & Sessé; DC. Prodr. 5: 616. 1836, as synonym.

Not *V. conyzoides* "Trew, 1769."

Mexico and Morelos; type from Sierra de las Cruces, State of Mexico.

Shrub 2 to 3.5 meters high; stem cinereous-puberulent; leaves alternate, rarely partly opposite; petioles 1 to 2.5 cm. long, naked, bearing at base a pair of corky, usually deciduous auricles; blades elliptic-oblong or oblong-ovate, 6 to 18 cm. long, 2.5 to 6.3 cm. wide, acute or acuminate at each end, serrulate, rough above, cinereously or subcanescently tomentose-pilosulous beneath; heads numerous, cymose-panicle, short-pedicel; involucre 2.5 to 3.5 mm. high, the phyllaries ovate or oblong, obtuse to acute; pales blunt or with short erect mucros; rays about 3 mm. long.

32. *Verbesina virgata* Cav. Icon. Pl. 3: 38. *pl.* 275. 1795.

Verbesina salicifolia H. B. K. Nov. Gen. & Sp. 4: 205. 1820.

Zacatecas to Oaxaca; type from Mexico, without definite locality.

Shrubby, up to 2.5 meters high; stem puberulous; leaves sessile or short-petioled, at base usually with corky auricles or decurrent on the stem, the blades lanceolate or lance-oblong, 6 to 16 cm. long, 1 to 3 cm. wide, acuminate, usually rounded at base, serrate or serrulate, smooth or smoothish above, sparsely puberulous or pubescent beneath; heads numerous, in a usually concave panicle; involucre about 5 mm. high, the phyllaries obtuse to acuminate; pales with recurved cusps; rays 4 to 6 mm. (rarely 1 cm.) long.

33. *Verbesina serrata* Cav. Icon. Pl. 3: 7. *pl.* 214. 1795.

Durango to Jalisco and Hidalgo; type from Mexico, without definite locality.

Shrub 1 to 1.5 meters high; stem sparsely or densely pubescent; leaves opposite, very rarely alternate or ternate; petioles 5 to 10 mm. long; blades ovate or lance-ovate, 5 to 12 cm. long, 2 to 7 cm. wide, acuminate, cuneate to rounded at base, sharply and usually coarsely toothed, green and rough above, beneath paler, densely cinereous-pilose or hirsute-pilose and usually prominently reticulate; heads usually numerous, cymose-panicle; involucre 4 to 7 mm. high, subequal, the phyllaries mostly oblong or obovate, herbaceous, obtuse; pales acute, erect-tipped; rays about 5 mm. long. "Palo cenizo" (Michoacán); "vara blanca" (Guanajuato).

33a. *Verbesina serrata pringlei* (Robinson) Robins. & Greenm. Proc. Amer. Acad. 34: 553. 1899.

Verbesina pringlei Robinson, Proc. Amer. Acad. 27: 175. 1892.

Jalisco and Michoacán; type from Guadalajara, Jalisco.

Similar; leaves triangular-ovate in outline, coarsely incised-toothed or lobed.

33b. *Verbesina serrata amphichlora* Robins. & Greenm. Proc. Amer. Acad. 34: 553. 1899.

Known only from the type locality, between Ramos and Inde, Durango.

Leaves lance-ovate, finely appressed-puberulent and bright green on both sides.

34. *Verbesina resinosa* Klatt, Leopoldina 23: 144. 1887.

Known only from the type locality, Yavesia, Oaxaca.

Branchlets pubescent, resiniferous; leaves opposite; petioles 4 to 6 mm. long; blades oblong, 7.5 cm. long, 2.5 cm. wide, serrulate, glabrous above, beneath paler, pilose along the veins, reticulate-venose; heads cymose-panicled; phyllaries 2-seriate, obtuse, pilose above and ciliate; rays 6. (Description compiled.)

35. *Verbesina luisana* T. S. Brandeg. Zoe 5: 259. 1908.

Puebla; type from San Luis Tultitlanapa.

Suffrutescent; branchlets pilosulous; leaves opposite; petioles 5 to 10 mm. long, sometimes narrowly winged; blades ovate or lance-ovate, 5 to 7 cm. long, 2.5 to 4 cm. wide, acuminate, cuneate or rounded at base, serrate, rough above, griseous-pilosulous or hispidulous (the hairs with glandular-tuberculate bases) and reticulate beneath; heads few to rather numerous, in somewhat umbelliform cymes or cymose panicles, subcylindric in anthesis; involucre 3 to 4 mm. high, 2-seriate, the phyllaries ovate, obtuse to acutish; rays about 2, about 2 mm. long.

36. *Verbesina grayii* (Schultz Bip.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 188. 1881, as *V. grayi*.

Zexmenia grayii Schultz Bip. in Seem. Bot. Voy. Herald 305. 1856.

Known only from the type locality, Sierra Madre of northern Mexico.

Suffruticulose, pubescent; leaves opposite; petioles 4 to 6 mm. long; blades ovate-lanceolate, 6.5 to 9 cm. long, 1.4 to 2 cm. wide, attenuate at each end, rough above, beneath pale, tomentulose, and prominently reticulate; heads 1 to 3, about equaling the pedicels; involucre 6 mm. high, the phyllaries linear-lanceolate, acute or acuminate (obtuse according to Robinson & Greenman); rays 4 mm. long. (Description compiled.)

37. *Verbesina molinaria* Robins. & Greenm. Proc. Amer. Acad. 34: 553. 1899.

Morelos; type from Cuernavaca.

Shrub 2.5 to 5 meters high; stem cinereous-puberulous; leaves chiefly opposite; petioles 3 to 7 mm. long; blades elliptic-oblong, 8 to 15.5 cm. long, 2 to 4 cm. wide, acuminate at each end, serrulate or serrate, green and rough above, densely and cinereously pilose-tomentose beneath; heads rather small, numerous, cymose-panicled, exceeded by the leaves; involucre 3 mm. high, the phyllaries oblong to lance-ovate, acutish to acuminate; pales with short erectish mucros; rays about 2 mm. long.

38. *Verbesina robinsonii* (Klatt) Fernald; Robins. & Greenm. Proc. Amer. Acad. 34: 554. 1899.

Otopappus alternifolius Robinson, Proc. Amer. Acad. 26: 165. 1891.

Otopappus robinsonii Klatt, Ann. Naturhist. Hofmus. Wien 9: 362. 1894.

Verbesina alternifolia Blake, Journ. Bot. Brit. & For. 53: 235. 1915. Not *V. alternifolia* Britton, 1893.

San Luis Potosí; type from San José Pass.

Shrubby (?); stem cinereous-pilosulous; leaves alternate; petioles 5 to 7 mm. long; blades oblong-lanceolate, 8 to 10 cm. long, 2 to 3 cm. wide, acuminate at each end, serrate or serrulate, green and scarcely rough above, cinereous-tomentose beneath; heads several, in fruit 1.2 to 1.5 cm. thick, in a flattish cymose panicle, the pedicels 0.8 to 5 cm. long; involucre 7 to 10 mm. high, the phyllaries lanceolate-linear or linear, herbaceous, acute or acutish; rays about 4 mm. long.

39. *Verbesina chiapensis* Robins. & Greenm. Proc. Amer. Acad. 34: 554. 1899.

Known only from the type locality, near Tumbalá, Chiapas.

Shrub; branches strigillose; leaves alternate; petioles about 4 mm. long; blades lance-oblong, 15 to 20 cm. long, 3.2 to 6 cm. wide, attenuate, acuminate at base, serrulate, subglabrous above, green and finely appressed-puberulent beneath;

heads numerous, cymose-panicled, the pedicels 1 to 4 cm. long; disk in fruit 1.2 cm. thick; involucre 2-seriate, 3 mm. high, the phyllaries ovate or ovate-oblong, obtuse to acutish; rays about 8 mm. long.

40. *Verbesina cinerascens* Robins. & Greenm. Proc. Amer. Acad. 34: 555. 1899.

Known only from the type locality, near Guadalajara, Jalisco.

Shrub 1.5 to 2.5 meters high; branchlets pilosulous; leaves alternate, short-petioled, lanceolate or lance-oblong, 5.5 to 13 cm. long, 1 to 3 cm. wide, acuminate at each end, serrulate or serrate, rough above, cinerascently pilosulous beneath; heads rather numerous, in fastigiata cymose panicles, the pedicels 3 cm. long or less; disk in fruit 7 to 10 mm. thick; involucre 3 to 4 mm. high, the phyllaries ovate or oblong-ovate, acute; pales in fruit with recurved mucros; rays 3 to 8 mm. long.

41. *Verbesina crassipes* Robins. & Greenm. Proc. Amer. Acad. 34: 555. 1899.

Oaxaca; type from Cañada Santa María.

Shrub; branches scabrous-tomentose; leaves alternate, sessile, obovate-lanceolate, 6 to 9 cm. long, 2 to 3 cm. wide, acute, cuneate at base, serrate, rough above, beneath green and tomentulose (at least on the veins) and at length scabrous; heads numerous, densely cymose, the pedicels thick and short; disk in fruit 1.5 cm. thick; phyllaries ovate-oblong to obovate, obtuse to acute, appressed-pubescent; pales acute; rays 8 to 9 mm. long. (Description compiled.)

42. *Verbesina hypargyrea* Robins. & Greenm. Proc. Amer. Acad. 34: 556. 1899.

Chiapas; type collected between Hacienda Juneana and San Vicente. Guatemala.

Shrub or tree; branches cinereous-puberulent, glabrate; leaves alternate, sessile or petioled, lance-oblong or lanceolate, 5 to 12.5 cm. long, 1.5 to 3 cm. wide, acute or acuminate, at base acuminate, crenate-serrate, green and smooth above, densely silvery-strigillose beneath; heads numerous, panicled, the pedicels mostly about 1 cm. long or less; disk in fruit 7 to 10 mm. thick; involucre 3 mm. high, the phyllaries ovate or oblong, obtuse or the inner acutish; pales erect-mucronate; rays about 4 mm. long.

43. *Verbesina persicifolia* DC. Prodr. 5: 614. 1836.

Tamaulipas, San Luis Potosí, and Veracruz; type collected between Santander and Victoria, Tamaulipas.

Shrubby; branches sparsely strigillose; leaves alternate; petioles 7 to 12 mm. long; blades lance-elliptic to oblong-ovate, 7 to 14 cm. long, 1.5 to 5.5 cm. long, acuminate at each end, serrate or serrulate, green and smoothish above, green and glabrous beneath except for the sparsely strigillose costa and chief veins; heads usually numerous, cymose-panicled, the pedicels 1 to 6 cm. long; disk in fruit 1 to 1.3 cm. thick; involucre 5 to 6 mm. high, the phyllaries chiefly narrow-oblong and obtuse, ciliate, otherwise nearly glabrous; pales obtuse or shortly erect-mucronate; rays about 5 mm. long.

44. *Verbesina olivacea* Klatt, Leopoldina 20: 93. 1884.

Silphium arborescens Mill. Gard. Dict. ed. 8. *Silphium* no. 4. 1768.

Otopappus olivaceus Klatt, Ann. Naturhist. Hofmus. Wien 9: 362. 1894.

Verbesina arborescens Blake, Journ. Bot. Brit. & For. 53: 57. 1915. Not *V. arborescens* Gómez, 1890.

Tamaulipas, Veracruz, and Oaxaca; type from Hacienda de la Laguna, Veracruz.

Shrub 3.5 to 4 meters high; stem puberulous; leaves alternate; petioles 4 to 12 mm. long; blades lance-oblong, ovate-oblong, or subrhombic-ovate, 5 to 11.5 cm. long, 2.3 to 4.3 cm. wide, obtuse to acuminate, acuminate at base, serrate or

serrulate, rough above, sordidly subtomentose-pilosulous beneath; heads rather numerous, cymose or cymose-panicled, the pedicels 1.5 to 8.5 cm. long; disk in fruit 1 to 1.5 cm. thick; involucre 5 to 7.5 mm. high, the phyllaries about 3-seriate, slightly graduate, oblong, obtuse; pales obtuse or acutish; rays about 6 mm. long.

45. *Verbesina seemannii* Schultz Bip. in Seem. Bot. Voy. Herald 306. 1856.

Chihuahua; type from the Sierra Madre of northwestern Mexico.

Shrubby; branches glabrous; leaves alternate; petioles 6 mm. long; blades oblong-lanceolate, 10 cm. long, 2.5 cm. wide, attenuate at each end, serrate, rough above, glabrescent beneath; heads cymose; involucre 2-seriate, 2 mm. high, the phyllaries ovate-oblong, obtuse; pales with reflexed mucro; rays 6 to 8 mm. long. (Description compiled.)

46. *Verbesina angustifolia* (Benth.) Blake, Journ. Bot. Brit. & For. **53**: 199. 1915.

Salmea angustifolia Benth. Bot. Voy. Sulph. 117. 1844.

Known only from the type locality, west coast of Mexico.

Shrub; branches densely spreading-hispidulous; leaves alternate; petioles 1 to 2 mm. long; blades lanceolate, 5.5 to 8.5 cm. long, 1.4 to 2.2 cm. wide, acute to acuminate at each end, obscurely serrulate, harsh above, rather densely tuberculate-hispidulous beneath; heads several, exceeded by the leaves, the disk 9.5 mm. wide in fruit; involucre 2-seriate, about 1.5 mm. high, the phyllaries broadly ovate, obtuse, nearly glabrous; pales with recurved tip; rays not seen.

47. *Verbesina cymbipalea* Blake, Contr. U. S. Nat. Herb. **22**: 638. 1924.

Known only from the type locality, Tepic, Tepic.

Probably shrubby; stem naked or narrowly winged, densely spreading-hispidulous; leaves alternate; petioles 3 to 6 mm. long; blades lance-elliptic, 7 to 16 cm. long, 1.5 to 4 cm. wide, acuminate at each end, serrulate, rough above, evenly hispidulous beneath; heads numerous, panicled, the pedicels 1.5 to 3 cm. long; disk in fruit 7 to 10 mm. thick; involucre 2-seriate, 2 mm. high, the phyllaries oblong or oval, obtuse; pales with reflexed tip; rays 3 mm. long.

48. *Verbesina abscondita* Klatt, Leopoldina **20**: 93. 1884.

Verbesina smithii Robins. & Greenm. Proc. Amer. Acad. **32**: 46. 1896.

Puebla and Oaxaca; type from Mexico, without definite locality. Guatemala.

Shrub, up to 5 meters high; branches pilosulous to hispidulous with spreading hairs; leaves alternate; petioles 2 to 8 mm. long; blades elliptic to rhombic-ovate, 5 to 10 cm. long, 2 to 3.8 cm. wide, acute to acuminate at each end, serrate or serrulate, very rough and in age rugose above, beneath densely and griseously or canescently subtomentose-pilosulous or hispidulous; heads numerous, cymose-panicled, the pedicels usually less than 1 cm. long; disk in fruit about 7 mm. thick; involucre about 3 mm. high, the phyllaries obtuse to acutish; pales straight-tipped; rays about 2.5 mm. long.

49. *Verbesina perymenioides* Schultz Bip.; Klatt, Leopoldina **23**: 143. 1887.

Oaxaca; type from Yavesia.

Shrub 2 to 5 meters high; branches strigose or strigillose; leaves alternate; petioles 5 to 15 mm. long; blades elliptic-lanceolate or elliptic-ovate, 7.5 to 13 cm. long, 2 to 4.5 cm. wide, acuminate at each end, serrate or serrulate, smooth above, sparsely or rather densely and loosely pilosulous beneath; inflorescence much as in *V. abscondita*, but the pedicels strigillose, usually about 1 cm. long.

50. *Verbesina ortegae* Blake, Proc. Biol. Soc. Washington **32**: 191. 1919.

Known only from the type locality, San Ignacio, Sinaloa.

Shrubby; branches strigillose; leaves like those of *V. perymenioides*, but sparsely strigillose beneath; panicles as in *V. perymenioides*.

51. *Verbesina fastigiata* Robins. & Greenm. Proc. Amer. Acad. 34: 558. 1899. Mexico, without definite locality.

Tomentulose, the young parts white-woolly; stem rather broadly winged; leaves alternate; petioles winged; blades palmately 3-lobed, 8 to 20 cm. long, 5 to 14 cm. wide, scabrid above, loosely canescent-tomentose beneath; heads numerous, in flattish fastigiate cymose panicles; involucre about 3-seriate, the phyllaries narrow-ovate, acute; pales erect-tipped; rays small. (Description compiled.)

52. *Verbesina greenmani* Urban, Symb. Antill. 5: 265. 1907.

Verbesina pinnatifida Cav. Icon. Pl. 1: 67. pl. 100. 1791. Not *V. pinnatifida* Swartz, 1788.

Western Mexico, from Sinaloa to Oaxaca; type from Mexico, without definite locality.

Shrubby, up to 6 meters high; stem pubescent to nearly glabrous, rather broadly winged; leaves opposite, large, mostly 15 to 32 cm. long (including the broadly winged petiole), 7 to 19 cm. wide, ovate in outline, coarsely 3-lobed to pinnatifid, rough above, green or griseous beneath; heads numerous, in fastigiate cymose panicles; involucre about 3.5 mm. high; rays about 3 mm. long. "Capitana," "huichín" (Ramírez).

53. *Verbesina montanoifolia* Robins. & Greenm. Proc. Amer. Acad. 34: 559. 1899.

Verbesina montanoifolia leptopoda Robinson, Proc. Amer. Acad. 43: 40. 1907. Michoacán; type from Pátzcuaro.

Shrubby, up to 5 meters high; stem narrowly 4-winged, puberulous; leaves opposite; petioles broadly or narrowly winged at least above, 1 to 3 cm. long; blades broadly ovate in outline, 4.5 to 16 cm. long, 3 to 13 cm. wide, sinuately 3 or 5-lobed or the upper unlobed, serrate, rough above, beneath hispidulous or pilosulous and densely reticulate; heads numerous, in fastigiate cymose panicles; involucre about 3 mm. high; rays 3 to 6 mm. long.

54. *Verbesina trilobata* Robins. & Greenm. Proc. Amer. Acad. 32: 46. 1896. Oaxaca; type from Monte Alban.

Shrubby, 1.6 to 3.3 meters high; stem wingless, nearly or quite glabrous; leaves opposite; petioles winged at least above, about 2 cm. long; blades rhombic-ovate in outline, 8 to 12 cm. long, about 4.5 cm. wide, 3-lobed, serrulate, rough above, griseous-hispidulous or hirsute beneath, not prominently reticulate; heads in fastigiate cymose panicles; involucre 3 to 4 mm. high, the phyllaries chiefly linear-lanceolate, acutish; rays 4 to 8 mm. long.

55. *Verbesina sublobata* Benth. Pl. Hartw. 76. 1841.

Chiapas. Guatemala; type from Sunil.

Shrub about 1.5 meters high; stem densely and sordidly subtomentose-pilose, wingless; leaves alternate, ovate in outline, up to 22 cm. long (including the broadly winged petiole), 14 cm. wide, sinuately lobed, callous-denticulate, rough above, sordidly pilose-tomentose beneath; heads numerous, in large rounded panicles; involucre about 3 mm. high, the phyllaries linear to oblanceolate, acuminate; rays white, about 2 mm. long; achenes rather narrowly winged.

56. *Verbesina turbacensis* H. B. K. Nov. Gen. & Sp. 4: 203. 1820.

Verbesina verbascifolia Walp. Bot. Zeit. 9: 63. 1851.

Verbesina nicaraguensis Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 97. 1852.

Verbesina microcephala Benth. in Oerst. Nat. For. Kjöbenhavn Vid. Medd. 1852: 98. 1852.

Michoacán or Guerrero to Veracruz and Oaxaca. Guatemala to Costa Rica; Colombia and Venezuela; type from Turbaco, Colombia.

Shrubby or suffrutescent, 1.5 to 6.5 meters high; branches densely sordid-puberulous or tomentose, winged by the decurrent leaf bases; leaves alternate, ovate or rhombic in outline, 12 to 38 cm. long (including the broadly winged petiole), repand-toothed to pinnatifid, rough above, griseous- or cinereous-puberulous to subtomentose beneath; heads small, very numerous in large fastigiate cymose panicles; involucre 1.5 to 3 mm. high; rays white, 2 to 4 mm. long. "Camaliote," "chimaliote," "chimaliote blanco" (El Salvador).

57. *Verbesina hypsela* Robinson, Proc. Bost. Soc. Nat. Hist. **31**: 269. 1904.

Chiapas.

Herbaceous (?), tall; stem glabrous, purplish, winged by the decurrent leaf bases; leaves alternate, 10 to 30 cm. long, 7 to 18 cm. wide, deeply pinnatifid (the lobes 13 to 15), above very smooth, beneath thinly appressed-pubescent; heads small, very numerous in a large convex panicle; rays white, 8 mm. long. (Description compiled.)

58. *Verbesina gigantoides* Robinson, Proc. Amer. Acad. **47**: 213. 1911.

Known only from the type locality, Yajalón, Chiapas.

Herbaceous (?), tall; stem purplish, glabrous, wingless; leaves alternate; petioles wingless, 5 to 15.5 cm. long; blades 15 to 30 cm. long, 10 to 25 cm. wide, pinnatifid (the lobes about 11), smooth above, softly pubescent beneath; heads small, numerous in a large convex panicle; rays white, 3.5 mm. long.

59. *Verbesina pauciflora* Hemsl. Biol. Centr. Amer. Bot. **2**: 189. 1881.

Verbesina cymosa A. Gray, Proc. Amer. Acad. **21**: 390. 1886.

Sinaloa and Chihuahua; type from Cerro de Pinal, Sinaloa.

Shrubby; stem wingless, hirsute-pilose, glabrescent; leaves opposite, short-petioled, lance-oblong, 12 to 20 cm. long, 1.8 to 3.5 cm. wide, acuminate, cuneate at base, scabrid above, cinereously subtomentose-hirsute beneath; heads very numerous, small, 9-flowered, yellow, discoid, in cymose panicles; involucre 3 mm. high, the phyllaries oblong, obtuse, hirsute.

60. *Verbesina oligantha* Robinson, Proc. Amer. Acad. **47**: 214. 1911.

Known only from the type locality, Jimalcoota, Michoacán or Guerrero.

Shrubby, 2 to 3 meters high; stem wingless, scabrid-puberulous; leaves opposite; petioles 1 to 1.5 cm. long; blades ovate or elliptic-ovate, 12 to 16 cm. long, 4 to 7 cm. wide, acuminate, cuneate at base, serrate, green and harsh on both sides; heads numerous, in flat cymose panicles, 12 mm. high, 4 mm. thick, discoid, yellow, 7-flowered; involucre 3 mm. high, the phyllaries ovate or oblong, obtuse to acute.

DOUBTFUL SPECIES.

VERBESINA OAXACANA DC. Prodr. **5**: 614. 1836.

VERBESINA SARTORII Schultz Bip.; Klatt, Leopoldina **23**: 143. 1887, as synonym. This name is published by Klatt with reference to a Mexican plant collected by Liebmann, but is referred as a synonym to *V. leprosa* Klatt, a species restricted to Martinique.

VERBESINA TRIPLINERVIA Visiani, Nuov. Sagg. Accad. Sci. Padova **5**: 264. 1840. Insufficiently described.

76. *COREOPSIS* L. Sp. Pl. 907. 1753.

Herbs or shrubs; leaves chiefly opposite; heads (in ours) yellow, radiate, the rays pistillate or neutral; involucre double, the outer phyllaries herbaceous, 1-seriate, small, the inner about 2-seriate, equal, submembranous, usually brownish, vittate; achenes obcompressed, usually marginate or winged; pappus (in ours) of 2 smooth or antrorse-ciliate awns, or wanting.

Rays pistillate, fertile.

Leaves lanceolate to oval, unlobed or ternatisect.

Heads numerous, cymose-panicled; leaves lanceolate to oblong-ovate, unlobed or ternatisect.....1. *C. mutica*.

Heads solitary or few; leaves cuneately oblanceolate to oval, unlobed.

Leaves 2 to 5 cm. long, cuneately oblanceolate or obovate.

2. *C. cuneifolia*.

Leaves 1 to 2 cm. long, oval.....3. *C. parvifolia*.

Leaves or their lobes linear-filiform or very narrowly linear.

Leaves entire, or rarely with a pair of lobes, 2 to 6 cm. long.

4. *C. cyclocarpa*.

Leaves all, except sometimes the uppermost, pinnately 3 to 7-lobed.

Heads larger; involucre 6 to 8 mm. high; leaves mostly with 3 pairs of lobes.....5. *C. pinnatisecta*.

Heads smaller; involucre 4 to 5 mm. high; leaves mostly with 1 pair of lobes.....6. *C. insularis*.

Rays neutral.

Pappus none; achenes glabrous.....7. *C. cordylocarpa*.

Pappus awns 2, antrorse-ciliate; achenes ciliate.

Leaves rhombic, merely serrate or doubly serrate....8. *C. petrophiloides*.

Leaves once or twice pinnatisect.

Heads smaller; inner phyllaries about 5 mm. long; rays 4 to 8 mm. long.

9. *C. petrophila*.

Heads larger; inner phyllaries 6 to 9 mm. long; rays 1 to 2 cm. long.

Outer phyllaries narrowly linear; ultimate lobes of the leaves 1 to 2.5 mm. wide.....10. *C. rhyacophila*.

Outer phyllaries linear-oblong; ultimate lobes of the leaves 0.6 to 0.8 mm. wide.....11. *C. pringlei*.

1. *Coreopsis mutica* DC. Prodr. 5: 571. 1836.

Electra mexicana DC. Prodr. 5: 630. 1836.

Electra galeottii A. Gray, Pl. Wright. 1: 110. 1852.

Coreopsis galeottii Hemsl. Biol. Centr. Amer. Bot. 2: 195. 1881.

Coreopsis mexicana Hemsl. Biol. Centr. Amer. Bot. 2: 196. 1881.

Guanajuato to Chiapas; type from Tlapuajahua. Guatemala.

Shrubby, nearly or quite glabrous throughout, 2 meters high or less; leaf blades lanceolate to oblong-ovate, 4 to 13.5 cm. long, serrate, often ternatisect, coriaceous or papery, petiolate; heads 2 to 4.5 cm. wide; achenes glabrous, epappose, or the inner rarely with a pair of smooth slender awns.

1a. *Coreopsis mutica subvillosa* DC. Prodr. 5: 571. 1836.

Coreopsis mexicana hyperdasya Blake, Proc. Amer. Acad. 49: 338. 1913.

Hidalgo and Oaxaca; type from Mexico, without definite locality.

Stem, inflorescence, and lower leaf surface densely tomentose.

1b. *Coreopsis mutica holotricha* Blake, Contr. Gray Herb. n. ser. 52: 55. 1917.

Coreopsis mexicana hyperdasya holotricha Blake, Proc. Amer. Acad. 49: 338. 1913.

Known only from the type locality, near San Luis Tultitlanapa, Puebla.

Leaves small, densely and rather harshly cinereous-puberulous on both sides.

2. *Coreopsis cuneifolia* Greenm. Proc. Amer. Acad. 40: 43. 1904.

Durango and Jalisco; type from State of Durango.

Fruticose or suffruticose, about 60 cm. high, erect-branched, somewhat pubescent, glabrate; leaf blades toothed above the middle, sessile; heads few, long-peduncled, 2 cm. wide; achenes epappose.

3. *Coreopsis parvifolia* Blake, Proc. Amer. Acad. 49: 338. 1913.

Known only from the type locality, Esperanza, Puebla.

Shrub, trichotomously branched, somewhat pubescent, glabrate; leaf blades oval, serrate above the base, subsessile; heads solitary, 3 cm. wide, on peduncles 3 to 6.5 cm. long; achenes epappose.

4. *Coreopsis cyclocarpa* Blake, Proc. Amer. Acad. 49: 339. 1913.

Leptosyne mexicana A. Gray in S. Wats. Proc. Amer. Acad. 22: 429. 1887.

Not *Coreopsis mexicana* Hemsl. 1881.

Jalisco; type from Río Blanco.

Herbaceous or suffruticulose, many-stemmed, about 60 cm. high, nearly glabrous, leafy; leaves 2 mm. wide or less; heads few, long-peduncled, 1.5 to 2.5 cm. wide; disk corollas without hairy annulus; outer achenes suborbicular; pappus none.

5. *Coreopsis pinnatisecta* Blake, Proc. Amer. Acad. 49: 339. 1913.

Leptosyne pringlei Robins. & Greenm. Amer. Journ. Sci. III. 50: 155. 1895.

Not *Coreopsis pringlei* Robinson. 1907.

Puebla and Oaxaca; type from Sierra de San Felipe, Oaxaca.

Herbaceous or suffruticulose, 40 to 70 cm. high, essentially glabrous; leaves 2 to 4 cm. long, pinnately or sometimes bipinnately lobed, the lobes 1 mm. wide or less; heads few, long-peduncled, 2.5 cm. wide; disk corollas with hairy annulus; pappus none.

6. *Coreopsis insularis* (T. S. Brandeg.) Blake, Proc. Amer. Acad. 49: 340. 1913.

Leptosyne insularis T. S. Brandeg. Erythea 7: 5. 1899.

Known only from the type locality, Socorro Island.

Decumbent, suffruticulose or suffruticulose, nearly glabrous; leaves 1 to 2.5 cm. long, the lobes 1 mm. wide or less; disk corollas without annulus; pappus none.

7. *Coreopsis cordylocarpa* A. Gray in S. Wats. Proc. Amer. Acad. 22: 428. 1887.

Jalisco; type from Río Blanco.

Suffrutescent, about 2 meters high, leafy; leaves petioled, the blades 4.5 to 12 cm. long, pinnatisect, the lobes 2 or 3 pairs, linear-lanceolate, serrate or the lower sometimes lobed at base, 2 to 9 mm. wide, somewhat pubescent; heads few or numerous, long-peduncled, 2.5 to 3.5 cm. wide; achenes linear-clavate, scarcely obcompressed, up to 12 mm. long.

8. *Coreopsis petrophiloides* Robins. & Greenm. Proc. Amer. Acad. 29: 388. 1894.

Colima to Michoacán; type from the Nevada de Colima.

Shrubby, 1 meter high, sparsely pubescent above and often on the leaves; leaves petioled, the blades 4 to 9 cm. long, 1 to 3.5 cm. wide, acute at each end or acuminate, the upper reduced; heads few, about 3.5 cm. wide.

9. *Coreopsis petrophila* A. Gray in S. Wats. Proc. Amer. Acad. 22: 428. 1887.

Durango and Jalisco; type from Río Blanco, Jalisco.

Suffruticulose, branched, very leafy, nearly or quite glabrous; leaves slender-petioled, the blades deltoid in outline, 3 to 4 cm. long and wide, bipinnatisect, the primary lobes 3 or 4 pairs, the ultimate divisions 1 to 2 mm. wide; heads several or many, panicle, 1.5 to 2 cm. wide.

The specimen from Durango has broader leaf lobes than normal, and is referred to this species with some hesitation.

10. *Coreopsis rhyacophila* Greenm. Proc. Amer. Acad. 35: 313. 1900.

Morelos; type from Cuernavaca.

Suffrutescent, 1 meter high or less, nearly glabrous; leaves slender-petioled, often with fascicles in their axils, the blades deltoid, 3 to 8 cm. long and wide, bipinnatisect, the primary lobes 3 to 5 pairs; heads 2.5 to 4 cm. wide.

11. *Coreopsis pringlei* Robinson, Proc. Amer. Acad. **43**: 41. 1907.

Known only from the type locality, San Juan del Río, Querétaro.

Shrub, essentially glabrous; leaves petioled, the blades 2 to 4 cm. long, 1 to 3 cm. wide, bipinnatisect, the segments narrowly linear; heads 1 to 5, 3 cm. wide.

77. COREOCARPUS Benth. Bot. Voy. Sulph. **28**. pl. 16. 1844.

REFERENCE: Blake, Proc. Amer. Acad. **49**: 342-345. 1913.

Shrubs or herbs; leaves opposite, once to thrice pinnatisect; heads small, radiate, yellow (or the rays sometimes white or purple-tinged), cymose-panicled; involucre 2-seriate, subequal, the phyllaries 5 to 8, all submembranous, ovate to ovate-oblong, narrowly pale-margined, lineate, sometimes with a few small herbaceous bractlets at base; rays fertile; achenes obcompressed, with entire or pectinate crustaceous wings; pappus none or of 2 retrorsely hispidulous awns.

Leaves fleshy; wings of achene entire or merely crenulate.....1. **C. dissectus**.

Leaves not fleshy; wings of achene pectinately cut.....2. **C. arizonicus**.

1. *Coreocarpus dissectus* (Benth.) Blake, Proc. Amer. Acad. **49**: 344. 1913.

Acoma dissecta Benth. Bot. Voy. Sulph. **29**. pl. 17. 1844.

Coreocarpus dissectus longilobus Blake, Proc. Amer. Acad. **49**: 345. 1913.

Southern half of Baja California; type from Magdalena Bay.¹

Shrubby, about 40 cm. high, trichotomously branched, essentially glabrous; leaves crowded, petioled, the blades 1.5 to 7.5 cm. long, once to thrice pinnatisect, the primary lobes 2 or 3 pairs, the ultimate divisions linear-filiform to linear-lanceolate, 2.5 mm. wide or less; heads yellow, 1 to 1.5 cm. wide, the pedunculate panicles nearly naked; pappus none.

2. *Coreocarpus arizonicus* (A. Gray) Blake, Proc. Amer. Acad. **49**: 344. 1913.

Leptosyne arizonica A. Gray, Proc. Amer. Acad. **17**: 218. 1882.

Coreopsis arizonica O. Hoffm. in Engl. & Prantl, Pflanzenfam. **4**⁵: 243. f. 118, S. 1890.

Sonora and Chihuahua. Arizona; type from Fort Lowell.

Suffruticlose, 30 to 60 cm. high, essentially glabrous, branched at base; leaves petioled, the blades 5 to 8 cm. long, pinnatisect into 3 to 5 linear lobes 1 to 3 mm. wide, the lower pair sometimes again pinnatisect; heads yellow, or the rays white; achenes sometimes with a pappus of retrorsely spinulose awns.

2a. *Coreocarpus arizonicus pubescens* (Robins. & Fern.) Blake, Proc. Amer. Acad. **49**: 344. 1913.

Leptosyne arizonica pubescens Robins. & Fern. Proc. Amer. Acad. **30**: 118. 1894.

Sonora; type from Granados.

Whole plant rather densely spreading-pilosulous.

2b. *Coreocarpus arizonicus filiformis* (Greenm.) Blake, Proc. Amer. Acad. **49**: 344. 1913.

Leptosyne arizonica filiformis Greenm. Proc. Amer. Acad. **40**: 44. 1904.

Known only from the type locality, Sierra de Choix, Sinaloa.

Leaf lobes linear-filiform, less than 1 mm. wide, the lower ones 4 to 6 cm. long.

¹ See Blake, Contr. Gray Herb. n. ser. **52**: 56. 1917.

78. HIDALGOA Llave in Llave & Lex. Nov. Veg. Descri. 1: 15. 1824.**1. Hidalgo ternata** Llave in Llave & Lex. Nov. Veg. Descri. 1: 15. 1824.*Hidalgoa lessingii* DC. Prodr. 5: 511. 1836.*Melampodium ? hidalgoa* DC. Prodr. 5: 521. 1836.

Veracruz and Oaxaca; type from Río Blanco, near San José del Corral. Guatemala and Ecuador.

Suffrutescent (?), somewhat sordid-pubescent or essentially glabrous, high-climbing, the basally coiled and often thickened petioles functioning as tendrils; leaves opposite, the petioles slender, about 4 cm. long, the blades about 6 cm. long, ternatisect, the lobes ovate, acute, crenate-serrate, stipitate or sessile, thin; heads solitary or few, axillary and terminal, long-peduncled, 2.2 to 4.2 cm. wide; involucre double, as in *Coreopsis*; rays 5, orange, yellow, or apparently purplish red, fertile; disk yellow (?), infertile, the styles undivided, the corollas irregular, one tooth being deeper cut than the others; ray achenes oval, obcompressed, thick, drupaceous, glabrous, about 7 mm. long, crowned with a pair of short, thick teeth.

79. THELESPERMA Less. Linnaea 6: 511. 1831.**1. Thelesperma longipes** A. Gray, Pl. Wright. 1: 109. 1852.

Coahuila, Nuevo Leon, and San Luis Potosí. Texas to Arizona; type from the San Pedro River, Texas.

Suffrutescent, 15 to 40 cm. high, much branched at base, nearly glabrous, very leafy; leaves opposite, 2.5 to 7 cm. long, pinnately parted into 3 or 5 filiform or linear-filiform lobes as wide as the rachis, or the upper entire; heads discoid, yellow, 7 to 10 mm. wide, solitary at apex of slender naked peduncles 9 to 24 cm. long; involucre double, the outer of small lance-ovate herbaceous phyllaries, the inner of submembranous dark phyllaries, these connate about to middle, with scarious yellow border; achenes thickened, curved, about 2.5 mm. long, muricate; pappus an obscure border, sometimes produced into 2 very short teeth. "Hierba de San Nicolás" (Nuevo León).

80. BIDENS L. Sp. Pl. 831. 1753.

Herbs, rarely suffrutescent; leaves mostly opposite; heads few to numerous, in ours yellow and radiate; involucre double, as in *Coreopsis*; achenes (in ours) linear, flattened or subquadrangular; pappus usually of 2 to 4 commonly retrorse-hispid awns.

Leaves dissected into linear-filiform segments.....1. **B. nudata.**

Leaves pinnately parted into 3 or 5 ovate to lanceolate divisions, rarely undivided.

2. **B. squarrosa.****1. Bidens nudata** T. S. Brandeg. Zoe 1: 309. 1890.

Cape Region of Baja California (Sierra de San Francisquito).

Suffrutescent, about 60 cm. high, essentially naked above, trichotomously branched, glabrous; leaves petiolate, 5 to 10 cm. long, twice or thrice pinnatisect into linear-filiform segments less than 1 mm. wide, as broad as the rachis; heads about 3, long-peduncled, yellow, radiate, about 1.5 cm. wide; rays pistillate; achenes linear, subquadrangular, about 6 mm. long; pappus of 2 or 3 retrorsely hispid awns about 3 mm. long.

2. Bidens squarrosa H. B. K. Nov. Gen. & Sp. 4: 238. 1820.*Bidens tereticaulis* DC. Prodr. 5: 598. 1836.*Bidens antiquensis* Coulter, Bot. Gaz. 16: 100. 1891.*Bidens tereticaulis sordida* Greenm. Proc. Amer. Acad. 39: 115. 1903.*Bidens tereticaulis indivisa* Robinson, Proc. Bost. Soc. Nat. Hist. 31: 270. 1904.*Bidens coreopsidis procumbens* Donn. Smith, Bot. Gaz. 42: 299. 1906.

Tamaulipas to Chiapas. Guatemala to South America; type collected between Caracas and Mount Buenavista, Venezuela.

Suffrutescent or herbaceous, scandent; stem glabrous or pubescent; leaves petioled, the divisions lanceolate to ovate, 2.5 to 9 cm. long, acute to attenuate, closely serrate; heads usually numerous, cymose-panicled, slender-pedicelled, 4.5 cm. wide or less; achenes linear, ciliate, the 2 awns spreading or recurved, retrorse-hispid or smooth. "Flor de colmena" (El Salvador).

81. COSMOS Cav. Icon. Pl. 1: 9. pl. 14. 1791.

Herbs, rarely suffrutescent; leaves opposite, entire to dissected; heads radiate, purple, pink, white, or yellow; involucre double, as in *Coreopsis*; rays neutral; achenes obcompressed or angulate, more or less distinctly rostrate; pappus of 2 to 9 retrorsely hispid awns.

An herbaceous species of this genus is much cultivated as an ornamental plant under the name "cosmos."

Rays purple.

Leaves narrowly linear and entire to bipinnatisect with linear divisions, these more than 1 mm. wide..... 1. *C. crithmifolius*.

Leaves pinnatisect, the lobes linear-filiform, 0.7 mm. wide or less.

2. *C. seemannii*.

Rays yellow..... 3. *C. landii*.

1. *Cosmos crithmifolius* H. B. K. Nov. Gen. & Sp. 4: 242. 1820.

Bidens valladolidensis Schultz Bip. in Seem. Bot. Voy. Herald 308. 1856.

Sinaloa to Oaxaca; type from Valladolid (Morelia), Michoacán.

Suffrutescent, 50 to 90 cm. high, slender, glabrous; leaves 3.5 to 12 cm. long, narrowly linear (1.5 to 4 mm. wide) and entire, or pinnatisect to bipinnatisect, rough-margined; heads few or solitary, long-peduncled, 2 to 4.5 cm. wide; disk yellow; achenes linear-fusiform, angled; pappus of usually 4 awns. "Gallitos" (Sinaloa).

2. *Cosmos seemannii* (Schultz Bip.) A. Gray, Proc. Amer. Acad. 19: 16. 1883.

Bidens seemannii Schultz Bip. in Seem. Bot. Voy. Herald 307. 1856.

Tepic and Michoacán; type from the Sierra Madre.

Suffrutescent, about 60 cm. high, minutely hirtellous, leafy; leaves about 5 cm. long, twice or thrice pinnatisect with very narrow divisions; heads 1 to 7, long-peduncled, 2.5 to 4.5 cm. wide; disk corollas purplish on the teeth; awns 6 to 9.

3. *Cosmos landii* Sherff, Bot. Gaz. 64: 29. 1917.

Bidens palmeri A. Gray in S. Wats. Proc. Amer. Acad. 22: 429. 1887. Not

Cosmos palmeri Robinson, 1909.

Jalisco; type from Río Blanco.

Suffrutescent, about 1 meter high, glabrous; leaves 4 to 6 cm. long, pinnatisect or bipinnatisect, the segments linear, 1 to 2 mm. wide, rough-margined; heads several, long-peduncled, 2.3 to 3.8 cm. wide; flowers all yellow; achenes rostrate; awns 2 to 4.

82. CALEA L. Sp. Pl. ed. 2. 1179. 1763.

REFERENCE: Robinson & Greenman, Revision of the Mexican and Central American species of the genus *Calea*, Proc. Amer. Acad. 32: 20-30. 1896.

Shrubs or sometimes herbs; leaves opposite; heads radiate or discoid, yellow or white, usually cymose; involucre several-seriate, graduate, the phyllaries dry or the outer sometimes herbaceous; rays if present fertile; achenes subterete or 4 or 5-angled; pappus persistent, of 4 to 20 usually equal, paleaceous squamellae or awns, rarely entirely wanting.

Pappus awns or squamellae 4 or 5.

Leaves densely tomentose or tomentulose beneath; heads 1 to 5, rather large (about 1.8 cm. wide).

Leaves ovate, subcordate, densely canescent-tomentose beneath; heads solitary.....14. *C. grayii*.

Leaves ovate-oblong, not subcordate, very finely tomentulose beneath; heads about 5.....15. *C. discolor*.

Leaves green beneath; heads numerous, or if few, then small.

Leaves small, the blades at most 2.5 cm. long, 7 mm. wide; heads few, small, in a naked terminal cymose panicle.....16. *C. brandegei*.

Leaves larger, 4 cm. long or more; heads numerous.

Leaves with conspicuous stipule-like auriculations at base.

17. *C. manicata*.

Leaves without stipule-like auriculations at base.

Leaves oblong, 7.5 cm. wide, pilose on the nerves beneath.

18. *C. orizabaensis*.

Leaves lanceolate or oblanceolate, 1.5 to 3.5 cm. wide, glabrous.

20. *C. pachyphylla*.

Pappus awns or squamellae 7 to 20.

Pappus awns as long as or longer than the achene.

Rays white or whitish, conspicuous.

Phyllaries ciliate, otherwise essentially glabrous.....8. *C. integrifolia*.

Phyllaries rather densely pubescent dorsally.

Leaves thickish, scabrous, green in drying.....9. *C. scabrifolia*.

Leaves thin, nearly smooth, blackening in drying.

10. *C. submembranacea*.

Rays yellow or wanting.

Heads 2 to 13, rather large; pedicels 3 to 10 cm. long.

11. *C. longipedicellata*.

Heads numerous, rather small, umbellate-clustered, usually short-pedicel or sessile.

Heads distinctly radiate.....12. *C. urticifolia*.

Heads discoid.....13. *C. trichotoma*.

Pappus awns or squamellae shorter than the achene.

Leaves densely cinereous- or griseous-tomentose or -tomentulose beneath.

Outer phyllaries without distinct herbaceous tips.....4. *C. pringlei*.

Outer phyllaries with conspicuous herbaceous tips.

Leaves broadly ovate, about two-thirds as wide as long; pappus squamellae acutish.....2. *C. albida*.

Leaves suborbicular, about as wide as long; pappus squamellae obtuse.

3. *C. hypoleuca*.

Leaves green and not densely pubescent beneath.

Pedicels mostly considerably longer than the heads.

Heads discoid, 8 to 14-flowered.....1. *C. salmeaefolia*.

Heads radiate, with more numerous flowers.

Leaves ovate, half as wide as long.....19. *C. rupestris*.

Leaves cuneate-obovate or oblanceolate, less than half as wide as long.....20. *C. pachyphylla*.

Pedicels mostly much shorter than the heads or obsolete.

Leaves glabrous and not gland-dotted beneath.....5. *C. nelsonii*.

Leaves pubescent or gland-dotted beneath.

Heads subcylindric, 4 or 5-flowered.....6. *C. leptcephala*.

Heads turbinate or subcampanulate, 5 to 12-flowered.

7. *C. zacatechichi*.

1. *Calea salmeaeifolia* (DC.) Hemsl. Biol. Centr. Amer. Bot. **2**: 206. 1881, as *C. salmieaeifolia*.
Calydermos salmeaeifolius DC. Prodr. **5**: 670. 1836.
Tamaulipas.
Shrubby, about 1 meter high; branches slender, retrorse-puberulous in lines; leaves short-petioled, the blades ovate, about 3 cm. long, acuminate or acute, few-toothed, smoothish and lucid above, gland-dotted and sparsely pubescent beneath; heads umbellate, about 6 mm. high; pedicels 9 to 18 mm. long; squamellae 0.5 mm. long.
2. *Calea albida* A. Gray, Proc. Amer. Acad. **15**: 38. 1879.
San Luis Potosí; type from Morales.
Shrub; branches densely sordid-pilose; leaf blades ovate, 2.5 to 3.7 cm. long, 1.3 to 2.3 cm. wide, acute, coarsely toothed, rough above, gland-dotted and loosely griseous-pilose beneath; heads cymose-umbellate, about 8 mm. high, about 20-flowered; flowers whitish; achenes about 3.5 mm. long, the pappus about 1.5 mm. long.
3. *Calea hypoleuca* Robins. & Greenm. Proc. Amer. Acad. **32**: 24. 1896.
Oaxaca; type from Sierra de San Felipe.
Similar to *C. albida*; leaves larger, 3 to 5 cm. long and wide, densely pilose-tomentose beneath, subsessile or short-petioled. "Cuanaxana" (*Reko*).
4. *Calea pringlei* Robinson, Proc. Amer. Acad. **36**: 488. 1901.
Guerrero and Morelos; type from Iguala, Guerrero.
Frutescent, sordidly pilose-tomentose, glabrescent; leaves subsessile, suborbicular-ovate or broadly deltoid-ovate, the larger 2 to 4.5 cm. long and wide, rugose above, cinereously pilose-tomentose beneath; heads 7 to 10-flowered, in dense umbelliform cymose panicles.
- 4a. *Calea pringlei rubida* Greenm. Field Mus. Bot. **2**: 272. 1907.
Known only from the type locality, near Chavarillo, Veraacruz.
Leaves short-petioled, ovate, 1.5 to 3 cm. long, two-thirds as wide; phyllaries reddish-margined. (Description compiled.)
5. *Calea nelsonii* Robins. & Greenm. Proc. Amer. Acad. **32**: 25. 1896.
Known only from the type locality, ridge back of Tonalá, Chiapas.
Frutescent, glabrous; leaves short-petioled, the blades rhombic-ovate, 4.5 to 7.5 cm. long, 1.8 to 6 cm. wide, coarsely toothed, glabrous and eglandular on both sides; heads numerous, in umbelliform cymes, about 10-flowered; ray flowers 2 or 3, obscurely ligulate.
6. *Calea leptcephala* Blake, Contr. U. S. Nat. Herb. **22**: 646. 1924.
Known only from the type locality, Tonameca, Oaxaca.
Shrub; stem puberulous in lines, glabrate; leaves petioled, the blades ovate, 5.5 to 8.5 cm. long, 3.5 to 5 cm. wide, acuminate, coarsely toothed, beneath gland-dotted and on the veins sparsely pilosulous; heads in small clusters at tips of branchlets, the disk 6.5 mm. high, 2 mm. thick; phyllaries with involucre-margined spreading apex; ray 1, small.
7. *Calea zacatechichi* Schlecht. Linnaea **9**: 589. 1834.
San Luis Potosí and Jalisco to Veraacruz and Puebla; type from Hacienda de la Laguna and Jalapa, Veraacruz. Guatemala.
Much-branched shrub, puberulous or pubescent; leaves short-petioled, the blades ovate or broadly triangular-ovate, 2 to 6.5 cm. long, coarsely toothed, veiny, gland-dotted and more or less pubescent beneath; heads small, about 12-flowered, in dense umbellate-cymose panicles; phyllaries without spreading tips. "Tziein," "xicin" (Yucatán, Maya); "zacatechichi," "sacatechichi," "sacachichie," "zacachichi," "zacatechi" (from the Nahuatl, *zaca-chichic*,

bitter-grass); "juralillo;" "zacate amargo," "simonillo," "falso simonillo," "bejuco chismuyo" (El Salvador).

The plant is bitter, and has been employed in Mexico as a remedy for affections of the stomach, cholera, and malaria.

7a. *Calea zacatechichi rugosa* (DC.) Robins. & Greenm. Proc. Amer. Acad. **32**: 26. 1896.

Calydermos rugosus DC. Prodr. **5**: 670. 1836.

Calea rugosa Hemsl. Biol. Centr. Amer. Bot. **2**: 206. 1881.

Morelos and Veracruz (Orizaba); type from Cuernavaca, Morelos.

Similar; heads smaller, about 5-flowered.

7b. *Calea zacatechichi calyculata* Robinson, Proc. Amer. Acad. **36**: 488. 1901.

Sierra Madre near Monterrey, Nuevo León.

Similar to the typical form; involucre subtended by 2 or 3 herbaceous-tipped bracts.

8. *Calea integrifolia* (DC.) Hemsl. Biol. Centr. Amer. Bot. **2**: 205. 1881.

Allocaurus integrifolius DC. Prodr. **5**: 676. 1836.

Calea integrifolia dentata Coulter, Bot. Gaz. **20**: 51. 1895.

Veracruz and Michoacán (or Guerrero) to Chiapas; type from Mexico, without definite locality. Guatemala, El Salvador, Nicaragua.

Shrub up to 2.5 meters high, pubescent or nearly glabrous; leaves short-petioled, the blades ovate or lance-ovate, 5 to 12 cm. long, 1.5 to 4 cm. wide, acute to long-acuminate, serrate or serrulate, usually rough above, from essentially glabrous to rather densely pubescent beneath; heads 8 to 10 mm. wide, very numerous in close cymose panicles, 15 to 20-flowered; disk yellow, the 5 rays white; ray achenes epappose; disk achenes about 1 mm. long, their pappus 3 mm. long. "Simineontra" (El Salvador, *Pittier*).

9. *Calea scabrifolia* (Hook. & Arn.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. **2**: 206. 1881.

Allocaurus scabrifolius Hook. & Arn. Bot. Beechey Voy. 300. 1840.

Ferdinanda oppositifolia Schultz Bip. in Seem. Bot. Voy. Herald 303. 1856.

Zaluzania oppositifolia Schultz Bip. Flora **44**: 562. 1861.

Perymenium album S. Wats. Proc. Amer. Acad. **25**: 154. 1890.

Sinaloa to Jalisco and Durango; type from Jalisco.

Shrub, densely pubescent in the inflorescence, the branches pubescent or essentially glabrous; leaves short-petioled, the blades oblong-ovate, ovate, or lance-ovate, 4.5 to 10 cm. long, acuminate, very rough above, sparsely pubescent or essentially glabrous beneath; heads numerous, paniced, 1.5 to 2.5 cm. wide; rays about 18 to 25, white, the disk yellow; ray achenes epappose; disk achenes about 1.5 mm. long, their pappus 2.5 mm. long, or sometimes wanting. "Hierba del becerro" (*Ramírez*).

10. *Calea submembranacea* Fernald, Bot. Gaz. **20**: 535. 1895.

Known only from the type locality, Zopilote, Tepic.

Similar to *C. scabrifolia*; stem sparingly villous; leaves submembranaceous, smoothish, nigrescent in drying. (Description compiled.)

11. *Calea longipedicellata* Robins. & Greenm. Proc. Amer. Acad. **32**: 28. 1896.

Chiapas; type from Choapam. Guatemala.

Shrubby or subherbaceous, 1 to 2 meters high, glabrous throughout except for the puberulous tips of the pedicels; leaves short-petioled, the blades elliptic, 3.7 to 5 cm. long, coriaceous, denticulate; heads about 1 cm. long, discoid, orange-yellow; achenes 2 mm. long, the pappus 6 mm. long.

- 12. *Calea urticifolia*** (Mill.) DC. Prodr. 5: 674. 1836, as *C. urticaefolia*.
Solidago urticifolia Mill. Gard. Dict. ed. 8. *Solidago* no. 30. 1768.
Caleacte urticifolia R. Br. Trans. Linn. Soc. 12: 109. 1817.
Calea axillaris urticaefolia Robins. & Greenm. Proc. Amer. Acad. 32: 27. 1896.
 Tepic and Veraacruz to Chiapas; type from Veraacruz. Guatemala to Panama.
 Shrub 3 meters high or less, more or less pubescent; leaves petioled, the blades ovate, 5 to 12 cm. long, 2 to 6 cm. wide, acute, serrate, veiny, rough above and often beneath; heads about 1 cm. wide, numerous in terminal and axillary umbelliform panicles; outer phyllaries usually herbaceous-tipped; achenes about 2.5 mm. long; pappus about 3.5 mm. long. "Quinina" (Chiapas); "tacote" (Tepic); "hierba de la paloma" (*Urbina*); "pashecuane" (Otomí); "hierba de la rabia" (Chiapas, Oaxaca); "chichiquizo," "hoja amarga" (Oaxaca, Chiapas); "jalacate" (Costa Rica).
- 12a. *Calea urticifolia axillaris*** (DC.) Blake, Contr. Gray Herb. n. ser. 52: 57. 1917.
Mocinna serrata Lag. Gen. & Sp. Nov. 31. 1816.
Galinsogea serrata Spreng. Syst. Veg. 3: 579. 1826.
Calea axillaris DC. Prodr. 5: 673. 1836.
 Durango, San Luis Potosí, and Veraacruz; type locality not definitely stated.
 Similar; leaf blades elliptic-lanceolate or lance-ovate, acuminate, 3.5 to 8 cm. long, 1 to 2.5 cm. wide. "Xalacatl;" "chilehaea" (San Luis Potosí); "ponchishui" (*Urbina*).
- 13. *Calea trichotoma*** Donn. Smith, Bot. Gaz. 13: 299. 1888.
 Chiapas. Guatemala; type from Cobán.
 Reclining or subscaudent (?) shrub, 3 meters high or less; branches densely sordid-pubescent; leaves short-petioled, the blades ovate, 3 to 5.5 cm. long, obtuse or acute, griseously pilose-tomentose beneath; heads several or numerous, in close umbellate cymes or cymose panicles; outer phyllaries herbaceous at least above; achenes about 2.5 mm. long, the pappus about 5 mm. long.
- 14. *Calea grayii*** Klatt, Leopoldina 20: 96. 1884.
Calea tomentosa A. Gray, Proc. Amer. Acad. 15: 38. 1879. Not *C. tomentosa* Gardn. 1848.
 Known only from the type locality, between San Luis Potosí and Tampico.
 Branches densely canescent-tomentose; leaves slender-petioled, the blades ovate, entire, rounded, veiny, glabrate above, densely canescent-tomentose beneath; peduncles densely tomentose; heads radiate; involucre tomentose; pappus of 5 lanceolate paleae, half as long as the achene. (Description compiled.)
- 15. *Calea discolor*** A. Gray, Proc. Amer. Acad. 15: 38. 1879.
 Known only from the type, collected in Mexico without definite locality.
 Branches minutely incano-tomentose; leaves petioled, the blades ovate-oblong, obtusish, entire, glabrous above, finely whitish-tomentulose beneath; heads radiate, about 1.8 cm. wide; involucre glabrous; pappus of 4 or 5 small subulate paleae. (Description compiled.)
- 16. *Calea brandegei*** Greenm. in T. S. Brandeg. Univ. Calif. Publ. Bot. 4: 280. 1912.
 Puebla; type from Cerro de Coatape.
 Shrub; branches cinereous-tomentulose, glabrate, nearly naked above; leaves petioled, the blades elliptic or linear-lanceolate, 1.5 to 2.5 cm. long, 2 to 7 mm. wide, acutish, entire, glabrate; heads yellow, about 8 mm. wide; rays 8 to 10; achenes about 2 mm. long; pappus (of ray and disk) of 4 unequal, linear, bristle-like, lacerate squamellae or awns, 1 mm. long or less.

17. *Calea manicata* (Schlecht.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 206. 1881.

Tetrachyron manicatum Schlecht. Linnaea 19: 744. 1847.

Veracruz; type from temperate Mexico, without definite locality.

Shrub up to 4 meters high, nearly glabrous; branchlets angulate; leaves lanceolate, 7 to 12 cm. long, 1.5 to 3.5 cm. wide, acuminate, sessile or short-petioled, auriculate-clasping at base, serrate; heads yellow, turbinate, radiate, numerous in flattish terminal panicles; rays about 12; pappus of 4 unequal paleaceous awns, half as long as the achenes or less.

18. *Calea orizabaensis* Klatt, Leopoldina 23: 145. 1887.

Tetrachyron orizabaense Schultz Bip.; Klatt, Leopoldina 23: 145. 1887, as synonym.

Volcán de Orizaba, altitude 2,440 to 3,050 meters.

Branches villous, pentagonal; lower leaves petioled, the blades 12.5 cm. long, 7.5 cm. wide, sinuate-undulate, pilose on the nerves beneath; rays 4 or 5; pappus awns 4, linear-lanceolate, shorter than the achene. (Description compiled.)

19. *Calea rupestris* T. S. Brandeg. Zoe 5: 258. 1908.

Puebla; type from Boca del Monte.

Small shrub; branches glabrous, striate; leaves petioled, the blades ovate, about 5 cm. long, 2 to 3 cm. wide, acute, serrulate, coriaceous, pilose on the nerves beneath; heads radiate, numerous in a flattish terminal panicle; achenes about 3 mm. long; pappus of about 7 to 10 unequal awns and squamellae, 1.2 mm. long or less.

20. *Calea pachyphylla* (Klatt) Blake, Contr. U. S. Nat. Herb. 22: 647. 1924.

Aspilia pachyphylla Klatt, Leopoldina 23: 143. 1887.

Actinomeris pachyphylla Schultz Bip.; Klatt, Leopoldina 23: 143. 1887, as synonym.

Altamirania pachyphylla Greenm. Proc. Amer. Acad. 39: 106. 1903.

Aspiliopsis pachyphylla Greenm. Bot. Gaz. 37: 222. 1904.

Oaxaca; type from Santa Gertrudis.

Suffrutescent, nearly glabrous throughout; leaves short-petioled, the blades cuneate-obovate or oblanceolate, 5 to 12 cm. long, 1.5 to 3.5 cm. wide, acute, serrate, coriaceous, feather-veined; heads about 8 in a subternate terminal panicle, radiate; achenes 3 to 4 mm. long; pappus of 2 or 3 awns 1.5 mm. long, and on each side between them 1 or 2 lacerate squamellae about half as long.

DOUBTFUL SPECIES.

- CALEA CACOSMOIDES Less. Linnaea 5: 157. 1830.

Known only from the type locality, near Jalapa, Veracruz.

Leaves obtuse or acute at base, sharply serrate, subglabrous, lucid above; heads cylindrical, radiate, about 12-flowered. (Description compiled.)

- CALEA LIEBMANNII Schultz Bip.; Klatt, Leopoldina 23: 145. 1887.

Known only from the type locality, Gualulu, Mexico.

Leaves petioled, the blades ovate-elliptic, 5 cm. long, 1.8 cm. wide, coriaceous, glabrous above, ferruginous and gland-dotted beneath; heads cylindrical, 6-flowered, short-pedicelled, umbellate-cymose; phyllaries somewhat reflexed at apex; pappus squamellae 10, short. (Description compiled.)

- CALEA SESSILIFLORA Less. Linnaea 5: 158. 1830.

Chrysosphaerium gnaphalioides Willd.; Less. Linnaea 5: 158. 1830, as synonym.

Mexico, without definite locality.

Shrub; leaves at base very obtuse and subcordate; heads cylindrical, discoid, 10-flowered. (Description compiled.)

83. **BEBBIA** Greene, Bull. Calif. Acad. 1: 179. 1885.1. **Bebbia juncea** (Benth.) Greene, Bull. Calif. Acad. 1: 180. 1885.*Carphephorus junceus* Benth. Bot. Voy. Sulph. 21. 1844.

Baja California and islands; Sonora; type from Magdalena Bay, Baja California, California to New Mexico.

Shrubby, 2.5 meters high or less, intricately branched, glabrous except on the involucre and the apex of the peduncles, strong-scented; leaves opposite below, alternate above, linear, about 3 cm. long or less, 2 mm. wide or less, entire or few-toothed, fleshy; heads solitary or few and cymose at tips of the long, nearly naked branches, discoid, yellow, 1 to 1.5 cm. wide; involucre strongly graduate, 5 to 8 mm. high, the outer phyllaries (2 or 3 series) oval, subherbaceous with scarious margins, obtuse or rounded, rarely acute, canescent-pubescent, the inner (about 2 series) thinner, subscarious; proper tube of the corollas densely stipitate-glandular; achenes somewhat compressed; pappus 1-seriate, of 20 plumose bristle-like awns more than twice as long as the achene.

1a. **Bebbia juncea aspera** Greene, Bull. Calif. Acad. 1: 180. 1885.*Bebbia aspera* A. Nels. Bot. Gaz. 37: 273. 1904.

Baja California and islands, Sinaloa, and Sonora. California, Nevada, and Arizona; type from "southeastern borders of California, and adjacent Arizona."

Similar; stem and leaves more or less densely hispidulous; phyllaries usually acute or acuminate.

1b. **Bebbia juncea atriplicifolia** (A. Gray) I. M. Johnston, Proc. Calif. Acad. IV. 2: 1197. 1924.*Carphephorus atriplicifolius* A. Gray, Proc. Amer. Acad. 5: 159. 1861.*Bebbia atriplicifolia* Greene, Bull. Calif. Acad. 1: 181. 1885.

Cape Region of Baja California; type from Cape San Lucas.

Stem hispidulous or sometimes glabrous; leaves petioled, the blades triangular-ovate, 2 to 5 cm. long, 0.6 to 4 cm. wide, hastately lobed or toothed; heads several or numerous, cymose-panicled; pedicels usually stipitate-glandular as well as hispidulous; involucre less pubescent, the phyllaries acute or acuminate.

84. **TRIDAX** L. Sp. Pl. 900. 1753.REFERENCE: Robinson & Greenman, Revision of the genus *Tridax*, Proc. Amer. Acad. 32: 4-10. 1896.

Herbaceous, rarely suffruticulose; leaves chiefly opposite, entire to pinnatisect; heads long-peduncled, radiate or rarely discoid; involucre 2 to several-seriate, the phyllaries usually scarious-margined; rays white, rosy, or yellow, more or less distinctly bilabiate, fertile; disk usually yellow; achenes turbinate, usually villous; pappus of plumose squamellae or awns.

Plant green; leaves lanceolate to ovate, toothed..... 1. **T. procumbens**.

Plant densely lanate-tomentose; leaves narrowly linear, entire.

2. **T. candidissima**.1. **Tridax procumbens** L. Sp. Pl. 900. 1753.*Balsisia elongata* Willd. Sp. Pl. 3: 2214. 1804.*Amellus pedunculatus* Ort.; Willd. Sp. Pl. 3: 2214. 1804, as synonym.*Balsisia divaricata* Cass. Ann. Sci. Nat. 23: 90. 1831.

Throughout Mexico; type from Veraacruz. West Indies; Guatemala to South America; introduced in Florida, India, and Mauritius.

Herbaceous or suffruticulose (?), procumbent, hirsute; leaves petioled, the blades lanceolate to ovate, 1 to 8 cm. long, 0.5 to 3 cm. wide, repand-toothed to sharply serrate, cuneate-based; involucre 2 or 3 seriate, the phyllaries oblong, acutish; rays creamy-yellowish or "white," the disk yellow; pappus awns 4 mm. long, about twice as long as the achene. "Cura-gusano" (Guatemala); "hierba del toro" (El Salvador).

In eastern Guatemala the leaves are placed on the flesh to kill carnivorous insect larvae.

1a. *Tridax procumbens ovatifolia* Robins. & Greenm. Proc. Amer. Acad. 32: 7. 1896.

Known only from the type locality, Yalalag, Oaxaca.

Similar, more softly pubescent; leaves ovate, finely serrate, about 1.8 cm. long, 1 cm. wide; phyllaries mostly broadly obovate.

2. *Tridax candidissima* A. Gray, Proc. Amer. Acad. 15: 39. 1879.

San Luis Potosí; type from Angostura.

Low, suffruticulose, ascending; leaves 2.5 to 5 cm. long, about 1.5 mm. wide, entire; heads solitary, discoid, yellow; achenes turbinate, densely silky; pappus of 20 slender plumose awns, three times as long as the achene.

85. *HEMIZONIA* DC. Prodr. 5: 692. 1836.

Herbs, rarely fruticose; leaves (in ours) opposite below, alternate above, entire or pinnatisect; heads (in ours) solitary or cymose-panicled, yellow, radiate; involucre 1-seriate, the phyllaries herbaceous above, scarious-margined and ampliate below and enfolding the gibbous subquadrangular rugose epappose ray achenes; receptacle bearing a single series of paleae between the rays and the disk flowers; disk (in ours) infertile, the achenes with a pappus of 6 to 12 awns or squamellae.

Leaves densely silky-strigose.....1. ***H. palmeri*.**
Leaves green.

Heads mostly solitary at tips of branchlets, forming a thyrse; leaves filiform.

2. ***H. frutescens*.**

Heads solitary at tips of branches, cymosely arranged; leaves linear or linear-lanceolate.....3. ***H. greeneana*.**

1. *Hemizonia palmeri* Rose, Contr. U. S. Nat. Herb. 1: 24. 1890.

Known only from the type locality, Guadalupe Island, Baja California.

Low, much branched, the woody stem becoming 1 cm. thick; leaves and young branches densely silky-strigose; leaves opposite below, crowded, oblanceolate or linear, 1 to 1.8 cm. long, 1.5 to 3 mm. wide, entire, acutish; heads about 1.2 cm. wide, densely panicled at ends of branches; rays 8; pappus of the disk achenes of 6 to 12 linear-lanceolate acuminate denticulate awns, longer than the achene.

2. *Hemizonia frutescens* A. Gray, Proc. Amer. Acad. 11: 79. 1876.

Known only from the type locality, Guadalupe Island, Baja California.

Fruticose, erect, about 60 cm. high, hirsute-pilose and glandular-viscid; flowering branches fastigiate, very leafy; leaves filiform, about 2.5 cm. long, 1 mm. wide, entire or with a pair of short lateral lobes; heads about 6 mm. high; rays 8 or 9; pappus of the disk achenes of 5 linear or subulate fimbriate-denticulate paleae.

3. *Hemizonia greeneana* Rose, Contr. U. S. Nat. Herb. 1: 24. 1890.

Known only from the type locality, Guadalupe Island, Baja California.

Suffruticose, 0.6 to 1 meter high, tufted, more or less pubescent and viscid; leaves of the sterile branches linear-lanceolate, 1.2 to 2 cm. long, pinnatisect with 6 to 8 lobes, or sometimes entire, those of the flowering branches linear, entire; rays 8; pappus of the disk achenes of 6 to 10 unequal paleaceous awns.

86. *JAUMEA* Pers. Syn. Pl. 2: 397. 1807.

REFERENCE: Rydberg, N. Amer. Fl. 34: 3. 1914.

1. *Jaumea peduncularis* (Hook. & Arn.) Oliver & Hiern.; Oliver, Fl. Trop. Afr. 3: 395. 1877.

Chaetymenia peduncularis Hook. & Arn. Bot. Beechey Voy. 298. pl. 62. 1837.

Jalisco and Tepic; type from Jalisco.

Shrubby, sparsely branched; stem glabrous except for hairy lines on the upper internodes; leaves opposite, linear-lanceolate, 8 to 12.5 cm. long, 7 to 17 mm. wide, acuminate, entire, ciliate toward base, triplinerved; heads solitary or ternate, yellow, radiate, 3 to 4 cm. wide, long-peduncled; involucre about 4-seriate, graduate, 1.5 cm. high, with ovate appressed phyllaries; achenes narrowly oblanceolate, about 8 mm. long; pappus of about 20 rigid barbate bristles, about 1 cm. long, slightly paleaceous-dilated at base.

87. VENEGASIA DC. Prodr. 6: 43. 1837.

REFERENCE: Rydberg, N. Amer. Fl. 34: 5. 1914.

1. Venegasia carpesioides deltoidea (Rydb.) Blake.

Venegasia deltoidea Rydb. N. Amer. Fl. 34: 5. 1914.

Known only from the type locality, Sauzal, Baja California.

Suffrutescent, 50 cm. high and more, somewhat puberulous; leaves alternate; petioles slender, about 2 cm. long; blades triangular-ovate, 5 to 8 cm. long, 2 to 3.8 cm. wide, acuminate, subtruncate to slightly cordate at base, dentate, thin; heads radiate, yellow, about 4 cm. wide, terminal and axillary, nodding in fruit, long-peduncled; involucre broad, about 3-seriate, about 1.2 cm. high, puberulous, the outer phyllaries connate below, oval or oblong, herbaceous, with spreading or reflexed tips, the inner membranous; receptacle hairy; achenes curved, about 3 mm. long, striate, glabrous, somewhat roughened, epappose.

88. CLAPPIA A. Gray in Torr. U. S. & Mex. Bound. Bot. 93. 1859.

REFERENCE: Rydberg, N. Amer. Fl. 34: 5. 1914.

1. Clappia suaedaefolia A. Gray in Torr. U. S. & Mex. Bound. Bot. 93. 1859.

Tamaulipas. Texas; type from Laredo.

Suffruticose or herbaceous, much branched from base, low, pale green, glabrous, very leafy; leaves alternate, linear or linear-filiform, 2 to 6 cm. long, 0.5 to 2.5 mm. wide, entire or trifid, fleshy, subterete or flattened; heads radiate, yellow, about 3 cm. wide, solitary at tips of upwardly thickened peduncles about 5 cm. long; involucre about 4-seriate, graduate, about 7 mm. high, the phyllaries oblong, rounded, glandular-vittate, thin-margined; receptacle densely paleaceous-setose; achenes ribbed, sparsely hispidulous, 3 mm. long; pappus of about 35 unequal, hispidulous, setiform paleae, connate at extreme base, about 5 mm. long.

89. PSILOSTROPHE DC. Prodr. 7: 261. 1838.

REFERENCE: Rydberg, N. Amer. Fl. 34: 6-9. 1914.

1. Psilostrophe cooperi (A. Gray) Greene, Pittonia 2: 176. 1891.

Riddellia cooperi A. Gray, Proc. Amer. Acad. 7: 358. 1868.

Northern Baja California. Nevada to California and Arizona; type from Fort Mohave, Arizona.

Shrub, forming clumps about 0.5 meter high; stem and branches densely pannose-tomentose; leaves alternate, linear or linear-oblanceolate, 2 to 5 cm. long, 1 to 4 mm. wide, entire, green in age; heads radiate, yellow, solitary or cymose-panicled, 1 to 2.5 cm. wide; involucre narrow, equal, woolly, of erect connivent phyllaries; rays about 5, broad, papery-persistent; achenes slender, nearly glabrous; pappus of several usually oblong, obtuse or acute, hyaline paleae.

The other species of this genus are herbaceous or sometimes indurate at base, but are never really frutescent.

90. *PERITYLE* Benth. Bot. Voy. Sulph. 23. pl. 15. 1844.¹

REFERENCE: Rydberg, N. Amer. Fl. 34: 12-19. 1914.

Herbs or undershrubs; leaves usually opposite at least below, petioled, entire to dissected; heads radiate or discoid, white or yellow; involucre sub-2-seriate, equal, the phyllaries carinate at least at maturity; rays fertile; disk corollas 4-toothed; achenes linear or oblong, strongly compressed, usually with distinct, white, callous, ciliate margins; pappus a crown of more or less connate squamellae, and usually 1 or 2 slender bristlelike awns, or rarely wanting.

Several of the species included in this treatment may be merely herbaceous.

Heads discoid.

Plant white-tomentose; heads numerous, naked-panicled..... 1. *P. incana*.

Plant green; heads solitary or few..... 6. *P. jaliscana*.

Heads radiate.

Leaves deeply cut or lobed.

Pappus awn 1, much shorter than the achene..... 7. *P. lineariloba*.

Pappus awns 1 or 2, as long as the achene.

Pappus awns 2; involucre cinereous-puberulent..... 8. *P. coronopifolia*.

Pappus awn 1; involucre hirsute or villous.

Leaf blades usually 5-lobed, very thin, nearly glabrous. 15. *P. lobata*.

Leaf blades 3-lobed, thickish, glandular-pubescent..... 16. *P. trisecta*.

Leaves not deeply cut or lobed.

Rays white, 2 to 4 mm. long; pappus awns 2 (rarely 1 or none).

Achenes glabrous on the faces; leaf blades nearly or quite entire, 1 to 3 cm. long..... 3. *P. rosei*.

Achenes pubescent on the faces; leaf blades usually coarsely toothed, if entire only 3 to 8 mm. long.

Leaf blades 3 to 8 mm. long, entire or 1 or 2-toothed on each side.

Petioles usually much longer than the blades; disk corollas merely glandular on the teeth..... 4. *P. hofmeisteria*.

Petioles shorter than the blades; disk corollas hirsute-pilose on the teeth..... 5. *P. trichodonta*.

Leaf blades 1 to 5 cm. long, coarsely dentate.... 2. *P. spilanthoides*.

Rays yellow, rarely white (?), 5 to 10 mm. long; pappus awn 1 or none.

Stems puberulent or glandular-puberulent.

Stem puberulent, obscurely if at all glandular; pappus awn as long as the achene or longer..... 9. *P. leptoglossa*.

Stem glandular-puberulent; pappus awn about one-third as long as the achene..... 10. *P. parryi*.

Stems viscid-villous.

Achenes strongly ciliate; pappus awn about twice as long as the achene. 11. *P. cordifolia*.

Achenes obscurely ciliate; pappus awn not twice as long as the achene, or wanting.

Leaves shallowly lobed, the lobes acutely toothed; squamellae well developed..... 12. *P. palmeri*.

Leaves dentate or doubly dentate, not lobed; squamellae minute or wanting.

Leaf blades 1 to 2.5 cm. long; pappus present..... 13. *P. lloydii*.

Leaf blades 4 to 7 cm. long; pappus wanting. 14. *P. grandifolia*.

¹ The related genus *Amauria* Benth. is described by Rydberg as consisting of suffruticose perennials, but the two known species are winter annuals.

1. **Perityle incana** A. Gray, Proc. Amer. Acad. 11: 78. 1876.

Nesothamnus incanus Rydb. N. Amer. Fl. 34: 12. 1914.

Known only from the type locality, Guadalupe Island, Baja California.

Shrub 1 meter high, densely and closely white-tomentose throughout; leaf blades 2.5 to 7 cm. long and wide, pinnately cut, the divisions bluntly lobed and toothed; heads about 6 mm. wide, very numerous in a naked pedunculate panicle; achenes rather densely pubescent and ciliate; pappus of squamellae, without awns.

2. **Perityle spilanthoides** (Schultz Bip.) Rydb. N. Amer. Fl. 34: 17. 1914.

Galinsogeopsis spilanthoides Schultz Bip. in Seem. Bot. Voy. Herald 307. 1856.

Pericome spilanthoides Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 215. 1881.

Perityle microcephala A. Gray, Proc. Amer. Acad. 21: 391. 1886.

Perityle saxosa T. S. Brandeg. Zoe 5: 225. 1905.

Sinaloa, Chihuahua, and Durango; type from the Sierra Madre of northwestern Mexico. Arizona.

Suffruticulose, lax or decumbent, much branched, up to 40 cm. long, griseous-puberulous; leaf blades 1 to 5 cm. long and wide; heads cymose-panicled; pappus a crown of squamellae and 1 or 2 awns, these shorter than the achene.

3. **Perityle rosei** Greenm. Proc. Amer. Acad. 40: 45. 1905.

Known only from the type locality, Sierra Madre west of Bolaños, Jalisco.

Suffruticulose, 10 to 20 cm. high, pilosulous; leaf blades deltoid-ovate, 1 to 3 cm. long, 0.5 to 2 cm. wide; pappus a crown of squamellae, and 2 awns about as long as the achene.

4. **Perityle hofmeisteria** Rydb. N. Amer. Fl. 34: 18. 1914.

Known only from the type locality, vicinity of City of Durango, Durango.

Suffruticulose, diffusely branched, about 15 cm. high, finely puberulent; petioles 5 to 14 mm. long; leaf blades ovate or rhombic-ovate, 3 to 8 mm. long; heads solitary, on peduncles 1 to 3 cm. long; involucre puberulous but green; pappus a crown of squamellae and 2 awns about as long as the achene.

5. **Perityle trichodonta** Blake, Proc. Biol. Soc. Washington 37: 60. 1924.

Known only from the type locality, Sierra Madre west of Bolaños, Jalisco.

Suffruticulose, 10 cm. high, densely griseous-puberulous; petioles about 2 mm. long; leaf blades ovate or rhombic-ovate, 3 to 5 mm. long; peduncles 1 cm. long or less; involucre griseous-pilosulous; pappus as in the last species.

6. **Perityle jaliscana** A. Gray in S. Wats. Proc. Amer. Acad. 22: 431. 1887.

Jalisco; type from Río Blanco.

Suffruticulose, loose or procumbent, up to 25 cm. long, puberulent; leaf blades deltoid-ovate, 1 to 1.8 cm. long, coarsely toothed, about equaling the petioles; heads axillary and terminal, discoid; achenes sometimes 1-carinate on the faces; pappus awns 1 mm. long or less; squamellae very short.

7. **Perityle lineariloba** Rydb. N. Amer. Fl. 34: 18. 1914.

Known only from the type locality, San Ramón, Durango.

Suffruticulose (?), decumbent, about 30 cm. long, puberulous; leaf blades triangular in outline, 2 to 4 cm. long, pinnately 3 to 5-parted with entire or lacinate-lobed divisions, very thin; peduncles 5 to 10 cm. long; rays white, about 4 mm. long.

8. **Perityle coronopifolia** A. Gray, Pl. Wright. 2: 82. 1853.

Laphamia coronopifolia Hemsl. Biol. Centr. Amer. Bot. 2: 210. 1881.

?*Laphamia scopulorum* Jones, Contr. West. Bot. 12: 48. 1908.

Chihuahua and Sonora. Arizona and New Mexico; type from Copper Mines, New Mexico.

Suffruticulose, many-stemmed, diffusely branched or erect, up to 25 cm. long, puberulous; leaf blades triangular, 3 to 12 mm. long, ternately pinnatisect, the primary divisions usually lobed or toothed; rays white, 3 to 6 mm. long.

9. *Perityle leptoglossa* Harv. & Gray, Mem. Amer. Acad. n. ser. 4: 77. 1849.
Leptopharynx leptoglossa Rydb. N. Amer. Fl. 34: 22. 1914.
 Sonora; type wrongly ascribed to California.
 Suffrutescent, branched, griseous-puberulous on the younger parts; leaf blades suborbicular, about 2 cm. wide, cordate at base, shallowly and obtusely lobed, the lobes crenate-toothed or crenate; heads about 1.5 to 2.3 cm. wide; rays apparently white; achenes ciliolate.
10. *Perityle parryi* A. Gray, Pl. Wright. 2: 106. 1853.
Laphamia parryi Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 210. 1881.
Leptopharynx parryi Rydb. N. Amer. Fl. 34: 22. 1914.
 Chihuahua. Texas; type from the Rio Grande.
 Similar to the last species; stem subglandular-puberulous; leaf blades crenate or slightly crenate-lobed; rays yellow; achenes ciliate.
11. *Perityle cordifolia* (Rydb.) Blake.
Leptopharynx cordifolia Rydb. N. Amer. Fl. 34: 22. 1914.
 Sonora and Sinaloa; type from Topolobampo, Sinaloa.
 Suffrutescent (?), low; leaf blades cordate-ovate, 1.5 to 3.2 cm. long, doubly crenate-dentate; heads about 2.5 cm. wide; rays probably yellow.
12. *Perityle palmeri* S. Wats. Proc. Amer. Acad. 24: 57. 1889.
Leptopharynx palmeri Rydb. N. Amer. Fl. 34: 23. 1914.
 Known only from the vicinity of the type locality, Guaymas, Sonora.
 Suffruticulose (?), about 25 cm. high; leaf blades cordate-ovate, 3 to 5 cm. long, thin, about equaling the petioles; heads about 2 cm. wide; rays yellow; pappus awn nearly twice as long as the achene.
13. *Perityle lloydii* Robins. & Fern. Proc. Amer. Acad. 30: 118. 1894.
Leptopharynx lloydii Rydb. N. Amer. Fl. 34: 22. 1914.
 Known only from the type locality, Badehuache, Sonora.
 Suffruticulose, 10 to 30 cm. high; leaf blades deltoid-ovate, doubly dentate, villous; heads about 1.5 cm. wide; rays pale yellow; pappus a minute crown of squamellae and 1 awn about equaling the achene.
14. *Perityle grandifolia* T. S. Brandeg. Zoe 5: 224. 1905.
Leptopharynx grandifolia Rydb. N. Amer. Fl. 34: 23. 1914.
 Known only from the type locality, Cerro Colorado, Sinaloa.
 Suffrutescent, 10 to 20 cm. high; leaf blades ovate, about equaling the petioles, crenate-serrate, cordate at base, thin; rays "yellow."
15. *Perityle lobata* (Rydb.) I. M. Johnston, Proc. Calif. Acad. IV. 12: 1205. 1924.
Leptopharynx lobata Rydb. N. Amer. Fl. 34: 23. 1914.
 Baja California; type from Coronado.
 Suffrutescent (?), about 10 cm. high; leaf blades orbicular-reniform in outline, 1.5 to 2.5 cm. wide, about equaling the petioles, the lobes oblong-obovate, doubly sinuate, dentate; rays yellow; pappus awn nearly twice as long as the achene.
16. *Perityle trisecta* Rydb.; Macbride, Contr. Gray Herb. n. ser. 56: 39. 1918.
Leptopharynx trisecta Rydb. N. Amer. Fl. 34: 23. 1914.
 Chihuahua; type from City of Chihuahua.
 Suffruticulose, much branched, up to 30 cm. high; leaf blades 1 to 3 cm. long, usually shorter than the petioles, deeply 3-lobed, the lobes toothed or crenate; rays pale yellow; pappus awn longer than the achene.

91. LAPHAMIA A. Gray, Pl. Wright. 1: 99. 1852.

REFERENCE: Rydberg, N. Amer. Fl. 34: 24-27. 1914.

1. *Laphamia dissecta* Torr.; A. Gray, Pl. Wright. 2: 81. 1853.
Laphamia lemmoni pedata A. Gray, Proc. Amer. Acad. 16: 101. 1880.
Phytyle dissecta A. Gray, Syn. Fl. 1²: 320. 1884.
Leptopharynx dissecta Rydb. N. Amer. Fl. 34: 24. 1914.

Niggerhead Mountains, along Arizona-Sonora boundary line. Texas and Arizona; type from Presidio del Norte, Texas.

Suffruticulose from a thick woody caudex, many-stemmed, about 15 cm. high, densely spreading-villous and glandular-puberulent, very leafy; leaf blades suborbicular-ovate in outline, 5 to 10 mm. long, about equaling the petioles, pedately trisect with lobed and toothed divisions; heads discoid, solitary, whitish, about 7 mm. wide; achenes linear-oblong, densely hispidulous, not distinctly ciliate, marginate all around (including apex); pappus awn 1, shorter than achene, or wanting; squamellae none.

Several other species of *Laphamia* occur near the Mexican boundary, and will doubtless be found in Mexico.

92. FLAVERIA [Juss.] J. F. Gmel. Syst. Nat. 2: 1269. 1791.REFERENCES: J. R. Johnston, A revision of the genus *Flaveria*, Proc. Amer. Acad. 39: 279-292. 1903; Rydb. N. Amer. Fl. 34: 142-146. 1915.

Herbaceous or suffrutescens, usually glabrous; leaves opposite, sessile, narrow; heads yellow, small, in close cymose panicles or glomerules; involucre 1-seriate, of 1 to 8 phyllaries, sometimes with a few bractlets at base; ray 1 or wanting; achenes oblong, 10-ribbed; pappus (in ours) none.

Phyllaries 3 or 4; ligule 5 mm. long.....1. *F. vaginata*.
 Phyllaries 5; ligule 2 mm. long.....2. *F. linearis*.

1. *Flaveria vaginata* Robins. & Greenm. Proc. Amer. Acad. 32: 48. 1896.

Known only from the type locality, between Coixlahuaca and Tamazulapan, Oaxaca.

Suffrutescens (?), many-stemmed from a thick woody root, about 20 cm. high, prostrate to ascending; internodes very short, pubescent in lines; leaves linear-lanceolate, 2 to 3 cm. long, attenuate, entire; heads 6 to 8-flowered, closely aggregated; ray achene 2.2 mm., disk achenes 1.8 mm. long.

2. *Flaveria linearis* Lag. Gen. & Sp. Nov. 33. 1816.

Flaveria maritima H. B. K. Nov. Gen. & Sp. 4: 285. 1820.

Selloa nudata Nutt. Amer. Journ. Sci. I. 5: 300. 1822.

Flaveria tenuifolia Nutt. Journ. Acad. Phila. 7: 81. 1834.

Gymnosperma nudatum DC. Prodr. 5: 312. 1836.

Yucatán. Florida, Bahamas, and Cuba; type from Havana, Cuba.

Suffrutescens, glabrous, up to 80 cm. high, prostrate to erect; lower internodes short, the leaf bases persistent; leaves linear, 2 to 10 cm. long, 1 to 4 mm. wide, fleshy, entire; heads 2 to 7-flowered, crowded in small, ternately divided, cymose panicles, short-pedicled or sessile, about 5 mm. high; achenes equal, about 1.6 mm. long.

93. EUTETRAS A. Gray, Proc. Amer. Acad. 15: 39. 1879.

REFERENCE: Rydberg, N. Amer. Fl. 34: 30. 1914.

1. *Eutetras palmeri* A. Gray, Proc. Amer. Acad. 15: 40. 1879.

Eutetras pringlei Greenm. Proc. Amer. Acad. 41: 266. 1905.

Zacatecas to San Luis Potosí and Hidalgo; type from Angostura, San Luis Potosí.

Undershrub 10 to 25 cm. high, cinereous-puberulous, especially on the branches, and more or less glandular; leaves chiefly opposite, on slender petioles 0.5 to 3 cm. long, the blades deltoid-ovate, 1 to 4.5 cm. long, about as wide, acute, dentate-serrate or sinuate-dentate; heads 1 to 3, radiate, 1.2 to 2 cm. wide, white or rosy-tinted, on peduncles 2 to 5 cm. long; involucre 2-seriate, equal, 5 to 8 mm. high; achenes 4-angled, about 3 mm. long; pappus of 4 slender awns 2.5 to 5 mm. long, and 4 oblong squamellae 0.5 to 1 mm. long.

94. PALAFOXIA Lag. Gen. & Sp. Nov. 26. 1816.

REFERENCE: Rydberg, N. Amer. Fl. **34**: 62-63. 1914.

Palafoxia linearis leucophylla I. M. Johnston, Proc. Calif. Acad. IV. **12**: 1202. 1924.

Baja California; type from Carmen Island.

Suffrutescent, decumbent, up to 1 meter long, hispid and glandular; leaves alternate, linear or elliptic-linear, 1.5 to 3.5 cm. long, 2 to 6 mm. wide, short-petioled, obtuse, entire, canescent-strigose; heads few, discoid, turbinate, about 1.8 cm. high, flesh-colored; phyllaries 1-seriate, herbaceous; achenes linear-oblong, 4-angled, about 8 mm. long; pappus of 4 to 6 linear-oblong truncate scarious paleae with strong midrib, 5 mm. long.

95. ERIOPHYLLUM Lag. Gen. & Sp. Nov. 28. 1816.

REFERENCE: Rydberg, N. Amer. Fl. **34**: 82-96. 1915.

Eriophyllum tenuifolium Rydb. N. Amer. Fl. **34**: 96. 1915.

Eriophyllum crucigerum Rydb. N. Amer. Fl. **34**: 96. 1915.

Baja California and islands; Sonora. California and Arizona; type from California.

Frutescent or suffrutescent, up to 60 cm. high, densely white-tomentose on stem, branches, and involucre; leaves opposite below, alternate above, 0.6 to 3 cm. long, the blade usually deltoid-ovate in outline, pinnately 3 to several-lobed, usually green above, tomentose beneath, the segments usually linear and entire, revolute; heads small, yellow, in small umbelliform cymes or cymose panicles, sessile or pedicellate (pedicels sometimes 2 cm. long); phyllaries about 5, firm, about 4 mm. long; rays about 5; achenes pubescent and glandular to nearly glabrous, narrowly oblong or obovoid, about 2 mm. long; pappus about 0.8 mm. long, of several obtuse or acutish, unequal, paleaceous squamellae.

96. CHAENACTIS DC. Prodr. **5**: 659. 1836.

REFERENCE: Rydberg, N. Amer. Fl. **34**: 64-74. 1914.

1. *Chaenactis parishii* A. Gray, Proc. Amer. Acad. **20**: 299. 1885.

Northern Baja California. Southern California; type from southern border of California.

Suffrutescent, decumbent and much branched at base, up to 50 cm. high, white-tomentose, sometimes glabrescent above, stipitate-glandular above beneath the tomentum, leafy below; leaves alternate, 2 to 5 cm. long, the blades oblong-ovate, pinnatilobate, the lobes 3 to 6 pairs, linear, usually entire; heads solitary

or few, long-peduncled, discoid, ochroleucous or tinged with purplish, about 1.8 cm. high; phyllaries very unequal, linear; achenes nearly linear, densely pubescent, about 7 mm. long; pappus of about 13 linear acutish hyaline paleae about 5.5 mm. long.

97. BAHIA Lag. Gen. & Sp. Nov. 30. 1816.

REFERENCE: Rydberg, N. Amer. Fl. **34**: 34-37. 1914.

Herbaceous or suffruticose, usually cinereous or canescent-pubescent; leaves opposite, at least below, usually dissected; heads yellow, radiate, solitary at tips of branches or cymose-panicled; involucre 2 or 3-seriate, subequal, the inner phyllaries often with scarious colored tips or margins; achenes very slenderly clavate, substipitate, 4-angled, hirsute below, hirsutulous above; pappus of about 8 hyaline paleae, in ours rounded and with obscure or evident costa.

Leaves distinctly canescent-tomentose or canescent-pubescent beneath.

Lobes of the leaves very narrow, often again lobed, usually more than 3.

1. B. absinthifolia.

Lobes of the leaves linear-lanceolate to cuneate, usually 3 and entire.

1a. B. absinthifolia dealbata.

Leaves green or slightly cinereous beneath.

Pappus paleae suborbicular, nearly as wide as long.....**2. B. pringlei.**

Pappus paleae obovate, much longer than wide.....**3. B. xylopoda.**

1. Bahia absinthifolia Benth. Pl. Hartw. 18. 1839.

Coahuila and Durango to Aguascalientes and San Luis Potosí; type from Aguascalientes. Arizona and Texas.

Suffruticulose, up to 35 cm. high, cinereous-strigillose, whiter on the lower side of the leaves; leaves petioled, 2 to 5 cm. long, pinnatisect, the segments 2.5 mm. wide or less; heads several, pedunculate, about 1.8 cm. wide; involucre about 6 mm. high; achenes 4 mm. long; squamellae obovate, 1.5 mm. long.

1a. Bahia absinthifolia dealbata A. Gray, Pl. Wright. 1: 121. 1852.

Bahia dealbata A. Gray, Mem. Amer. Acad. n. ser. **4**: 99. 1849.

Picradeniopsis dealbata Woot. & Standl. Contr. U. S. Nat. Herb. **16**: 192. 1913.

Chihuahua, Coahuila, and Durango; type from valley between Mapimí and Guajuquilla, Chihuahua. Texas to Arizona.

Similar, but with less divided leaves with broader segments, these sometimes pannose-tomentose.

2. Bahia pringlei Greenm. Proc. Amer. Acad. **32**: 309. 1897.

Hidalgo; type from Tula.

Suffruticulose, procumbent at base, with slender rootstocks; stem cinerous-strigillose; leaves 2 to 3.5 cm. long, twice or thrice ternately pinnatisect, with narrowly linear divisions; heads about 2 cm. wide.

3. Bahia xylopoda Greenm. Proc. Amer. Acad. **34**: 577. 1899.

Bahia ehrenbergii Schultz Bip.; Rydb. N. Amer. Fl. **34**: 35. 1914.

Hidalgo; type from Pachuca.

Very similar to *B. pringlei* except for the difference in pappus.

98. LOXOTHYSANUS Robinson, Proc. Amer. Acad. **43**: 43. 1907.

Low shrubs; leaves opposite, broad, crenate or repand, slender-petioled; heads white, discoid; involucre 2-seriate, equal, the phyllaries subherbaceous, somewhat thin-margined and often with somewhat yellowish tips; achenes as in *Bahia*; pappus oblique, of about 8 paleae, the innermost longest, sometimes aristiform, the others blunt, the outermost shortest.

The following treatment includes all the known species.

Plants erect or ascending; pappus 1 to 1.8 mm. long.

Heads several or numerous, cymose or cymose-panicled on a common peduncle.

1. *L. sinuatus*.

Heads few or solitary, on long peduncles.....2. *L. pedunculatus*.

Plants procumbent; pappus usually less than 1 mm. long.....3. *L. filipes*.

1. *Loxothysanus sinuatus* (Less.) Robinson, Proc. Amer. Acad. 43: 43. 1907.

Bahia sinuata Less. Linnaea 5: 160. 1830.

Bahia? *nepetaefolia* A. Gray, Proc. Amer. Acad. 5: 184. 1861.

Tamaulipas, Puebla, and Veracruz; type from Hacienda de la Laguna, Veracruz.

Low puberulous shrub; petioles 1 to 4.5 cm. long; leaf blades broadly ovate or deltoid-ovate, 2.5 to 8 cm. long and wide, obtuse, coarsely repand or weakly 3-lobed, green above, griseous-puberulous or tomentulose beneath; heads about 7 mm. high, the pedicels 1.5 cm. long or less; longest palea of pappus 1.5 to 1.8 mm. long.

2. *Loxothysanus pedunculatus* Rydb. N. Amer. Fl. 34: 33. 1914.

San Luis Potosí; type from Tamasopo Canyon.

Similar to no. 1; heads less definitely cymose, the peduncles 2.5 to 7 cm. long; pappus 1 to 1.2 mm. long.

3. *Loxothysanus filipes* Robinson, Proc. Amer. Acad. 43: 44. 1907.

Veracruz; type from Zacuapan.

Small and procumbent; leaf blades suborbicular, 1 to 2 cm. long, repand-crenate; heads few; pappus 0.7 to 1.2 mm. long.

99. *DYSSODIA* Cav. Deser. Pl. 202. 1802.

REFERENCE: Rydb. N. Amer. Fl. 34: 160-179. 1915.

Herbs or shrubs, with oil glands; leaves opposite or alternate, entire to dissected; heads radiate or rarely discoid, yellow, rarely orange; involucre of usually connate and equal, glandular-punctate phyllaries, often with a calyculus at base; achenes slender; pappus of 5 to 20 paleae, these often aristate-dissected or awned.

Leaves lanceolate to spatulate, serrate or entire, not lobed.

Rays deep orange or brick-red.....1. *D. oaxacana*.

Rays yellow.

Leaves lanceolate or lance-ovate, 1.2 to 2 cm. wide.....2. *D. serratifolia*.

Leaves narrowly lanceolate, 2 to 8 mm. wide.....3. *D. integrifolia*.

Leaves usually pinnatisect, if rarely entire then acerose-filiform.

Involucre conspicuously calyculate by a series of outer phyllaries of different form or texture from the inner.

Primary divisions of at least the lower leaves lanceolate to ovate.

Leaves opposite essentially throughout.

Lateral lobes of the leaves distinctly stipitate, suborbicular, lacinate.

4. *D. speciosa*.

Lateral lobes of the leaves sessile, ovate, serrate...5. *D. aurantia*.

Leaves chiefly alternate.....6. *D. porophylloides*.

Primary divisions of the leaves linear or essentially so.

Pappus paleae dissected nearly to base into numerous bristles.

Outer phyllaries linear-lanceolate, acuminate; peduncles usually thickened under the heads; principal phyllaries essentially glabrous on back.....7. *D. tagetiflora*.

Outer phyllaries linear-spatulate or oblong, obtuse or acute; peduncles scarcely or not thickened under the heads; principal phyllaries more or less densely hirsute on back.....8. *D. pinnata*.

Pappus paleae 1-aristate from a bifid apex or awnless...10. *D. treculii*.

Involucre ecalyculate or with very short and minute outermost phyllaries.

Leaves acerose, entire; pappus paleae all dissected into 3 to 5 bristles.

9. *D. acerosa*.

Leaves pinnatisect; pappus paleae with 1 to 3 awns or awnless.

Plants canescent-tomentose.

Pappus paleae distinct.....16. *D. setifolia*.

Pappus paleae united into a cup.....17. *D. greggii*.

Plants glabrous to densely puberulous or cinereous-pilosulous.

Involucre densely puberulent or pruinose.

Principal phyllaries united essentially up to the short free tips, the margins of the outer principal ones not free.

Heads larger; involucre 6 mm. high, 5 to 7 mm. wide.

10. *D. treculii*.

Heads smaller; involucre 3.5 to 4.5 mm. high, 2 to 5 mm. wide.

11. *D. hartwegii*.

Principal phyllaries less completely united, the outer ones with margins free for half their length or more.....12. *D. pentachaeta*.

Involucre glabrous except for the ciliate margins of the phyllaries.

Principal phyllaries united essentially to the short free tips, the margins of the outer ones not free; accessory phyllaries (forming the calyculus) conspicuous.....10. *D. treculii*.

Principal phyllaries less completely united, the outer with margins free for half their length or more.

Pappus paleae all split into 3 to 5 awns.....15. *D. aurantiaca*.

Pappus paleae 1-awned or awnless.

Outer pappus paleae obtuse or acute, not aristate.

13. *D. berlandieri*.

Pappus paleae all aristate.....14. *D. thurberi*.

1. *Dyssodia oaxacana* Greenm. Field Mus. Bot. 2: 273. 1907.

Gymnolaena oaxacana Rydb. N. Amer. Fl. 34: 160. 1915.

Oaxaca; type from Almoloyas.

Shrub 1.3 to 2 meters high, slightly pubescent; leaves opposite, the blades elliptic-ovate, 1 to 4 cm. long, 4 to 11 mm. wide, acute, serrate, narrowed to a short petioliform base; heads solitary or few, about 1.8 cm. high; involucre about 1.4 cm. high, the phyllaries united nearly to apex; pappus paleae dissected into numerous bristles.

2. *Dyssodia serratifolia* DC. Prodr. 5: 641. 1836.

Hymenatherum serratifolium Hemsl. Biol. Centr. Amer. Bot. 2: 221. 1881.

Dyssodia sessilifolia A. Gray, Proc. Amer. Acad. 19: 37. 1883.

Gymnolaena serratifolia Rydb. N. Amer. Fl. 34: 161. 1915.

Oaxaca; type from Atitla.

Shrubby, essentially glabrous; leaves chiefly opposite, the blades 5 to 8 cm. long, acute, serrate, densely glandular-punctate; heads cymose, about 1.3 cm. wide; involucre 1 cm. high.

3. *Dyssodia integrifolia* A. Gray, Proc. Amer. Acad. 19: 37. 1883.

Gymnolaena integrifolia Rydb. N. Amer. Fl. 34: 161. 1915.

Puebla to Chiapas; type from Chiapas.

Similar to *D. serratifolia*; leaf blades 2.2 to 5 cm. long, acuminate, serrulate; heads mostly solitary; involucre 1.3 to 1.7 cm. high.

4. *Dyssodia speciosa* A. Gray, Proc. Amer. Acad. 5: 163. 1861.

Lebetina speciosa A. Nels. Bot. Gaz. 47: 435. 1909.

Clomenocoma speciosa Rydb. N. Amer. Fl. 34: 165. 1915.

Southern Baja California; type from Cape San Lucas.

Glabrous, weak shrub; leaves petioled, 2 to 4 cm. long, divided into 3 or 5 segments; heads solitary, long-peduncled, about 4.5 cm. wide; involucre broad, about 1.5 cm. high, with a calyculus of numerous filiform-subulate phyllaries half as long; pappus paleae dissected into numerous bristles.

5. *Dyssodia aurantia* (L.) Robinson, Proc. Amer. Acad. 49: 507. 1913.

Aster aurantius L. Sp. Pl. 877. 1753.

Dyssodia appendiculata Lag. Gen. & Sp. Nov. 29. 1816.

Clomenocoma aurantia Cass. Dict. Sci. Nat. 9: 416. 1817.

Clappia aurantiaca Benth. in Hook. Icon. Pl. 12: 3. pl. 1104. 1872.

Guerrero, Veracruz, and Oaxaca; type from Veracruz.

Shrub, essentially glabrous; leaves petioled, 2 to 5.5 cm. long, pinnatisect into 3 or 5 segments, the lateral sessile or short-stipitate, the terminal slender-stiped; involucre about 1.2 cm. high.

6. *Dyssodia porophylloides* A. Gray, Mem. Amer. Acad. n. ser. 5: 322. 1854.

Lebetina porophylloides A. Nels. Bot. Gaz. 47: 435. 1909.

Clomenocoma porophylloides Rydb. N. Amer. Fl. 34: 166. 1915.

Northern Baja California; Sonora. Arizona and southern California; type from San Felipe, California.

Suffrutescent, 0.3 to 1 meter high, glabrous; leaves short-petioled, 3 cm. long or less, deeply cut into 3 or 5 linear to lanceolate or euneate lobes, these entire or toothed; heads solitary, long-peduncled; involucre about 12 mm. high.

7. *Dyssodia tagetiflora* Lag. Gen. & Sp. Nov. 29. 1816.

Boebera fastigiata H. B. K. Nov. Gen. & Sp. 4: 198. 1820.

Boebera tagetiflora Spreng. Syst. Veg. 3: 545. 1826.

Jalisco to Veracruz, and Oaxaca; type from Mexico, without definite locality.

Suffrutescent or herbaceous, up to 90 cm. high, sparsely pubescent; leaves 2 to 4 cm. long, pinnatisect, the segments 3 to 13, linear or linear-oblongate, serrate, the lower ones smaller; heads terminating the branches, about 1.8 cm. wide, yellow, long-peduncled; involucre about 8 mm. high; pappus paleae dissected into numerous unequal bristles, the central one longest.

8. *Dyssodia pinnata* (Cav.) Robinson, Proc. Amer. Acad. 49: 508. 1913.

Aster pinnatus Cav. Icon. Pl. 3: 6. pl. 212. 1795.

Dyssodia pubescens Lag. Gen. & Sp. Nov. 29. 1816.

Dyssodia subintegerrima Lag. Gen. & Sp. Nov. 29. 1816.

Boebera pubescens Spreng. Syst. Veg. 3: 544. 1826.

Boebera subintegerrima Spreng. Syst. Veg. 3: 545. 1826.

Rosilla lutea Less. Syn. Gen. Comp. 245. 1832.

Boebera incana Lindl. Bot. Reg. 19: pl. 1602. 1833.

Dyssodia incana DC. Prodr. 5: 640. 1836.

Clomenocoma pinnata DC. Prodr. 5: 641. 1836.

Dyssodia integerrima Hemsl. Biol. Centr. Amer. Bot. 2: 219. 1881, as synonym.

Boebera pinnata Rydb. N. Amer. Fl. 34: 168. 1915.

Coahuila to Tamaulipas, south to Puebla and Veracruz.

Suffrutescent or herbaceous, 35 cm. high or less, pubescent; leaves 2 to 4 cm. long, pinnatisect, the segments usually 5 or 7, linear or narrowly linear-oblongate, entire or few-toothed; heads terminating branches, 2 to 2.8 cm. wide, yellow; involucre about 8 mm. high; pappus as in *D. tagetiflora*.

9. *Dyssodia acerosa* DC. Prodr. 5: 641. 1836.

Aciphyllaea acerosa A. Gray, Mem. Amer. Acad. n. ser. 4: 91. 1849.

Hymenatherum acerosum A. Gray, Pl. Wright. 1: 115. 1852.

Dyssodia fusca A. Nels. Bot. Gaz. 47: 436. 1909.

Sonora to Coahuila, south to Zacatecas, Hidalgo, and San Luis Potosí; type from San Luis Potosí. Texas to Arizona and Nevada.

Suffruticose, much branched, 20 cm. high or less, the branches finely hirtellous; leaves opposite at least below, acrose-filiform, 1 to 2 cm. long, 0.5 mm. wide or less, often with fascicles in their axils; heads solitary, subsessile, yellow, about 1.3 cm. wide; involucre about 6 mm. high, dotted with numerous glands; pappus paleae dissected into 3 to 7 bristles. "Hierba de San Nicolás" (Zacatecas); "contrayerba."

10. *Dyssodia treculii* (A. Gray) Robinson, Proc. Amer. Acad. **49**: 508. 1913.

Hymenatherum treculii A. Gray, Proc. Amer. Acad. **19**: 42. 1883.

Thymophylla treculii Small, Fl. Southeast. U. S. 1295. 1903.

Coahuila. Texas; type from southeastern Texas.

Suffruticose (?), branched, about 20 cm. high, glabrous or finely pruinose; leaves opposite below, 1 to 2 cm. long, pinnatisect, the lobes 3 to 6 pairs, linear-filiform, setose-tipped; heads campanulate, 1.3 to 1.7 cm. wide; calyculus evident, of lanceolate acuminate phyllaries; pappus of 5 short outer paleae and 5 bifid, aristate-tipped, much longer inner paleae.

11. *Dyssodia hartwegi* (A. Gray) Robinson, Proc. Amer. Acad. **49**: 507. 1913.

Hymenatherum hartwegi A. Gray, Pl. Wright. **1**: 117. 1852.

Tagetes aristata Klatt, Leopoldina **25**: 109. 1889.

Thymophylla hartwegi Woot. & Standl. Contr. U. S. Nat. Herb. **16**: 191. 1913.

Thymophylla pringlei Rydb. N. Amer. Fl. **34**: 177. 1915.

Chihuahua to Aguascalientes and San Luis Potosí; type from Aguascalientes. Arizona and New Mexico.

Similar to *D. treculii*; plant distinctly suffruticose; heads smaller, 0.8 to 1.2 cm. wide.

12. *Dyssodia pentachaeta* (DC.) Robinson, Proc. Amer. Acad. **49**: 507. 1913.

Hymenatherum pentachaetum DC. Prodr. **5**: 642. 1836.

Thymophylla puberula Rydb. N. Amer. Fl. **34**: 177. 1915.

Thymophylla canescens Rydb. N. Amer. Fl. **34**: 178. 1915.

Coahuila and Nuevo León, south to Hidalgo and San Luis Potosí; type from Monterrey, Nuevo León. Texas to Arizona.

Suffruticose, 8 to 25 cm. high, the numerous branches usually procumbent at base, puberulous to cinereous-pilosulous; leaves crowded, chiefly opposite, 5 to 25 mm. long, pinnatisect with linear-filiform, setose-tipped divisions; heads campanulate-subglobose, long-peduncled, 1.5 to 2.2 cm. wide; involucre 5 to 6 mm. high, densely puberulent or pilosulous. "Parraleña," "limoncillo" (Coahuila).

The cinereous form, *T. canescens*, is not specifically distinguishable.

13. *Dyssodia berlandieri* (DC.) Blake.

Hymenatherum berlandieri DC. Prodr. **5**: 642. 1836.

Thymophylla gracilis Rydb. N. Amer. Fl. **34**: 176. 1915.

Thymophylla berlandieri Rydb. N. Amer. Fl. **34**: 177. 1915.

Thymophylla villosula Rydb. N. Amer. Fl. **34**: 177. 1915.

Coahuila, Tamaulipas, and Nuevo León; type collected between Santander and Victoria, Tamaulipas. Texas.

Very similar to *D. pentachaeta* except for the involucre, which is glabrous except for the conspicuously ciliate margins of the phyllaries. This species also has a cinereous-pubescent form (*T. villosula*), which can not be separated specifically. "Manzanilla amarilla."

14. *Dyssodia thurberi* (A. Gray) A. Nels. Bot. Gaz. **47**: 436. 1909.

Hymenatherum thurberi A. Gray, Proc. Amer. Acad. **19**: 41. 1883.

Dyssodia cupulata A. Nels. Bot. Gaz. **47**: 435. 1909.

Thymophylla thurberi Woot. & Standl. Contr. U. S. Nat. Herb. **16**: 191. 1913.

Coahuila and Durango; type from Chihuahua. Texas to New Mexico and Nevada.

Similar to *D. pentachaeta*, and distinguished chiefly by the difference in pappus.

15. *Dyssodia aurantiaca* (T. S. Brandeg.) Robinson, Proc. Amer. Acad. **49**: 507. 1913.

Hymenatherum aurantiacum T. S. Brandeg. Zoe **5**: 258. 1908.

Thymophylla aurantiaca Rydb. N. Amer. Fl. **34**: 175. 1915.

Puebla; type from Cerro de Santa Lucía.

Suffruticulose, ascending, 10 to 20 cm. high, glabrous; leaves chiefly alternate, 1.5 to 3 cm. long, pinnatisect with soft, linear-filiform, merely cuspidulate divisions; heads 1.8 cm. wide; free portions of phyllaries ciliate; pappus paleae all split into 3 to 5 awns.

16. *Dyssodia setifolia* (Lag.) Robinson, Proc. Amer. Acad. **49**: 508. 1913.

Thymophylla setifolia Lag. Gen. & Sp. Nov. **25**. 1816.

Hymenatherum setifolium A. Gray, Proc. Amer. Acad. **19**: 42. 1883.

Hymenatherum setifolium radiatum T. S. Brandeg. Univ. Calif. Publ. Bot. **4**: 279. 1912.

Coahuila and Nuevo León, south to Querétaro; type from Mexico, without definite locality.

Suffruticulose, much branched, 7 to 20 cm. high, canescent-tomentose; leaves pinnatisect, with 3 to 7 lobes, rather soft, about 1.5 cm. long; heads small, discoid or rarely radiate; phyllaries with rather long triangular-subulate tips; pappus of 5 to 10 free paleae, all short and blunt or the inner sometimes aristate. "Parraleña."

17. *Dyssodia greggii* (A. Gray) Robinson, Proc. Amer. Acad. **49**: 507. 1913.

Thymophylla greggii A. Gray, Mem. Amer. Acad. n. ser. **4**: 92. 1849.

Thymophylla greggii radiata A. Gray, Pl. Wright. **1**: 119. 1852.

Hymenatherum greggii A. Gray, Proc. Amer. Acad. **19**: 42. 1883.

Coahuila; type from Buena Vista. Texas and New Mexico.

Similar to *D. setifolia*; leaves mostly trifid; heads usually radiate; pappus paleae completely connate.

100. POROPHYLLUM Adans. Fam. Pl. **2**: 122. 1763.

REFERENCES: Robinson & Greenman, A provisional key to the species of *Porophyllum* ranging north of the Isthmus of Panama, Proc. Amer. Acad. **32**: 31-33. 1896; Rydb. N. Amer. Fl. **34**: 181-193. 1916.

Shrubs or herbs, often glaucous, glabrous; leaves opposite or alternate, entire, sinuate, or rarely toothed, glandular-punctate on margin or apex and sometimes on surface; heads discoid, yellow, whitish, or purple; involucre of few equal, nearly 1-seriate, firm phyllaries, usually glandular-punctate; achenes slender; pappus of numerous bristles.

Leaves oval to elliptic, rarely lance-ovate, on distinct slender petioles.

Heads more or less distinctly nodding, several or numerous and racemously cymose or cymose-panicled at tips of branches; flowers greenish.

Leaves thick, veiny beneath..... **1. P. viridiflorum.**

Leaves thin, not veiny..... **2. P. nutans.**

Heads not nodding, cymose at tips of branches or solitary.

Corollas purple above..... **3. P. nelsonii.**

Corollas greenish or ochroleucous.

Heads solitary in the forks of the stem and at apex of branches, rarely paired..... **4. P. jorullense.**

Heads cymose.

Leaves lanceolate or lance-ovate, acute or acuminate; phyllaries acuminate..... **5. P. palmeri.**

Leaves oval to elliptic or oblong, usually obtuse or rounded.

Leaves oblong or elliptic-oblong.....6. *P. oblongum*.

Leaves oval or elliptic.

Phyllaries acuminate.....7. *P. ervendbergii*.

Phyllaries obtuse to acute.....8. *P. punctatum*.

Leaves linear-filiform to lanceolate or rarely oblanceolate or ovate-lanceolate, sessile or sometimes gradually narrowed at base into a short, usually margined petiole.

Leaves 3 or 5-dentate.....25. *P. tridentatum*.

Leaves entire.

Leaves ovate-lanceolate, semiamplexicaul, fleshy ...21. *P. amplexicaule*.

Leaves not amplexicaul.

Leaves oblanceolate or linear-lanceolate to linear, usually over 2 mm. wide, not terete.

Involucre green; heads short-peduncled, in close cymes.

Corollas whitish.

Lower leaves lanceolate.....9. *P. brachypodum*.

Leaves narrowly lance-linear.....10. *P. pausodynum*.

Corollas ochroleucous.

Heads 5 to 7-flowered; leaves narrowly linear...11. *P. confertum*.

Heads about 15-flowered; leaves linear-oblanceolate.

12. *P. ochroleucum*.

Involucre purple.

Plants diffuse; heads nodding.....13. *P. cedrense*.

Plants erect; heads very rarely nodding.

Corollas ochroleucous.....14. *P. obtusifolium*.

Corollas purplish.

Leaves linear.....15. *P. linaria*.

Leaves narrowly linear-lanceolate to oblanceolate.

16. *P. seemannii*.

Leaves linear-filiform or narrowly linear, rarely narrowly linear-elliptic, usually terete and less than 2 mm. wide, more or less fleshy.

Corollas purple.....17. *P. porphyreum*.

Corollas greenish yellow, ochroleucous, or whitish.

Phyllaries broadly oblong-oval or obovate.

Leaves filiform, 2 to 4 cm. long; involucre 1 to 1.2 cm. high.

23. *P. greggii*.

Leaves linear to elliptic, 2 cm. long or less; involucre 6 to 8 mm. high.....24. *P. crassifolium*.

Phyllaries linear or linear-oblong.

Leaves very fleshy, about 2 mm. wide; plant very glaucous.

20. *P. maritimum*.

Leaves scarcely fleshy, 1 mm. wide or less; plants usually not glaucous.

Achenes long-tapering at apex, about 8 mm. long.

18. *P. gracile*.

Achenes not distinctly tapering at apex, 4 to 6 mm. long.

Tube of the corollas longer than the throat.

19. *P. pinifolium*.

Tube of the corollas much shorter than the throat.

22. *P. scoparium*.

1. *Porophyllum viridiflorum* (H. B. K.) DC. Prodr. 5: 648. 1836.

Kleinia viridiflora H. B. K. Nov. Gen. & Sp. 4: 157. 1820.

Porophyllum lindenii Schultz Bip. in Seem. Bot. Voy. Herald 308. 1856.

- Tepec to Veracruz and Oaxaca; type from Valladolid (Morelia), Michoacán.
Shrub up to 1.5 meters high; leaves chiefly alternate, the blades oval, 1.5 to 4.5 cm. long, 1 to 3.5 cm. wide, pale green, marginate; heads 1.4 to 2 cm. long; phyllaries with a median row of glands.
2. *Porophyllum nutans* Robins. & Greenm. Proc. Amer. Acad. **32**: 31. 1896.
Porophyllum holwayanum Greenm. Proc. Amer. Acad. **40**: 48. 1904.
Jalisco to Oaxaca; type from Lake Chapala, Michoacán.
Shrubby, 1 to 2 meters high; leaf blades oval or oblong-elliptic, 2 to 5 cm. long, scarcely marginate, glandular along the margin; phyllaries with 2 rows of linear glands.
3. *Porophyllum nelsonii* Robins. & Greenm. Proc. Amer. Acad. **32**: 32. 1896.
Oaxaca; type collected between Panixtlahuaca and Jaquila.
Shrubby, 0.3 to 0.6 meter high; leaf blades elliptic or oblong, 1 to 1.8 cm. long, 4 to 6 mm. wide, obtuse, thickish, with few glands; heads numerous, solitary in forks of stem and at tips of branchlets, about 1.5 cm. high; involucre purplish above; phyllaries with 2 rows of linear glands.
4. *Porophyllum jorullense* (H. B. K.) Cass. Dict. Sci. Nat. **43**: 57. 1826.
Kleinia jorullensis H. B. K. Nov. Gen. & Sp. **4**: 156. *pl.* 356. 1820.
Sinaloa to Jalisco; type from Volcán de Jorullo.
Shrubby; leaf blades oval, 1 to 2.5 cm. long, obtuse or rounded; heads 1.3 to 1.5 cm. high, on peduncles 2 to 4.5 cm. long; phyllaries with 2 rows of linear glands.
5. *Porophyllum palmeri* Rose, Contr. U. S. Nat. Herb. **1**: 338. *pl.* 34. 1895.
Known only from the type locality, Colima.
Shrub; leaves opposite, the blades 1 to 4 cm. long; heads loosely cymose, about 15 mm. high; phyllaries with 2 rows of glands.
6. *Porophyllum oblongum* Rydb. N. Amer. Fl. **34**: 186. 1916.
Known only from the type locality, Culiacán, Sinaloa.
Shrub; leaf blades 2 to 4 cm. long, 0.5 to 1.5 cm. wide, obtuse or rounded, glandular on the repand-sinuate margin and usually on surface; heads cymose, about 1.6 cm. high; phyllaries with about 3 rows of glands.
7. *Porophyllum ervendbergii* A. Gray, Proc. Amer. Acad. **19**: 35. 1883.
Definitely known only from the type locality, Wartenberg, Veracruz.
Shrub; leaves opposite, the blades elliptic, 2 to 3 cm. long, obtuse, sinuate, glandular on margin and surface; involucre 11 to 12 mm. high, the phyllaries punctate in 2 rows. (Description compiled.)
8. *Porophyllum punctatum* (Mill.) Blake, Contr. Gray Herb. n. ser. **52**: 58. 1917.
Eupatorium punctatum Mill. Gard. Diet. ed. 8. *Eupatorium* no. 11. 1768.
Porophyllum nummularium DC. Prodr. **5**: 649. 1836.
Eupatorium milleri Steud. Nom. Bot. ed. 2. **1**: 608. 1840.
Porophyllum millspaughii Robinson in Millsp. Field Mus. Bot. **2**: 109. 1900.
Porophyllum divaricatum Rydb. N. Amer. Fl. **34**: 186. 1916.
Sinaloa to Veracruz, Yucatán, and Oaxaca; type from Veracruz. Guatemala.
Shrubby, up to 2.6 meters high; leaves opposite, the blades oblong or sometimes elliptic, 1 to 3.5 cm. long, obtuse or rounded, rarely acute, crenate, glandular on margin and usually also on surface; heads cymose, 1.3 to 1.8 cm. high; phyllaries with 2 rows of linear glands. "Hierba del venado," "pioja," "piojillo" (Sinaloa); "xpechuekil" (Yucatán, Maya).
9. *Porophyllum brachypodum* Robinson, Proc. Amer. Acad. **35**: 341. 1900.
Known only from the type locality, Guaymas, Sonora.
Shrubby; leaves alternate, short-petioled, the blades thick, those of the main leaves lanceolate, 3 to 4 cm. long, 4 to 8 mm. wide, the others mostly linear; heads densely cymose, about 1.5 cm. high; peduncles 5 to 8 mm. long.

10. *Porophyllum pausodinum* Robins. & Greenm. Proc. Amer. Acad. 32: 32. 1896.

Known only from the vicinity of the type locality, Guaymas, Sonora.

Shrubby; leaves opposite below, alternate above, short-petioled, the blades 2.5 to 5.5 cm. long, 2 to 5 mm. wide, acutish, with intramarginal glands; heads short-peduncled, 1.5 to 1.8 cm. high, in close cymes; phyllaries oblong, obtuse, with 2 to 4 rows of glands; achenes not tapering at apex. "Maravilla."

The plant is used as a remedy for headache.

11. *Porophyllum confertum* Greene, Leaflets 2: 155. 1911.

Known only from the type locality, Cerralvo Island, Gulf of California.

Suffruticose, erect; leaves mostly alternate, subsessile, the blades linear, 4 to 6 cm. long, less than 2 mm. wide; heads 1.3 cm. high; achenes tapering at apex.

12. *Porophyllum ochroleucum* Rydb. N. Amer. Fl. 34: 189. 1916.

Porophyllum confertum ochroleucum I. M. Johnston, Proc. Calif. Acad. IV. 12: 1209. 1924.

Known only from the type locality, Saucito, Baja California.

Shrubby, 0.5 meter high or more; leaves short-petioled, the blades narrowly oblanceolate, 3 to 5 cm. long, 2 to 4 mm. wide; heads densely cymose; phyllaries linear. (Description compiled.)

13. *Porophyllum cedrense* Rose & Standl.; Rydb. N. Amer. Fl. 34: 189. 1916.

Known only from the type locality, Cedros Island, Baja California.

Diffusely branched shrub, under 0.5 meter high; leaves alternate, sessile, the blades oblong, 1 to 2 cm. long, 2 to 5 mm. wide, obtuse; heads usually solitary, 1.5 cm. high; phyllaries oblong.

14. *Porophyllum obtusifolium* DC. Prodr. 5: 650. 1836.

Jalisco, Guanajuato, and Mexico; type from Villalpando.

Suffruticose, about 0.5 meter high; leaves short-petioled, the blades oblanceolate or oblanceolate-linear, 2 to 4 cm. long, 2 to 8 mm. wide, mostly obtuse; heads about 13 mm. high, cymose-panicled; involucre dark purplish; achenes not tapering at apex. "Hierba del venado" (Guanajuato).

15. *Porophyllum linaria* (Cav.) DC. Prodr. 5: 649. 1836.

Cacalia linaria Cav. Icon. Pl. 3: 29. pl. 257. 1795.

Hunteria columbina Moc. & Sessé; DC. Prodr. 5: 649. 1836, as synonym.

Porophyllum linarifolium St. Lag. Ann. Soc. Bot. Lyon 7: 132. 1880.

Coahuila to State of Mexico; type from Mexico, without definite locality.

Similar to *P. obtusifolium*; leaves narrowly linear, 1 to 2 mm. wide; flowers purple.

16. *Porophyllum seemanii* Schultz Bip. in Seem. Bot. Voy. Herald 308. 1856.

Sinaloa and Chihuahua to Jalisco; type from the Sierra Madre of northwestern Mexico.

Shrub; leaves opposite below, alternate above, short-petioled, the blades 2 to 5 cm. long, 2 to 5 mm. wide; heads 12 mm. high. "Hierba del venado" (Sinaloa); "maravilla" (Sonora).

Used as a remedy for malaria.

17. *Porophyllum porfyreum* Rose & Standl.; Rydb. N. Amer. Fl. 34: 191. 1916.

Known only from the type locality, San José del Cabo, Baja California.

Shrubby, very slender; leaves linear-filiform, 3 to 7 cm. long, 1 mm. wide or less; heads mostly solitary, 1.2 to 1.7 cm. high; involucre glaucous, purplish above.

18. *Porophyllum gracile* Benth. Bot. Voy. Sulph. 29. 1844.

Porophyllum caesium Greene, Leaflets 2: 155. 1911.

Baja California and islands; Sonora; type from Magdalena Bay, Baja California. Southern California.

Shrubby, much branched, sometimes glaucous; leaves linear or linear-filiform, 1 to 5.5 cm. long, 1.5 mm. wide or less; heads loosely cymose-panicled, 1.3 to 1.5 mm. high; phyllaries 2 mm. wide or less. "Hierba del venado" (Baja California).

The bitter decoction of the leaves is administered for intestinal affections.

19. *Porophyllum pinifolium* Rydb. N. Amer. Fl. 34: 192. 1916.

Sonora and Cape region of Baja California; type from Alamos, Sonora.

Low much-branched shrub; leaves linear-filiform, 2 to 4 cm. long, about 0.5 mm. wide; heads solitary; involuere light green; corollas cream-colored, purple-streaked.

20. *Porophyllum maritimum* T. S. Brandeg. Zoe 5: 162. 1903.

Southern Baja California; type collected between Cape San Lucas and San José del Cabo.

Low, shrubby, strongly glaucous; leaves thick, 2 to 3.8 cm. long, about 2 mm. wide; involuere strongly glaucous, 11 mm. high; achenes tapering above, about 8 mm. long.

21. *Porophyllum amplexicaule* Engelm.; A. Gray, Pl. Wright. 1: 120. 1852. Coahuila; type from Mesillas.

Suffruticose, glaucous; leaves ovate-lanceolate, 2 to 3 cm. long, about 8 mm. wide at base, semiamplexicaul, fleshy; heads solitary; flowers yellow. (Description compiled.)

22. *Porophyllum scoparium* A. Gray, Pl. Wright. 1: 119. 1852.

Porophyllum fruticosum Rydb. N. Amer. Fl. 34: 193. 1916.

Chihuahua and Coahuila. Texas and New Mexico; type from San Pedro River, Texas.

Shrubby, up to 60 cm. high, much branched, somewhat glaucous; leaves filiform or linear-filiform, 1 to 5.3 cm. long, 1 mm. wide or less; heads solitary at tips of branchlets, about 1.3 cm. high; phyllaries 2 mm. wide or less. "Hierba del venado" (Coahuila); "jarilla;" "romerillo" (Coahuila).

The plant is employed locally as a remedy for fevers, rheumatism, and affections of the stomach and intestines.

23. *Porophyllum greggii* A. Gray, Pl. Wright. 1: 120. 1852.

Coahuila; type from Parras. Texas.

Suffruticose, 20 to 30 cm. high; heads solitary at tips of branches; phyllaries elliptic or obovate-oblong; achenes 5 mm. long, not tapering above. (Description compiled.)

24. *Porophyllum crassifolium* S. Wats. Proc. Amer. Acad. 24: 57. 1889.

Porophyllum leptophyllum I. M. Johnston, Proc. Calif. Acad. IV. 12: 1210. 1924.

Porophyllum tridentatum crassifolium I. M. Johnston, Proc. Calif. Acad. IV. 12: 1211. 1924.

Baja California and islands; type from Mulejé.

Low, shrubby, much branched; leaves linear to elliptic, 5 to 20 mm. long, 0.8 to 3 mm. wide, sessile, cuspidate; heads solitary at tips of branches and branchlets, 9 to 13 mm. high; phyllaries round-tipped or obtuse, 2.5 to 4.5 mm. wide.

25. *Porophyllum tridentatum* Benth. Bot. Voy. Sulph. 30. 1844.

Baja California; type from Magdalena Bay.

Similar to *P. crassifolium*; leaves coarsely 3 or 5-toothed, the teeth usually cuspidate.

101. **CHRYSACTINIA** A. Gray, Mem. Amer. Acad. n. ser. 4: 93. 1849.

REFERENCES: Blake, Proc. Amer. Acad. 51: 524-525. 1916; Rydberg, N. Amer. Fl. 34: 180-181. 1915-16.

Low, nearly or quite glabrous shrubs; leaves opposite or alternate, entire or pinnatilobate, glandular-punctate; heads solitary, radiate, yellow or orange; involucre of 8 to 12 free linear phyllaries, each with a terminal oil gland; achenes slender; pappus of numerous bristles.

The following treatment includes all the known species.

Leaves entire.

Leaves subulate, 0.7 to 1.2 mm. wide; phyllaries 12.....1. **C. mexicana.**

Leaves filiform-subulate, 0.25 mm. wide; phyllaries 8.....2. **C. acerosa.**

Leaves pinnatilobate.

Leaf lobes 9 to 17, acute.....3. **C. pinnata.**

Leaf lobes 3 to 11, truncate.....4. **C. truncata.**

1. **Chrysactinia mexicana** A. Gray, Mem. Amer. Acad. n. ser. 4: 93. 1849.

Pectis taxifolia Greene, Leaflets 1: 148. 1905.

Chihuahua to Tamaulipas, south to Veraacruz and State of Mexico; type from Saitillo, Coahuila. Texas and New Mexico.

Undershrub, much branched, up to 60 cm. high; leaves 4.5 to 15 mm. long, spinulose-tipped, bearing numerous glands; heads golden yellow, about 2 cm. wide; involucre 4 to 5 mm. high. "Calanca" (Veracruz); "yeyepaxtle" (Puebla); "San Nicolás," "hierba de San Nicolás" (Coahuila, Durango, San Luis Potosí); "damiana," "damianita" (Chihuahua, Durango, Texas, etc.); "mariola" (Valley of Mexico); "falsa damiana," "garañona," "romerillo" (Coahuila, Hidalgo); said to be known sometimes as "guayule."

The plant is bitter and has a strong but rather agreeable odor. It is much used in domestic medicine, aphrodisiac, antispasmodic, sudorific, and diuretic properties being ascribed to it. It is used especially in the treatment of fevers and rheumatism.

2. **Chrysactinia acerosa** Blake, Proc. Amer. Acad. 51: 525. 1916.

Known only from the type locality, Sierra de Guascama, Minas de San Rafael, San Luis Potosí.

About 30 cm. high; leaves with few small glands; involucre 3.5 mm. high.

3. **Chrysactinia pinnata** S. Wats. Proc. Amer. Acad. 25: 154. 1890.

Known only from the type locality, near Monterrey, Nuevo León.

Leaves opposite, oblong in outline, 2.5 to 5 cm. long, 1.2 to 1.9 cm. wide, the lobes obliquely deltoid, acute, entire; rays whitish inside, orange outside; disk orange.

4. **Chrysactinia truncata** S. Wats. Proc. Amer. Acad. 25: 154. 1890.

Coahuila and Nuevo León; type from Sierra de la Silla, Nuevo León.

Leaves ovate or ovate-oblong in outline, 1.5 to 3 cm. long, 8 to 12 mm. wide, the lobes usually toothed; heads 2 to 3 cm. wide; rays bright yellow. "Hierba del venado" (Coahuila).

102. **PECTIS** L. Syst. Nat. ed. 10. 1221. 1759.

REFERENCES: Fernald, A systematic study of the United States and Mexican species of *Pectis*, Proc. Amer. Acad. 33: 57-86. 1897; Rydberg, N. Amer. Fl. 34: 194-216. 1916.

Herbaceous or suffruticulose; leaves opposite, glandular-punctate, usually entire, setose-ciliate; heads usually solitary, radiate, yellow; involucre of few equal phyllaries; achenes slender; pappus (in ours) of 4 to 40 bristles, or these sometimes reduced to squamellae, or (in the ray) wanting.

Involucre 4 to 6 mm. high, the phyllaries acute or acuminate; leaves mostly erect..... 1. *P. diffusa*.

Involucre usually 5 to 8 mm. high, the phyllaries rounded or obtuse, rarely acutish; leaves wide-spreading.

Phyllaries broadly oval, 3 to 5 mm. wide, with strongly overlapping margins. 2. *P. latisquama*.

Phyllaries linear to oblong, 2.5 mm. wide or less.

Leaves obovate-oblong, 4 to 10 mm. wide..... 3. *P. liebmannii*.

Leaves linear or lance-linear, 1 to 4 mm. wide.

Branches pubescent..... 4. *P. saturejaoides*.

Branches glabrous..... 5. *P. stenophylla*.

1. *Pectis diffusa* Hook. & Arn. Bot. Beechey Voy. 296. 1840.

Jalisco and Colima; type from Jalisco.

Suffruticulose, spreading or erectish, 25 cm. long or less; leaves linear, 2 to 4 cm. long, 1 to 3 mm. wide, setose-ciliate mostly below the middle; heads solitary in the upper axils, slender-peduncled, 1 to 1.5 cm. wide; involucre slender; pappus of 4 to 20 unequal bristles.

2. *Pectis latisquama* Schultz Bip.; Greenm. Proc. Amer. Acad. 39: 118. 1903.

Puebla and State of Mexico; type from Valley of Mexico.

Suffruticulose, depressed; branches puberulous; leaves linear-lanceolate, 1 to 2 cm. long; heads short-peduncled, 1.5 cm. wide; phyllaries very broad, blunt, ciliate at apex, purplish; rays yellow or purplish-tinged; pappus of ray and disk of numerous bristles.

3. *Pectis liebmannii* Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 226. 1881.

Jalisco; type from San Agustín.

Suffruticose, procumbent, 20 to 30 cm. long, canescent-tomentose or lanate; leaves 1.5 to 2.5 cm. long, with several long basal setae; peduncles very short; ray achenes epappose; disk achenes with a pappus of 20 to 30 unequal bristles. (Description compiled.)

4. *Pectis saturejaoides* (Mill.) Schultz Bip. in Seem. Bot. Voy. Herald 309. 1856, as *P. satureioides*.

Inula saturejaoides Mill. Gard. Dict. ed. 8. *Inula* no. 13. 1768.

Pectis canescens H. B. K. Nov. Gen. & Sp. 4: 263. 1820.

Lorentea auricularis DC. Prodr. 5: 102. 1836.

Pectis auricularis Schultz Bip. in Seem. Bot. Voy. Herald 309. 1856.

Pectis canescens villosior Coulter, Bot. Gaz. 20: 52. 1895.

Pectis repens T. S. Brandeg. Zoe 5: 241. 1906.

Sinaloa to San Luis Potosí, south to Chiapas; type from Veracruz. Guatemala to Nicaragua.

Suffruticulose, erectish or prostrate; leaves 1 to 2 cm. long; heads 1.5 to 2.2 cm. wide, the rays yellow or purplish-tinged; pappus very variable in the ray, of about 20 or fewer bristles (2 or 3 sometimes thickened and awnlike), or of squamellae, or wanting, in the disk of about 20 slender bristles.

5. *Pectis stenophylla* A. Gray, Proc. Amer. Acad. 21: 393. 1886.

Sonora and Chihuahua; type from Batopilas, Chihuahua.

Suffruticose below, diffusely branched; leaves 3 to 4 cm. long, 1 to 2 mm. wide, bristly toward base; peduncles filiform, 3 to 6 cm. long; pappus of ray achenes of 2 slender bristles, of the disk achenes of 20 to 40 slender, unequal bristles.

103. *ARTEMISIA* L. Sp. Pl. 845. 1753.

REFERENCE: RYDBERG, N. Amer. Fl. 34: 244-285. 1916.

Herbs or shrubs, usually bitter-aromatic; leaves alternate; heads small, panicle (in ours), nodding, discoid or disciform, the marginal flowers sometimes pistillate; involucre of few-seriate, more or less scarious-margined phyllaries; receptacle glabrous or pubescent; achenes small, thickish; pappus wanting or rarely a low squamellaceous crown.

Leaves narrowly cuneate, 3-toothed at apex.....1. *A. tridentata*.
Leaves entire and filiform, or pinnately parted into filiform lobes.

Heads minute, 1 to 1.5 mm. wide; involucre densely canescent-tomentose.

2. *A. filifolia*.

Heads larger, 3 to 4 mm. wide; involucre not canescent-tomentose.

3. *A. californica*.1. *Artemisia tridentata* Nutt. Trans. Amer. Phil. Soc. n. ser. 7: 398. 1841.

Baja California. Western United States; type from the Columbia River.

Shrub up to 5 meters high, densely silky-pubescent, very leafy; leaves sessile, 1 to 3 cm. long, 2 to 5 mm. wide; heads 3 to 4 mm. high, in dense leafy panicles; pappus none.

In some parts of the United States this species is abundant, and is known as sagebrush. It has a bitter flavor and a characteristic odor. The Coahuilla Indians of California ground the seeds into a meal which was made into pinole. The plant is used for various purposes in domestic medicine.

2. *Artemisia filifolia* Torr. Ann. Lyc. N. Y. 2: 211. 1828.

Chihuahua. Nebraska and Wyoming to Texas and Nevada; type locality not stated.

Shrub up to 1 meter high, very leafy, cinereous-puberulous; leaves filiform or 3-parted into filiform lobes, 1.5 to 8 cm. long, about 0.2 mm. wide; heads yellow, in long dense leafy panicles; pappus none. "Estafiate," "istafiate."

A decoction of the leaves is employed in domestic medicine as a remedy for intestinal worms and affections of the stomach.

3. *Artemisia californica* Less. Linnaea 6: 523. 1831.

Artemisia fischeriana Besser, Nouv. Mém. Soc. Nat. Moscou 3: 21. 1834.

Artemisia abrotanoides Nutt. Trans. Amer. Phil. Soc. n. ser. 7: 399. 1841.

Crossostephium californicum Rydb. N. Amer. Fl. 34: 243. 1916.

Northern Baja California and Guadalupe Island (according to Brandegee and H. M. Hall). California; type from California.

Shrub 1 to 3 meters high, canescent-strigillose, sometimes greenish; leaves about 4.5 cm. long, pinnately divided into few filiform lobes, or the upper entire; heads in long narrow leafy panicles; pappus a minute squamellate crown.

104. *LIABUM* Adans. Fam. Pl. 2: 131. 1763.REFERENCE: Greenman, Key to the Mexican species of *Liabum*, Proc. Amer. Acad. 32: 293-294. 1897.

Shrubs or herbs; leaves opposite, rarely ternate, usually ovate, petioled, and canescent-tomentose beneath; heads radiate or discoid, yellow, usually small and panicle; involucre graduate, usually about 4-seriate; receptacle sometimes bristly; achenes short, subterete; pappus usually of an inner series of slender bristles and a short outer series of squamellae, or the latter wanting.

Heads discoid.

Phyllaries obtuse.

Leaves green and glabrous beneath.....1. *L. glabrum*.

Leaves white-tomentose beneath.....1a. *L. glabrum hypoleucum*.

Phyllaries acute or acuminate.

Involucre 1.2 to 1.8 cm. high.

Petioles about 4 mm. long; involucre about 7-seriate-----5. *L. pringlei*.

Petioles about 2 cm. long; involucre about 4-seriate-----6. *L. klattii*.

Involucre much shorter.

Phyllaries silky-pubescent-----2. *L. sericolepis*.

Phyllaries not silky-pubescent.

Phyllaries glandular-hispidulous; pedicels stipitate-glandular.

3. *L. adenotrichum*.

Phyllaries not glandular-hispidulous; pedicels not stipitate-glandular.

4. *L. caducifolium*

Heads radiate.

Heads few, large, the involucre 2 to 4 cm. thick-----7. *L. andrieuxii*.

Heads numerous, much smaller, the involucre less than 1 cm. thick.

Phyllaries attenuate; petioles wing-margined throughout--8. *L. bourgeaui*.

Phyllaries obtuse; petioles margined only at apex if at all.

Achenes densely hispidulous.

Involucre about 6 mm. high-----9. *L. andromachioides*.

Involucre about 11 mm. high-----10. *L. deppeanum*.

Achenes glabrous or hispidulous only at apex.

Involucre about 4-seriate; pedicels 1 to 1.5 cm. long--11. *L. discolor*.

Involucre 2-seriate; pedicels 2.5 to 5 cm. long-----12. *L. platylepis*.

1. *Liabum glabrum* Hemsl. Biol. Centr. Amer. Bot. 2: 232. 1881.

Known only from the vicinity of the type locality, Iturbide, near Cuernavaca, Morelos.

Shrub, up to 6.5 meters high; branches glabrous or early glabrate; leaves slender-petioled, the blades rhombic-ovate or lance-ovate, 9 to 15 cm. long, 3 to 4 cm. wide, acuminate, serrulate, cuneate at base, green above, thinly arachnoid and quickly glabrate beneath; heads numerous, thyrsoïd-panicled; involucre about 8 mm. high; achenes sparsely glandular.

1a. *Liabum glabrum hypoleucum* Greenm. Proc. Amer. Acad. 32: 294. 1897.

Jalisco and Morelos; Oaxaca (?); type from Guadaluajara, Jalisco. Guatemala and El Salvador.

Leaves permanently arachnoid-tomentose beneath; achenes often glabrous. "Palo de agua" (Oaxaca); "espinillo," "palo de San Nicolás," "papelillo" (El Salvador).

2. *Liabum sericolepis* Hemsl. Biol. Centr. Amer. Bot. 2: 232. 1881.

Known only from the type locality, Valley of Córdoba, Veracruz.

Shrub, scandent (?); branches glabrescent; leaf blades ovate-oblong, 5 to 7.5 cm. long, green above, white-tomentose beneath; heads numerous, densely cymose-panicled; involucre 4 or 5-seriate; immature achenes setulose at apex. (Description compiled.)

3. *Liabum adenotrichum* Greenm. Field Mus. Bot. 2: 439. 1912.

Known only from the type locality, Cerro de Frujano, Distrito del Centro Oaxaca.

Shrub, 3 to 4 meters high; branches floccose-tomentose, glabrate; leaf blades ovate, 6 to 13 cm. long, 2 to 7.5 cm. wide, acuminate, cuneate at base, above arachnoid-tomentose, glabrate, beneath densely white-lanate; inner phyllaries acute or obtuse, the outer acute; achenes hirsute and glandular. (Description compiled.)

4. *Liabum caducifolium* Robins. & Bartlett, Proc. Amer. Acad. 43: 59. 1907.

Known only from the type locality, near Acapulco, Guerrero.

Shrub, leafless at flowering time (the leaves unknown); branches glabrate; heads numerous, cymose-panicled, short-pedicled; involucre 5 mm. high; immature achenes hispidulous; pappus fulvescent.

5. *Liabum pringlei* Robins. & Greenm. Proc. Amer. Acad. 32: 49. 1896.

Known only from the type locality, mountains near Lake Chapala, Jalisco.

Suffrutescent, about 1 meter high; stems fuscous-tomentulose; leaf blades ovate, 4 to 7.5 cm. long, 2 to 4.2 cm. wide, green above, canescent-tomentose beneath; heads about 6, about 3 cm. wide; phyllaries lanceolate, acuminate, brownish-pubescent, closely imbricate; achenes sericeous.

6. *Liabum klattii* Robins. & Greenm. Amer. Journ. Sci. III. 50: 156. 1895.

Veracruz and Oaxaca; type from Monte Alban, near City of Oaxaca.

Shrub, up to 6.5 meters high, leafless at flowering time; branches arachnoid, glabrate; leaf blades deltoid-ovate, about 12.5 cm. long and wide, acuminate, cuneate at base, glabrous above, arachnoid beneath; heads rather numerous, in short thyrsoid panicles; phyllaries acuminate; achenes densely pubescent.

7. *Liabum andrieuxii* (DC.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 231. 1881.

Vernonia andrieuxii DC. Prodr. 5: 16. 1836.

Oaxaca and Chiapas; type collected between Tehuantepec and the Río Coatzacoalcos.

Shrub; branches sordidly tomentose and hispid-glandular; leaf blades deltoid-ovate, 8 to 16 cm. long and wide, acuminate, cuneate at base, repand-dentate and often somewhat hastate-lobed near base, green above, canescent-tomentose beneath; heads about 3 at tips of branches; phyllaries attenuate, tomentose, squarrose; achenes densely pubescent; pappus straw-color, varying to purplish.

8. *Liabum bourgeauii* Hieron. Verh. Bot. Ver. Brand. 48: 208. 1906.

Liabum asclepiadeum Hemsl. Biol. Centr. Amer. Bot. 2: 231. 1881. Not *L. asclepiadeum* Schultz Bip. 1847.

Veracruz and Chiapas; type from Valley of Córdoba, Veracruz. Guatemala to Costa Rica.

Suffrutescent (?), 2 meters high; branches angled, lanate-tomentose; leaf blades ovate to suborbicular-ovate, 6 to 23 cm. long, 2 to 14 cm. wide, acute or acuminate, cuneately decurrent the whole length of the petiole and usually auriculate-connate at its base, callous-denticulate, green above, arachnoid-tomentose beneath; heads numerous, in dense cymose panicles; involucre 6 to 8 mm. high; achenes hispidulous; pappus without outer squamellae.

9. *Liabum andromachioides* (Less.) Hemsl. Biol. Centr. Amer. Bot. 2: 231. 1881.

Vernonia andromachioides Less. Linnaea 6: 397. 1831.

Sinclairia andromachioides Schultz Bip.; Hemsl. Biol. Centr. Bot. 2: 231. 1881, as synonym.

Veracruz; type from Misantla. El Salvador.

Shrubby; branches glandular-tomentulose, glabrate; leaf blades oval-ovate to suborbicular-ovate, 7 to 16 cm. long, 4.5 to 11 cm. wide, acute, rounded at base, callous-denticulate, green above, griseous-tomentose beneath; heads numerous, in large panicles; phyllaries ciliate.

10. *Liabum deppeanum* (Less.) Hemsl. Biol. Centr. Amer. Bot. 2: 232. 1881.

Andromachia deppeana Less. Linnaea 6: 401. 1831.

Veracruz; type from Cuesta Grande del Jacingo.

Shrubby; branches glabrate; leaf blades ovate, 10 to 12 cm. long, 6.5 to 8.5 cm. wide, acuminate, cuneate at base, callous-denticulate, green above, arachnoid-tomentose beneath; heads cymose-panicled.

11. *Liabum discolor* (Hook. & Arn.) Benth. & Hook.; Hemsl. Biol. Centr. Amer. Bot. 2: 232. 1881.

Sinclairia discolor Hook. & Arn. Bot. Beechey Voy. 433. 1840-41.

Oaxaca (?). Guatemala to Nicaragua; type from Realejo, Nicaragua.

Shrubby; stem arachnoid, glabrate; leaf blades ovate or suborbicular-ovate, 8 to 14 cm. long, acute or acuminate, rounded to cuneate at base, green above, canescent-tomentose beneath; heads numerous, in usually broad panicles; involucre about 8 mm. high.

12. *Liabum platylepis* Schultz Bip.; Klatt, Leopoldina 23: 146. 1887.

Known only from the type locality, Mirador, Veracruz.

Shrub, epiphytic on oaks; branches lanate; leaf blades rhombic, 12.5 cm. long, 9 cm. wide, green above, white-tomentose beneath; heads thyrsoïd-panicled. (Description compiled.)

DOUBTFUL SPECIES.

LIABUM LIEBMANNII Klatt, Leopoldina 23: 146. 1887.

Sinclairia liebmannii Schultz Bip.; Klatt, Leopoldina 23: 146. 1887, as synonym.

Known only from the type locality, Bartolo, Mexico.

Heads terminal, densely thyrsoïd-panicled; phyllaries lanceolate, green; achenes hirsute; pappus rufous. (Description compiled.)

105. *LEPIDOSPARTUM* A. Gray, Proc. Amer. Acad. 19: 50. 1883.

1. *Lepidospartum squamatum* A. Gray, Proc. Amer. Acad. 19: 50. 1883.

Linosyris squamata A. Gray, Proc. Amer. Acad. 8: 290. 1873.

Tetradymia squamata A. Gray, Proc. Amer. Acad. 9: 207. 1874.

Northern Baja California. California to Nevada and Arizona; type from California.

Rigid broomlike shrub 1 to 2 meters high; branches and obovate-spatulate entire leaves (about 1 cm. long) of young plants densely canescent-tomentose; older branches and stem practically glabrous, green, with minute, appressed, scale-like leaves 1 to 2 mm. long; heads pale yellow, 10 to 18-flowered, in long racemes or narrow panicles, discoid, 1 cm. high; involucre about 4-seriate, strongly graduate, about 5 mm. high, of ovate to oblong, appressed, scarious-margined phyllaries; achenes glabrous; pappus of abundant soft white bristles.

106. *HAPLOESTHES* A. Gray, Mem. Amer. Acad. n. ser. 4: 109. 1849.

1. *Haploesthes greggii* A. Gray, Mem. Amer. Acad. n. ser. 4: 109. 1849.

Coahuila; type from Ciénaga Grande. Oklahoma and Texas to Colorado and Arizona.

Herbaceous or suffrutescent, 60 cm. high or less, erect, rather fleshy, pale green, glabrous; leaves opposite, narrowly linear or filiform, 3 to 7 cm. long, 1 to 2 mm. wide, acute, entire, 1-nerved, connate at base; heads in small panicles, pale yellow, radiate, about 1 cm. wide; involucre 2-seriate, equal, of "4" or 5 very broadly oval or obovate-oval, blunt, many-nerved phyllaries; achenes slender, 10-ribbed, hispidulous, 2 mm. long; pappus of about 24 scabrid bristles, about as long as the achene or longer.

107. *PEUCEPHYLLUM* A. Gray in Torr. U. S. & Mex. Bound. Bot. 74. 1859.

1. *Peucephyllum schottii latisetum* I. M. Johnston, Proc. Calif. Acad. IV. 12: 1212. 1924.

Baja California and Sonora; type from San Marcos Island, Gulf of California.

Shrub up to 3 meters high, much branched, resinous-glandular on the young parts; leaves alternate, crowded, linear-filiform, about 2 cm. long, 1 mm. wide, thick, entire, obtuse, glandular-punctate; heads solitary at tips of branches, short-peduncled, discoid, dull yellow, about 1 cm. high and thick; involucre 2-seriate, equal, 8 to 10 mm. high, the phyllaries lance-linear, caudate-attenuate, herbaceous above; achenes densely silky-pilose, about 2.5 mm. long; pappus several-seriate, the outer of numerous graduate bristles, the inner of about 15 linear acuminate paleaceous awns about 5 mm. long. "Romero" (Baja California).

Used medicinally.

108. SENECIO L. Sp. Pl. 866. 1753.

(Contributed by Dr. J. M. Greenman.)

REFERENCES: Greenman, Monogr. Senecio, Part I, pp. 1-37. 1901; Bot. Jahrb. Engler **32**: 1-33. 1902; Ann. Mo. Bot. Gard. **2**: 573-676. *pl.* 17-20. 1915; op. cit. **3**: 85-194. *pl.* 3-5. 1916; op. cit. **4**: 15-36. *pl.* 4. 1917; op. cit. **5**: 37-107. *pl.* 4-6. 1918.

Herbs, suffruticose plants, shrubs, or woody, scandent or climbing perennials, or even arborescent plants; leaves alternate, very variable, pinnately or palmately veined, entire to variously divided; heads heterogamous and radiate, or discoid; involucre narrowly campanulate, usually subtended by calyculate bracteoles; bracts of the involucre uniseriate, or by overlapping subbiseriate, variable in number but tending to approach a definite series of numbers, namely 5-8-13-21, etc.; ray flowers when present disposed in a single row, fertile, the rays sometimes reduced; disk flowers perfect; corollas slenderly tubular to abruptly ampliate above into a campanulate 5-toothed limb, the teeth mostly short; anthers obtuse or slightly sagittate at the base; style branches truncate, rounded-obtuse, occasionally terminated by a penicillate tuft of hairs or by a triangular, acute or acuminate, dorsally hirtellous appendage; achenes subterete, usually ribbed, glabrous or hirtellous; pappus of numerous white slender setae.

A large genus, widely distributed, but of little economic value.

KEY TO THE SUBGENERA AND SECTIONS.

Style branches truncate, rounded-obtuse, or occasionally terminated by a penicillate tuft of hairs. (Subgenus *EUSENECIO*.)

Stems erect or ascending, not climbing.

Stems not abruptly terminated by a foreshortening of the main axis; oil tubes not richly developed in the cortex.

Leaves pinnately veined.

Stems more or less ligneous at the base; suffruticose plants.

Involucre barely calyculate.....**I. INCANI.**

Involucre distinctly calyculate.....**II. SUFFRUTICOSI.**

Shrubs or treelike plants.....**III. FRUTICOSI.**

Leaves palmately veined.....**IV. PALMATINERVII.**

Stems abruptly terminated by a foreshortening of the main axis, and bearing at the apex two to several more or less pedunculate, compound, corymbose cymes; oil tubes richly developed in the cortex.

V. TERMINALES.

Stems climbing.....**VI. STREPTOTHAMNI.**

Style branches terminated by a triangular, acute or acuminate, dorsally hispidulous appendage; stems prostrate or scandent. (Subgenus *PSEUDOGYNOXIS*.).....**VII. CONVULVOIDEI.**

KEY TO THE SPECIES.

I. INCANI.

A single species in Mexico.....**1. S. palmeri.**

II. SUFFRUTICOSI.

Inflorescence several to many-headed.

Leaves bi-tri-pinnatisect, not auriculate.

Stems conspicuously tufted-pubescent in the leaf axils; leaves 1.5 to 6 cm. broad.....**2. S. lyoni.**

Stems not conspicuously tufted-pubescent in the leaf axils; leaves 1.5 cm. or less broad.....**3. S. cedrosensis.**

Leaves lance-attenuate and entire to ovate and irregularly laciniate; upper leaves sessile and auriculate.

Leaves glabrous..... 4. *S. lemmoni*.

Leaves white-tomentose beneath..... 5. *S. alvarazensis*.

Leaves linear and entire to pinnately parted with narrow remote lateral divisions; upper leaves not auriculate.

Involucral bracts usually 21.

Heads 1 to 1.5 cm. high; bracteoles conspicuous, two-thirds as long as the involucre..... 6. *S. douglasii*.

Heads 1 to 1.2 cm. high; bracteoles inconspicuous, less than half as long as the involucre..... 7. *S. filifolius*.

Involucral bracts usually 13..... 8. *S. flaccidus*.

Leaves narrowly lanceolate, entire to sparingly dentate, never pinnately parted.

Upper leaves auriculate.

Involucral bracts 21..... 9. *S. picridis*.

Involucral bracts 13..... 10. *S. carnerensis*.

Upper leaves not auriculate..... 11. *S. stoechadiformis*.

Inflorescence few-headed; heads frequently solitary.

Stems procumbent..... 12. *S. procumbens*.

Stems erect..... 13. *S. calcarius*.

III. FRUTICOSI.

Leaves lanceolate.

Calyculate bracteoles broad, conspicuous..... 14. *S. cinerarioides*.

Calyculate bracteoles narrow, inconspicuous.

Plants more or less tomentose.

Leaves sessile or nearly so, sparingly tomentose beneath... 15. *S. argutus*.

Leaves distinctly petiolate, densely and permanently tomentose beneath.

16. *S. thomasii*.

Plants glabrous..... 17. *S. salignus*.

Leaves oblong-ovate to ovate-rotund.

Leaves cuneate at the base..... 18. *S. schaffneri*.

Leaves cordate at the base.

Involucre densely tomentose..... 19. *S. barba-johannis*.

Involucre glabrous or nearly so.

Stem and branches densely hirsute-tomentose... 20. *S. hirsuticaulis*.

Stem and branches floccose-tomentose to glabrous.

21. *S. aschenbornianus*.

IV. PALMATINERVII.

Inflorescence densely white-tomentose to glabrous, in no sense glandular.

Heads numerous, small or medium-sized, 6 to 12 mm. high.

Upper leaf surface closely and conspicuously reticulate-veined.

Involucre tomentose.

Heads radiate..... 22. *S. roldana*.

Heads discoid..... 23. *S. jaliscanus*.

Involucre glabrous.

Lower leaf surface tomentose..... 24. *S. hartwegi*.

Lower leaf surface glabrous..... 25. *S. seemannii*

Upper leaf surface not closely and conspicuously reticulate-veined.

Heads disposed in glomerules..... 26. *S. robinsonianus*.

Heads not disposed in glomerules.

Petioles not densely lanate 27. *S. albonervius*.

Petioles densely lanate.

Leaves permanently tomentose on both surfaces.

27a. *S. eriophyllus*.

Leaves tomentose beneath, glabrate above..... 28. *S. lanicaulis*.

Heads few, large, 12 to 20 mm. high.

Leaves angulate-lobed, strongly reticulate-veined.

Leaves angulately 5-lobed..... 29. *S. reticulatus*.

Leaves 7 to 13-lobed..... 30. *S. acerifolius*.

Leaves subpinnately incised, not strongly reticulate-veined.

31. *S. ehrenbergianus*.

Inflorescence more or less glandular-hirtellous, often with hirsutish hairs intermixed.

Leaves 3 to 5-lobed, somewhat halberd-shaped.

Heads ligulate..... 32. *S. anisophyllus*.

Heads discoid.

Leaves not peltate.

Basal lobes of leaf reflexed..... 33. *S. chrismarii*.

Basal lobes of leaf horizontally spreading..... 34. *S. hederæfolius*.

Leaves excentrically peltate..... 35. *S. alienus*.

Leaves 5 to 13-lobed, not halberd-shaped.

Involucre 5 to 7 mm. high.

Ray flowers conspicuous.

Leaves 5 to 12 cm. broad, 5 to 7-lobed.

Leaves sparingly tomentose beneath.

Leaves angulately 5-lobed..... 36. *S. hederoides*.

Leaves sinuately 7-lobed..... 37. *S. oaxacanus*.

Leaves densely tomentose beneath..... 38. *S. hypomalacus*.

Leaves 20 to 25 cm. broad, 7 to 13-lobed..... 39. *S. langlassei*.

Ray flowers absent..... 40. *S. cristobalensis*.

Ray flowers inconspicuous.

Upper leaves mostly dentate..... 41. *S. cordovensis*.

Upper leaves mostly entire..... 42. *S. macrobotrys*.

Involucre 8 to 12 mm. high.

Ray flowers much reduced, inconspicuous.

Bracts of the inflorescence foliaceous..... 43. *S. angulifolius*.

Bracts of the inflorescence setaceous..... 44. *S. brachyanthus*.

Ray flowers conspicuous.

Main lobes of the leaf not again angulate-lobed.

Leaves peltate..... 45. *S. chapalensis*.

Leaves not peltate.

Peduncles and involucre bracts granulose-hirtellous.

46. *S. sartorii*.

Peduncles and involucre bracts subhirsute..... 47. *S. petasitis*.

Main lobes of the leaf again angulate-lobed.

Leaf blade about as broad as long..... 48. *S. platanifolius*.

Leaf blade broader than long..... 49. *S. gilgii*.

V. TERMINALES.

Leaves pinnately veined.

Leaves ovate-oblong, rounded to cordate at the base.

Involucre 10 to 13 mm. high..... 50. *S. orcuttii*.

Involucre 4 to 7 mm. high.

Leaves thin; pubescence white-floccose..... 51. *S. chicarrensis*.

Leaves thickish; pubescence tawny..... 52. *S. grandifolius*.

Leaves lanceolate, gradually narrowed at the base.

Involucral bracts 5.

Veins not strongly reticulate..... 53. *S. uspantanensis*.

Veins strongly reticulate.

Heads radiate; stems above papillose..... 54. *S. standleyi*.

Heads discoid; stems above glabrous or ferruginous.

55. *S. cobanensis*.

Involucral bracts 8.

Stems above smooth..... 56. *S. andrieuxii*.

Stems above pubescent..... 57. *S. liebmannii*.

Leaves palmately veined.

Leaves glabrous..... 58. *S. praecox*.

Leaves arachnoid-tomentose beneath..... 59. *S. velatus*.

VI. STREPTOTHAMNI.

A single species in Mexico..... 60. *S. parasiticus*.

VII. CONVOLVULOIDEI.

Heads 1 to 1.5 cm. high; bracteoles squarrose..... 61. *S. kermesinus*.

Heads 1.5 to 2 cm. high; bracteoles appressed..... 62. *S. confusus*.

1. *Senecio palmeri* A. Gray, Proc. Amer. Acad. 11: 80. 1876.

Guadalupe Island, Baja California, whence the type.

Suffruticose, 1 meter or less high, persistently white-tomentose throughout; leaves oblong-spathulate, 3 to 9 cm. long, obtuse, entire to sinuate-dentate, narrowed at the base into a petiole; inflorescence a terminal, pedunculate, few to several-headed, corymbose cyme; heads 10 to 14 mm. high, radiate; disk flowers numerous; achenes sericeous-pubescent.

2. *Senecio lyoni* A. Gray, Syn. Fl. ed. 2. 1²: 454. 1886.

Islands off Baja California; type from San Clemente Island.

Suffruticose; stems terete below, subangulate and striate above, persistently tomentose in the leaf axils; leaves 3 to 13 cm. long, 1 to 6 cm. broad, bi-tri-pinnatisect into linear obtuse divisions, glabrous above, tomentulose to nearly or quite glabrous beneath; heads 10 to 12 mm. high, few, on long bracteate peduncles, radiate; ray flowers 10 to 12; rays yellow; disk flowers numerous; achenes canescent-pubescent.

3. *Senecio cedrosensis* Greene, Bull. Calif. Acad. 1: 194. 1885.

Cedros Island, Baja California, whence the type.

Suffruticose; stem below ligneous, covered with a grayish bark; branches sparingly crisp-hirsute with jointed hairs; leaves bi-tri-pinnatisect, 2 to 7 cm. long, 0.5 to 1.5 cm. broad, pinnately parted into short, irregularly dentate or incised divisions; heads about 1 cm. high, radiate; disk flowers exceeding the involucre; achenes canous-hirtellous.

4. *Senecio lemmoni* A. Gray, Proc. Amer. Acad. 17: 220. 1882.

Arizona and northern Baja California; type from Camp Lowell and Santa Catalina Mountains, Arizona.

Suffruticose, glabrous or nearly so; stem much branched, covered with a brownish, more or less deciduous cortex; leaves lanceolate, entire to irregularly and remotely salient-toothed, membranaceous, the lower narrowed into a petiole, the upper sessile and auriculate-amplexicaul; heads 10 to 12 mm. high, radiate; ray flowers about 12; rays yellow; disk flowers numerous, exceeding the involucre; achenes hirtellous.

5. *Senecio alvarazensis* Greenm. Field Mus. Bot. 2: 349. 1912.

Northern Mexico; type from Álvarez, San Luis Potosí.

Suffruticose; stems erect, branched, above striate and flocculent-tomentose; upper leaves sessile and auriculate-clasping, irregularly laciniate-lobed or sub-pinnate, 3 to 8 cm. long, 1 to 4.5 cm. broad, arachnoid-tomentulose above, densely and persistently white-tomentose beneath; inflorescence cymose, many-headed; heads about 1 cm. high, radiate; bracts of the involucre usually 21, lanceolate, 7 to 8 mm. long, black-tipped; ray flowers 10 to 12; rays yellow; disk flowers about 50; achenes canous-hirtellous.

6. *Senecio douglasii* DC. Prodr. 6: 429. 1837.

California to northern Baja California and Sonora; type from California.

Suffruticose, white-tomentose to nearly or quite glabrous; stems erect, more or less branched; leaves thickish, linear and entire to pinnately divided into 3 to several long, linear, acute divisions, the margins revolute; inflorescence terminating the stem and branches in a few-headed corymbose cyme; heads 1 to 1.5 cm. high, nearly as broad, radiate; involucre conspicuously calyculate; bracts of the involucre usually 21; ray flowers about 12; rays yellow; disk flowers about 60; mature achenes 4 to 5 mm. long, canescent-pubescent with upwardly appressed hairs.

7. *Senecio filifolius* Nutt. Trans. Amer. Phil. Soc. n. ser. 7: 414. 1841.

Southwestern United States, mainly east of the Rocky Mountains, to Coahuila and Chihuahua; type from "banks of the Missouri, towards the Rocky Mountains."

Suffruticose, white-tomentose to nearly glabrous; stems erect, usually branched, leafy; leaves linear and entire to pinnately divided into few to several linear divisions, the margins revolute; heads few to several, 1 to 1.5 cm. high, radiate; involucre not conspicuously calyculate, the bracteoles mostly less than half as long as the 21 bracts of the involucre; ray flowers 8 to 13; rays yellow; disk flowers 40 to 50; achenes canous-hirtellous.

8. *Senecio flaccidus* Less. Linnaea 5: 161. 1830.

Senecio regiomontanus DC. Prodr. 6: 429. 1837.

Senecio longilobus Benth. Pl. Hartw. 18. 1839.

Chihuahua to Hidalgo; type from the Llanos de Perote.

Suffruticose, more or less deciduously white-tomentose; stems 1 meter or less high; leaves 2 to 8 cm. long, flaccid, linear and entire to pinnately divided into few linear, elongate, divaricately spreading lateral divisions; heads 10 to 12 mm. high, radiate; involucre calyculate with short setaceous bracteoles; bracts of the involucre usually 13, about 6 mm. long, tomentulose to glabrous; achenes sericeous-pubescent.

9. *Senecio picridis* Schauer, Linnaea 19: 733. 1847; 20: 697. 1847.

South Mexico; type from Zimapán, Hidalgo.

Stems erect, 1 meter or less high, ligneous below, floccose-tomentose; leaves narrowly lanceolate, 3 to 13 cm. long, 5 to 10 mm. broad, acute, entire or inconspicuously denticulate, at first arachnoid-tomentulose but more or less glabrate above, permanently white-tomentose beneath, the lowermost leaves gradually narrowed into a slightly winged petiole, the upper leaves sessile and auriculate or subsagittate at the base; heads 8 to 10 mm. high, radiate; bracts of the involucre usually 21; ray flowers 8 to 10; rays yellow; disk flowers numerous; achenes sericeous-hirtellous.

10. *Senecio carnerensis* Greenm. Monogr. Senecio 1: 25. 1901; Bot. Jahrb.

Engler 32: 22. 1902; Ann. Mo. Bot. Gard. 1: 273. 1914.

Northern Mexico; type from Carneros Pass, Coahuila.

Suffruticose; leaves petiolate to sessile and auriculate, oblanceolate to spatulate, 1.5 to 5 cm. long, 1 cm. or less broad, subentire to acutely dentate, white-tomentose on both surfaces in the early stages, more or less glabrate above; heads 8 to 10 mm. high, radiate; bracts of the involucre usually 13; ray flowers about 8; rays yellow; disk flowers 30 to 40; achenes sericeous-hirtellous.

11. *Senecio stoechadiformis* DC. Prodr. 6: 429. 1837.

South Mexico; type from Villalpando.

Suffruticose, canescent-lanate throughout; stem erect, usually branched; leaves lanceolate to linear, 3 to 13 cm. long, 2 to 10 mm. broad, attenuate at both ends, acute at the apex, entire or remotely denticulate, floccose-tomentulose above in the early stages but somewhat glabrate, persistently white-tomentose beneath; margins commonly revolute; heads 8 to 12 mm. high, radiate; bracts of the involucre usually numerous; achenes canous-hirtellous.

12. *Senecio procumbens* H. B. K. Nov. Gen. & Sp. 4: 177. 1820.

Senecio helleri Klatt, Abh. Naturf. Ges. Halle 15: 333. 1882.

South Mexico at high altitudes; type from the mountains near Toluca.

A low suffruticose alpine plant, white-tomentose throughout; stems prostrate or ascending, 5 to 20 cm. high, leafy; leaves oblanceolate or somewhat spatulate, 1.5 to 5 cm. long, 0.5 to 1 cm. broad, entire to sinuate-dentate, white-tomentose on both surfaces, occasionally somewhat glabrate above; heads 1 to 1.5 cm. high, few or solitary, radiate; disk flowers numerous; achenes glabrous.

13. *Senecio calcarius* H. B. K. Nov. Gen. & Sp. 4: 184. 1820.

Senecio mairetanus DC. Prodr. 6: 430. 1837.

Senecio chrysactis Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 237. 1881

South Mexico, rocky places above timber line; type collected between Mazatlán and Chilpancingo, Guerrero.

A low branched erect shrub, 1 meter or less high, white-tomentose throughout; branches leafy; leaves linear-lanceolate, 2 to 10 cm. long, 1.5 to 10 mm. broad, acute, entire, coriaceous, revolute-margined, entire, at first tomentulose, later more or less glabrous above, densely and permanently white-tomentose beneath; heads few, 1.5 to 2 cm. high, radiate; bracts of the involucre about 21, floccose-tomentose; ray flowers usually 13; rays bright yellow; disk flowers numerous; achenes glabrous.

14. *Senecio cinerarioides* H. B. K. Nov. Gen. & Sp. 4: 183. 1820.

South Mexico; type from Morán.

Fruticose, 1 to 2.5 meters high; stem below smooth and glabrous, above angled, striate and, as well as the branches, tomentulose; leaves sessile, narrowly lanceolate, 5 to 18 cm. long, 0.5 to 1.5 cm. broad, acute, entire or denticulate, tomentulose above in the younger stages, later glabrate, persistently white-tomentose beneath, the upper leaves usually auriculate-sagittate at the base; inflorescence many-headed; involucral bracts usually 21, the calyculate bracteoles lanceolate, conspicuous, subsquarrose; ray flowers about 13; rays yellow; disk flowers numerous; achenes sparingly hirtellous or glabrous.

15. *Senecio argutus* H. B. K. Nov. Gen. & Sp. 4: 183. 1820.

South Mexico; type from Cofre de Perote.

Suffruticose; upper part of stem and branches striate; leaves tomentulose on both surfaces, somewhat glabrate above; heads many, 10 to 13 mm. high, radiate; involucre of about 13 bracts; ray flowers commonly 8; rays pale yellow; disk flowers numerous; achenes hirtellous.

16. *Senecio thomasii* Klatt, Abh. Naturf. Ges. Halle 15: 332. 1881; Leopoldina 24: 126. 1888.

Senecio lindenii Schultz Bip.; Klatt, Abh. Naturf. Ges. Halle 15: 332. 1881.

Senecio deppeanus Hemsl. Biol. Centr. Amer. Bot. 2: 239. 1881.

South Mexico; type from Orizaba; type of *S. deppeanus* from Malpais de Naulingo.

Fruticose, 1 to 2 meters high; stem erect, striate, at first tomentose, somewhat glabrate; leaves petiolate, lanceolate, 5 to 18 cm. long, 1 to 5 cm. broad, acuminate, acute, entire or denticulate, floccose-tomentulose above in the younger stages but glabrate, densely and permanently white-tomentose beneath; inflorescence many-headed; heads about 8 mm. high, radiate; ray flowers usually 8; rays yellow; disk flowers 20 to 25; achenes puberulent.

17. *Senecio salignus* DC. Prodr. 6: 430. 1837.

Cineraria salicifolia H. B. K. Nov. Gen. & Sp. 4: 188. 1820.

Senecio vernus DC. Prodr. 6: 430. 1837.

Cineraria verna Mairet; DC. Prodr. 6: 430. 1837.

Senecio axillaris Klatt, Abh. Naturf. Ges. Halle 15: 333. 1881.

Southern Arizona through Mexico to Guatemala; type collected between Cerro Ventoso and Morán.

Shrub, 1 to 2 meters high, glabrous throughout; stem branched, terete, covered with a brownish cortex; leaves sessile, narrowly lanceolate, 3 to 12 cm. long, 0.5 to 1.5 cm. broad, entire or denticulate; inflorescence a terminal paniculate cyme; heads many, 8 to 10 mm. high, radiate; involueral bracts usually 8, stramineous, shorter than the disk flowers; ray flowers commonly 5; rays bright yellow; achenes hirtellous-pubescent. "Jarilla" (Valley of Mexico); "jaral amarillo" (Valley of Mexico); "chilca" (Chiapas); "flor de dolores" (Guatemala).

A decoction of the leaves is employed locally as a remedy for intermittent fevers, and in the form of fomentations to reduce the pain of rheumatism and similar affections.

18. *Senecio schaffneri* Schultz Bip.; Klatt, Leopoldina 24: 126. 1888.

Senecio grandifolius var. *glabrior* Hemsl. Biol. Centr. Amer. Bot. 2: 240. 1881, in part.

South Mexico; type from Mirador, Veracruz.

Shrub 1 to 4 meters high; stem below covered with a grayish bark, above, as well as the branches in the younger stages, somewhat striate and arachnoid-tomentose but soon glabrate; leaves petiolate, oblong-lanceolate to ovate, 5 to 15 cm. long, 2 to 12 cm. broad, sinuate-angulate-lobed, cuneate at the base, conspicuously reticulate-veined, glabrous above, pubescent beneath especially on the midrib and lateral nerves; petioles 2 to 7 cm. long, naked; heads many, 10 to 12 mm. high, radiate; bracts of the involucre usually 5; ray flowers mostly 3; rays yellow; disk flowers about 6; achenes glabrous.

19. *Senecio barba-johannis* DC. Prodr. 6: 430. 1837.

Senecio grahami Benth. Pl. Hartw. 18. 1839.

Senecio pullus Klatt, Abh. Naturf. Ges. Halle 15: 333. 1882. Not *S. pullus* Klatt, Bull. Herb. Boiss. 4: 469. 1896.

South Mexico.

Shrub 2 to 3 meters high; stem below covered with a grayish brown cortex, branched, and densely tomentose in the younger parts; leaves petiolate, ovate to oblong-ovate, 5 to 15 cm. long, 3 to 9 cm. broad, mucronate-acute, callous-denticulate and more or less sinuate, rather thick in texture, at first tomentulose above but soon becoming glabrous and smooth except on the midvein and lateral nerves, densely and persistently tomentose beneath, cordate at the base; petioles 2.5 to 8 cm. long, densely tomentose; heads many, about 1 cm. high, radiate; involucre tomentose; ray flowers usually 5; disk flowers 10 to 15; achenes glabrous. "Barba de Juan de Dios" (Valley of Mexico); "gordolobo" (Hidalgo).

Villada reports that the sap of the thick stems is sometimes resorted to by travelers as a substitute for drinking water.

20. *Senecio hirsuticaulis* Greenm. Monogr. Senecio 1: 26. 1901; Bot. Jahrb. Engler. 32: 22. 1902; Field Mus. Bot. 2: 280. 1907.

East central Mexico; type collected between San Luis Potosí and Tampico.

Shrub; stem above and the branches, as well as the petioles, densely hirsute-pubescent with spreading hairs; leaves petiolate, ovate-oblong to ovate-rotund, 5 to 12 cm. long, 3 to 9 cm. broad, acute at the apex, subangulately 5 to 7-lobed, usually subcordate at the base, slightly hirtellous above especially on the midrib and lateral nerves, densely and permanently tomentose beneath; heads about 1 cm. high, radiate; bracts of the involucre usually 13, glabrous; ray flowers mostly 8; disk flowers 20 to 25; achenes glabrous.

21. *Senecio aschenbornianus* Schauer, Linnaea 20: 698. 1847.

South Mexico; type from the Valley of Toluca.

Shrub 1 to nearly 3 meters high; stem below covered with a brownish bark, the younger parts and the branches floccose-tomentulose but soon glabrate; leaves petiolate, broadly oblong-ovate to ovate-rotund, 5 to 12 cm. long, 3.5 to 10 cm. broad, shallowly and subangulately 5 to 9-lobed, acute at the apex, mucronate-denticulate, short-cordate to rounded at the base, at first tomentulose above but soon glabrate, densely and persistently lanate-tomentose beneath; heads about 8 mm. high, radiate; bracts of the involucre commonly 8, glabrous; ray flowers 6 to 8; rays yellow; disk flowers about 12; achenes glabrous.

22. *Senecio roldana* DC. Prodr. 6: 431. 1837.

Roldana lobata Llav. & Lex. Nov. Veg. Descr. 2: 13. 1825.

Senecio sublobatus DC. Prodr. 6: 310. 1837, nomen nudum.

Cineraria angulata Alamán; DC. Prodr. 6: 431. 1837.

Cineraria lobata Mairet; DC. Prodr. 6: 431. 1837.

Senecio schumannianus Schauer, Linnaea 20: 698. 1847.

South Mexico.

An erect branched shrub, 2 to 3 meters high, white-tomentose in the younger parts; leaves petiolate, subpalmately nerved, subrotund to oblong-ovate, 5 to 22 cm. long, nearly or quite as broad, sinuate-angulate-lobed, obtuse or acute, callous-denticulate, at first lightly floccose but soon glabrate above, densely and persistently lanate-tomentose beneath; petioles 0.5 to 13 cm. long; heads many, radiate; ray flowers usually 5; rays yellow; disk flowers 10 to 12; achenes glabrous.

23. *Senecio jaliscanus* S. Wats. Proc. Amer. Acad. 26: 143. 1891.

Southwestern Mexico; type from Chapala Mountains, near Guadalajara, Jalisco.

Stem 2 to 3 meters high, ligneous below, striate and woolly-tomentose above; leaves petiolate, oblong-ovate, 5 to 20 cm. long, nearly or quite as broad, 5 to 7-angulate-lobed, cordate, subpalmately nerved, at first arachnoid-tomentulose above but soon glabrate, permanently white-tomentose beneath; petioles 1 to 15 cm. long; heads about 12 mm. high, discoid, 15 to 20-flowered; achenes glabrous.

24. *Senecio hartwegi* Benth. Pl. Hartw. 18. 1839.

West-central Mexico; type from Bolaños, Jalisco.

Stem fruticose; branches, petioles, and lower leaf surface tomentose; leaves petiolate, suborbicular, 3 to 9 cm. long, nearly or quite as broad, repand-angulate, cordate, palmately 7 to 9-nerved, glabrous and strongly reticulate-nerved on the upper surface; heads small, radiate; achenes puberulent.

25. *Senecio seemannii* Schultz Bip. in Seem. Bot. Voy. Herald 311. 1856.

Southern Arizona and northern Mexico; type from the Sierra Madre, northwestern Mexico.

Stem erect, 1 to 2 meters high, ligneous at the base, angulate-channeled and more or less purplish-lineolate above, glabrous; leaves petiolate, orbicular-ovate, 4 to 24 cm. long, nearly or quite as broad, repand-angulate-lobed, callous-

denticulate, shallowly cordate to subtruncate at the base, glabrous on both surfaces or occasionally slightly flocculent-tomentulose beneath in the early stages but soon glabrate; heads small, radiate; achenes hirtellous or glabrous.

26. *Senecio robinsonianus* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; *Trees & Shrubs* 1: 19. *pl.* 10. 1902.

Shrub 2 to 3 meters high; stems terete, covered with a white, densely matted tomentum; leaves petiolate, ovate-rotund, 15 to 20 cm. long, nearly or quite as broad, palmately 7 to 9-nerved from just above the truncate or shallowly cordate base, denticulate to sinuately sublobate, hirtellous-pubescent above, densely and persistently lanate-tomentose beneath; inflorescence a terminal panicle; heads radiate, disposed in glomerules; achenes glabrous.

27. *Senecio albonervius* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; *Ann. Mo. Bot. Gard.* 1: 275. 1914.

South Mexico; type from the Valley of Tamascaltepec.

Arborescent, 2 to 4 meters high; stem at first white-tomentose, later glabrate; leaves petiolate, broad-ovate, 3 to 5 cm. long, nearly or quite as broad, sinuately 4 to 11-lobed, remotely callous-denticulate, cordate at the base, at first tomentulose on both surfaces, more or less glabrate above except on the midrib and nerves; petiole 3 to 10 cm. long; inflorescence a terminal many-headed panicle; heads radiate; achenes glabrous.

27a. *Senecio eriophyllus* Greenm. *Field Mus. Bot.* 2: 282. 1907.

South Mexico; type from hills near Tula, Oaxaca.

Shrub; stem in the dried state of a dark gray or blackish wood, covered with a light gray cortex; ultimate branches white floccose-tomentose in the early stages, glabrate; leaves petiolate, ovate to ovate-oblong, 6 to 10 cm. long, 5 to 8 cm. broad, sinuate-angulate-lobed, rounded to cordate at base, densely and persistently white-tomentose on both surfaces; inflorescence a terminal panicle; heads about 12 mm. high, discoid, 10 to 12-flowered; involucrel bracts 8, stramineous, floccose-tomentulose at the base, glabrous toward the apex; achenes glabrous.

28. *Senecio lanicaulis* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; *Field Mus. Bot.* 2: 283. 1907.

South Mexico; type from Pinabete, Chiapas.

Shrub; stem above densely lanate-tomentose; leaves petiolate, subrotund to reniform, cordate, palmately 7 to 9-nerved, 7 to 25 cm. broad, shallowly sinuate-lobed, unequally mucronate-dentate, at first tomentulose but soon glabrate above, densely and permanently white-lanate-tomentose beneath; inflorescence terminal, many-headed; heads radiate; ray flowers 6 to 8; disk flowers 12 to 20; achenes glabrous.

29. *Senecio reticulatus* DC. *Prodr.* 6: 431. 1837.

Senecio dictyophyllus Benth. *Pl. Hartw.* 43. 1840.

South Mexico; type from Villalpando, Michoacán.

Stems erect, 30 to 60 cm. high, from a ligneous base, glabrous; leaves short-petiolate, orbicular-ovate, 3 to 6 cm. long, nearly or quite as broad, shallowly 7 to 13-angulate-lobed, glabrous on both surfaces, paler beneath, strongly reticulate-nerved, callous-denticulate, subtruncate to slightly cordate at the base; inflorescence a terminal, somewhat leafy, few-headed, subcorymbose cyme; heads 1 to 1.5 cm. high, radiate; ray flowers 6 to 8; rays bright yellow; disk flowers numerous; achenes glabrous.

30. *Senecio acerifolius* Hemsl. *Biol. Centr. Amer. Bot.* 2: 235. 1881.

South Mexico; type from Oaxaca.

Base of stem unknown but probably ligneous; upper portion of plant glabrous; leaves petiolate, subrotund, acutely 5-angulate-lobed, 4 to 7 cm. long and broad; inflorescence few-headed; heads 12 to 16 mm. high, radiate; disk flowers 30 to 40; achenes glabrous.

31. *Senecio ehrenbergianus* Klatt, Leopoldina 24: 125. 1881.

South Mexico; type from Puebla.

Stem scandent, densely lanate-tomentose at the ligneous base, herbaceous and glabrous or slightly pubescent above; leaves petiolate, lanceolate to ovate in general outline, 4 to 12 cm. long, 1.5 to 10 cm. broad, more or less incise-lobed, cuneate to subcordate at the base, sparingly pubescent on both surfaces, paler beneath; heads few, large, 1.2 to 2 cm. high, radiate; disk flowers numerous; achenes glabrous.

32. *Senecio anisophyllus* Klatt, Leopoldina 24: 124. 1888.

Senecio hederacfolius Buchinger & Schultz Bip., not Hemsl.; Klatt, Leopoldina 23: 124. 1888.

South Mexico; type from Pelado.

Shrubby; stem terete, glabrous, branched; lower leaves petiolate, cordate, trilobate, 7-nerved, the upper leaves sessile, lanceolate, acute; heads radiate, comparatively few, disposed in a subcorymbose cyme; ray flowers about 6; disk flowers 25 to 30; achenes glabrous.

33. *Senecio chrismarii* Greenm. Monogr. Senecio 1: 26. 1901; Bot. Jahrb.

Engler 32: 22. 1902; Ann. Mo. Bot. Gard. 1: 278. 1914.

South Mexico.

Shrub; stem at first sparingly pubescent, later becoming glabrous; leaves petiolate, palmately nerved, triangular-ovate in general outline, 7 to 10 cm. long, 5 to 8 cm. broad, hastate or somewhat halberd-shaped, 3 to 5-lobed, mucronate-denticulate, deeply cordate, above sparingly hirtellous, beneath glabrous or sparsely puberulent on the nerves; petioles slender, 4 to 9 cm. long; inflorescence a terminal, loose, few-headed, densely glandular-puberulent panicle; heads 1.2 to 1.5 cm. high, discoid; disk flowers about 20; achenes glabrous.

34. *Senecio hederacfolius* Hemsl. Biol. Centr. Amer. Bot. 2: 241. 1881.

South Mexico.

Base of plant unknown; stem above and the inflorescence glandular-puberulent; leaves petiolate, suborbicular in general outline, 3 to 10 cm. in diameter, 3 to 5-angulate-lobed, callous-denticulate; inflorescence a terminal paniculate cyme; heads discoid, about 20-flowered; achenes glabrous.

35. *Senecio alienus* Robins. & Seat. Proc. Amer. Acad. 28: 110. 1893.

South Mexico; type collected near Pátzcuaro, Michoacán.

Stem below ligneous; leaves petiolate, excentrically peltate, triangular-ovate in general outline, 3 to 5-angulate-lobed, 5 to 10 cm. long, nearly as broad, apiculate-acute, callous-denticulate, essentially glabrous on both surfaces, paler beneath; inflorescence a terminal, somewhat leafy, minutely glandular-hirtellous panicle; heads about 12 mm. high, discoid; flowers few; achenes glabrous.

36. *Senecio hederoides* Greenm. Monogr. Senecio 1: 26. 1901; Bot. Jahrb.

Engler 32: 22. 1902; Bull. Herb. Boiss. II. 6: 868. 1906.

South Mexico; type from Reyes, Oaxaca.

Shrub; younger stems and branches tomentulose; leaves petiolate, palmately nerved, ovate-rotund, 3 to 8 cm. long, nearly or quite as broad, mostly 5-lobed, abruptly cuneate to subcordate at the base, granulose-hirtellous above, subtomentose beneath, the lobes mucronate-acute, the margins callous-dentate; heads numerous, 10 to 12 mm. high, radiate; bracts of the involucre usually 8, glandular-hirtellous; ray flowers commonly 5; rays yellow; disk flowers about 10; achenes glabrous.

37. *Senecio oaxacanus* Hemsl. Biol. Centr. Amer. Bot. 2: 244. 1881.

South Mexico; type from Oaxaca.

Shrub; leaves petiolate, membranaceous, 3 to 5-nerved from the base, suborbicular, 7 to 10 cm. long, equally broad, sinuately 7 to 9-lobed, callous-denticu-

late, hirtellous-puberulent above, subtomentose beneath; heads many, 8 to 9 mm. high, radiate; involueral bracts 8 to 9 mm. long; ray flowers 4 to 6; disk flowers 6 to 9; achenes glabrous.

38. *Senecio hypomalacus* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; Ann. Mo. Bot. Gard. 1: 278. *pl.* 10. 1914.

South Mexico; type from mountains of Telixtlaahuaca, Oaxaca.

An erect shrub; leaves petiolate, or the uppermost sessile, ovate-rotund to ovate-oblong, palmately 3 to 5-nerved, distinctly 5 to 11-lobed, densely crisp-hirtellous above, lanate-tomentose beneath, callous-denticulate, subcordate to truncate at the base; petioles 6 cm. or less long; heads many, 10 to 12 mm. high, radiate; disk flowers about 10, much longer than the involuere; achenes glabrous.

39. *Senecio langlassei* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; Field Mus. Bot. 2: 283. 1907.

South Mexico; type from the Sierra Madre, Michoacán or Guerrero.

Shrub 3 to 4 meters high; leaves petiolate, palmately nerved, ovate-rotund, 10 to 20 cm. long, equally broad, 7 to 13-lobed, granulose-hirtellous on the upper surface, white-tomentose beneath as well as on the petioles, the margins denticulate; inflorescence a terminal many-headed paniculate cyme; heads 1 cm. or less high, radiate; ray flowers 6 to 8; disk flowers 15 to 20; achenes glabrous.

40. *Senecio cristobalensis* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; Bull. Herb. Boiss. II. 6: 867. 1906.

South Mexico; type collected between San Cristóbal and Teopisca.

Shrub; stems in the younger stages purplish and glandular-hirtellous; leaves petiolate, palmately nerved, subrotund, 3 to 14 cm. long, quite as broad, 7 to 9-lobed, cordate, mucronate-denticulate, glandular-hirtellous above, paler and crisp-hirtellous beneath; inflorescence a terminal many-headed paniculate cyme; heads discoid; involueral bracts usually 8, glandular-hirtellous; disk flowers 10 to 12, much longer than the involuere; achenes glabrous.

41. *Senecio cordovensis* Hemsl. Biol. Centr. Amer. Bot. 2: 238. 1881.

South Mexico; type collected near Córdoba, Veracruz.

Stems more or less ligneous; leaves petiolate, suborbicular, peltate, 5 to 16 cm. in diameter, 9 to 11-lobed, remotely callous-denticulate, somewhat hirtellous above, tomentulose beneath; petioles 3 to 10 cm. long; inflorescence a terminal many-headed paniculate cyme; heads about 1 cm. high, radiate; ray flowers 3 to 5, inconspicuous; rays much reduced and more or less irregular; disk flowers 8 to 10; achenes glabrous.

42. *Senecio macrobotrys* Hemsl. Biol. Centr. Amer. Bot. 2: 243. 1881.

South Mexico; type from Orizaba, Veracruz.

Scandent shrub (?); stems above terete, purplish, ferruginous-puberulent; lower stem leaves petiolate, suborbicular, 10 to 30 cm. in diameter, excentrically peltate, 9 to 11-lobed, callous-denticulate, somewhat hirtellous-puberulent above, tomentulose beneath; petioles 3 to 12 cm. long; uppermost leaves sessile, oblong-ovate; inflorescence a terminal, rather leafy, many-headed, paniculate cyme; heads about 1 cm. high, subdiscoid; involueral bracts usually 8, glandular-hirtellous; ray flowers 2 to 5, the corollas reduced to short filiform tubes; disk flowers 7 to 11; achenes glabrous.

This species may prove eventually to be conspecific with *S. cordovensis*.

43. *Senecio angulifolius* DC. Prodr. 6: 431. 1837.

Senecio acerifolius K. Koch, Wochenschr. 237. 1861.

South Mexico.

Shrubby plant, 1.5 to 3 meters high; stem soft-woody; leaves petiolate, or the uppermost winged-petiolate to sessile, suborbicular, 6 to 15 cm. long, nearly or quite as broad, 5 to 7-angulate lobed, cordate at the base, not infrequently

peltate, slightly hirtellous above, more or less tomentose beneath, the margins callous-denticulate; inflorescence a terminal, somewhat leafy, glandular-hirtellous, paniculate cyme; heads 1 to 1.5 cm. high, inconspicuously radiate, or rays sometimes wanting; disk flowers about 12; achenes glabrous.

43a. *Senecio angulifolius* var. *ingens* Greenm. Ann. Mo. Bot. Gard. 1: 276. 1914.

South Mexico; type from Mount Ixtaccihuatl.

Inflorescence compact, fewer and larger-headed than in the species; heads 1.5 to 2 cm. high, 40 to 50-flowered.

44. *Senecio brachyanthus* Greenm. Monogr. Senecio 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; Ann. Mo. Bot. Gard. 1: 277. 1914.

South Mexico; type collected between Ayusinapa and Petatlán, Guerrero.

Shrub; stem terete, covered below with a brownish cortex; leaves petiolate, palmately nerved, suborbicular, about 7-lobed, peltate or cordate at the base, mucronate-denticulate, sparingly hirtellous on both surfaces, paler beneath; petioles 13 cm. or less in length, naked, or occasionally winged; heads 10 to 12 mm. high, heterogamous; involucrel bracts 8, glandular-hirtellous; ray flowers mostly 5, more or less reduced; disk flowers 8 to 10; achenes glabrous.

45. *Senecio chapalensis* S. Wats. Proc. Amer. Acad. 25: 155. 1890.

Southwest Mexico; type from Lake Chapala.

Shrub; leaves petiolate, palmately nerved, peltate, ovate-orbicular, 5 to 7-angulate-lobed, 3 to 10 cm. long, nearly or quite as broad, callous-denticulate, slightly hirtellous above, paler and tomentulose beneath; petioles slender, 3 to 12 cm. long; heads 12 to 14 mm. high, conspicuously radiate; ray flowers 5; rays whitish in the dried state; disk flowers 12 to 14; achenes striate, glabrous.

45a. *Senecio chapalensis* var. *areolatus* Greenm. Monogr. Senecio 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; Ann. Mo. Bot. Gard. 1: 278. 1914.

South Mexico; type collected in wet canyon above Cuernavaca, Morelos.

Shrub 1.5 to 2 meters high; leaves glabrous or essentially so on both surfaces, strikingly areolate beneath; rays smaller than in the type.

46. *Senecio sartorii* Schultz Bip.; Hemsl. Biol. Centr. Amer. Bot. 2: 247. 1881.

South Mexico; type from the Cordilleras of Veracruz.

Shrub; branches terete, ferruginous-pubescent; leaves petiolate, suborbicular, 5 to 20 cm. in diameter, obtusely 7 to 11-lobed, callous-denticulate, shallowly cordate, glandular-hirtellous above, tomentose beneath; petioles 10 cm. or less in length, the uppermost leaves sessile and oblong-ovate; heads 10 to 12 mm. high, radiate; involucrel bracts 8, ferruginous-puberulent; ray flowers commonly 5; rays conspicuous, distinctly 4 or 5-nerved; disk flowers 10 to 15; achenes glabrous.

47. *Senecio petasitis* (Sims) DC. Prodr. 6: 431. 1837.

Cineraria petasitis Sims in Curtis's Bot. Mag. pl. 1536. 1813.

Cineraria platanifolia Schrank, Pl. Rar. pl. 95. 1817. Not *Senecio platanifolius* Benth.

South Mexico; described originally from cultivated specimens grown in England.

Shrub; stem above and the branches subvelvety-pubescent; leaves petiolate, ovate-orbicular, 3 to 18 cm. long, nearly or quite as broad, sinuately 7 to 13-lobed, callous-denticulate, cordate to subtruncate at the base, closely and finely pubescent on the upper surface, densely subhirsute-tomentose beneath; petioles 2 to 14 cm. long, subhirsute; heads 12 to 15 mm. high, radiate; involucrel bracts usually 8, subhirsute-pubescent; ray flowers commonly 5; rays bright yellow; disk flowers about 15; achenes glabrous.

48. *Senecio platanifolius* Benth. Pl. Hartw. 43. 1840.

South Mexico; type from Chico.

Stems erect, 1 meter or less high, ligneous at the base, herbaceous and granulose-hirtellous with hirsutish hairs intermixed above; leaves orbicular, 3 to 12 cm. long and broad, cordate, 5 to 9-lobed, dentate, crisp-hirsute above, pubescent with long soft hairs on the veins beneath; petioles 3 to 15 cm. long; heads usually few, relatively large, about 1.5 cm. high, radiate; involueral bracts 13, granulose-hirtellous; ray flowers about 12; disk flowers numerous; achenes glabrous.

49. *Senecio gilgii* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 26. 1902; Field Mus. Bot. 2: 282. 1907.

South Mexico to Guatemala; type collected near Pinabete, Chiapas.

Shrub; stem and branches pubescent above with spreading tawny hairs; leaves long-petiolate, rotund to subreniform, 10 to 30 cm. broad, cordate, 7 to 9-nerved, sinuately lobed and the lobes again sublobate, mucronate-denticulate, hirtellous-pubescent on both surfaces; petioles 8 to 14 cm. long, densely pubescent; heads large, 1.5 to 1.7 cm. high, radiate; involueral bracts 13, densely hirsute-pubescent; ray flowers 8 to 10; rays yellow, conspicuous; disk flowers about 30; achenes striate, glabrous.

50. *Senecio orcuttii* Greenm. Field Mus. Bot. 2: 350. 1912.

South Mexico; type from Omealca, near Córdoba, Veracruz.

Arboreous, 2 to 3 meters high; leaves petiolate, oblong-ovate in general outline, 60 cm. or less long, 30 to 35 cm. broad, deeply pinnately parted into oblong-lanceolate lobes 4 to 8 cm. long and 1.5 to 4 cm. broad, acuminate, acute, remotely apiculate-dentate, ciliate, dark green above, paler beneath, sparingly pubescent on both surfaces to glabrous; heads numerous, 12 to 15 mm. high, radiate; involueral bracts 8, linear, 12 to 13 mm. long; ray flowers showy, yellow; disk flowers 12 to 15; achenes glabrous.

51. *Senecio chicarrensensis* Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb.

Engler 32: 22. 1902; Field Mus. Bot. 2: 285. 1907.

South Mexico; type collected near Chicarras, Chiapas.

Shrub; stem leafy and white-tomentose above; leaves long-petiolate, oblong-ovate, 12 to 27 cm. long, 10 to 18 cm. broad, sinuately and somewhat irregularly lobed, subcordate to abruptly contracted into an unequal base, glabrous above, floccose-tomentose beneath especially along the prominent midrib and lateral nerves; involueral bracts 8; ray flowers 2 or 3; rays short, 2 to 2.5 mm. long; disk flowers about 9; achenes glabrous.

52. *Senecio grandifolius* Less. Linnaea 5: 162. 1830.

Senecio ghiesbreghtii Hort. Hal.; Regel, Ind. Sem. Hort. Petrop. 36. 1860; Gartenflora 9: 230. pl. 296. 1860.

South Mexico; described from cultivated material.

Shrub, 3 to 4 meters high; stem and branches above bearing tufts of brownish tomentum in the leaf axils; leaves petiolate, oblong-ovate, 15 to 40 cm. long, 5 to 22 cm. broad, the lower subincised-lobed, the upper sinuate-dentate, acute, puberulent on the upper surface in the young stages but soon glabrate, crisp-tomentulose with tawny hairs beneath, subcordate to rounded at the base, margins callous-denticulate; petioles 5 to 10 cm. long; heads 6 to 8 mm. high, radiate; involueral bracts 8; ray flowers commonly 5; rays yellow; disk flowers 10 to 12; achenes glabrous.

53. *Senecio uspantanensis* (Coulter) Greenm. Monogr. *Senecio* 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902; Field Mus. Bot. 2: 286. 1907.

Senecio ghiesbreghtii var. *uspantanensis* Coulter, Bot. Gaz. 20: 52. 1895 (excluding John Donnell Smith no. 1598).

South Mexico and Guatemala; type from San Miguel Uspantán, Depart. Quiché, Guatemala.

Arboreous; leaves lanceolate to elliptic-lanceolate, including the petiole 10 to 45 cm. long, 2 to 10 cm. broad, acuminate, acute, entire or remotely and inconspicuously callous-denticulate, gradually narrowed at the base into a petiole 2.5 to 12 cm. in length, glabrous on both surfaces, thickish, dark green or almost black in the dried state, somewhat paler beneath, the midrib and lateral nerves prominent on the under leaf surface but the veinlets indistinct; heads many, small, 8 to 10 mm. high; involucre bracts 5, glabrous; ray flowers 2 or 3; disk flowers 3 to 5; achenes glabrous.

54. *Senecio standleyi* Greenm., sp. nov.

Southwestern Mexico; type from Sierra Madre, Michoacán or Guerrero, alt. 2,000 meters, 18 Feb., 1899, *E. Langlassé* 895 (Gray Herb. and U. S. Nat. Herb.).

Arboreous, 4 to 5 meters high; stem above papillose-hirsute; leaves petiolate, lanceolate to oblanceolate, including the petiole 8 to 16 cm. long, 2 to 3.5 cm. broad, acuminate, acute, entire or inconspicuously callous-denticulate, gradually narrowed at the base into a slender petiole 2 to 3 cm. long, glabrous on both surfaces, strongly reticulate-veined; inflorescence many-headed; heads 8 to 10 mm. high, radiate; bracts of the involucre 5, glabrous; ray flowers 1 to 3; rays yellow; disk flowers 4 to 6; achenes glabrous.

55. *Senecio cobanensis* Coulter, Bot. Gaz. 16: 101. 1891.

South Mexico and Guatemala; type from Cobán, Depart. Alta Verapaz, Guatemala.

Shrub; stems erect, glabrous, leafy at the apex; leaves lanceolate to somewhat oblanceolate, 10 to 12.5 cm. long, 1 to 3 cm. broad, acuminate, acute, remotely callous-denticulate, glabrous on both surfaces, conspicuously reticulate-veined; heads about 1 cm. high, discoid; involucre bracts usually 5, oblong, 5 to 6 mm. long, obtuse, glabrous, thickened at the base; disk flowers about 5; achenes glabrous.

56. *Senecio andrieuxii* DC. Prodr. 6: 430. 1837.

Senecio subverticillatus DC. Prodr. 6: 430. 1837.

Cineraria verticillata Mairet; DC. Prodr. 6: 430. 1837.

South Mexico; type from Toluca.

Shrub; stem erect, glabrous; leaves petiolate, crowded at the apex of the stem, lanceolate, including the petiole 15 to 30 cm. long, 2 to 5 cm. broad, acute, entire or remotely and inconspicuously callous-denticulate, glabrous, thickish, not strongly reticulate-veined, narrowed at the base into a petiole 2 to 6 cm. in length; heads many, 8 to 10 mm. high, radiate; involucre bracts 8, glabrous; ray flowers usually 5; disk flowers 10 to 12; achenes glabrous.

57. *Senecio liebmanni* Buchinger; Klatt, Leopoldina 24: 125. 1888.

South Mexico; type from Laguna.

Shrub; stem glabrous below, densely ferruginous-tomentose toward the top; leaves petiolate, lanceolate, including the petiole 6 to 10 cm. long, 1 to 1.5 cm. broad, acute, remotely and somewhat sinuate-dentate, narrowed at the base into a short petiole 0.5 to 1 cm. in length, strongly reticulate-veined and glabrous on both surfaces; heads 8 to 10 mm. high, radiate; involucre bracts 8, glabrous; ray flowers commonly 5; disk flowers about 8; achenes glabrous.

58. *Senecio praecox* (Cav.) DC. Prodr. 6: 431. 1837.

Cineraria praecox Cav. Icon. Pl. 3: 23. pl. 244. 1794.

Central Mexico; described originally from specimens grown at the Botanical Garden of Madrid.

Shrub, or small tree, 1.5 to 5 meters high; stems soft-woody or fleshy, terete, glabrous throughout; leaves clustered at the apex of the stem, petiolate, palmately veined, ovate in general outline, 6 to 18 cm. long, two-thirds as broad, cordate, 5 to 7-angulate-lobed with acuminate lobes, entire-margined, glabrous

on both surfaces; heads radiate; ray flowers 5 or 6; rays yellow; disk flowers 15 to 18; achenes glabrous. "Palo loco" (Valley of Mexico); "palo bobo" (*Bárceña*); "tesapacle," "tezapatl," "tezcapatli" (Nahuatl).

A decoction of the leaves is used as a domestic remedy for wounds and rheumatism.

This is one of the most striking species of the entire genus. The stems are fleshy, "the wood very soft and pithy" (ex Dr. J. Gregg), and the cortical portion is permeated with resin tubes. The plant is locally known as "candelero."

59. *Senecio velatus* Greenm. Ann. Mo. Bot. Gard. 1: 280. *pl.* 13. 1914.

Southwestern Mexico; type from bluffs of barranca, near Guadalajara, Jalisco.

Shrub or small tree, similar in habit to the preceding species; stem and branches at the apex rusty-pubescent; leaves petiolate, palmately 7-nerved, ovate-rotund in general outline, about 10 cm. long and broad, 7 to 9-angulate-lobed, persistently white-arachnoid-tomentulose beneath; heads about 1.5 cm. high, radiate; involueral bracts 8, glabrous; ray flowers 3 to 5; rays yellow; disk flowers 6 or 7; achenes glabrous.

60. *Senecio parasiticus* Hemsl. Biol. Centr. Amer. Bot. 2: 244. 1881.

Cacalia parasitica Schultz Bip. Bot. Zeit. 15: 759. 1857.

South Mexico; type collected near Orizaba.

A scandent or climbing woody plant; stem glabrous; leaves short-petiolate, somewhat fleshy, lanceolate to ovate-lanceolate, including the petiole 4 to 8 cm. long, 1 to 3 cm. broad, entire, abruptly narrowed at the base into a petiole 1 cm. or less in length; inflorescence a terminal, more or less leafy, paniculate cyme; heads 10 to 12 mm. high, discoid; involueral bracts 8, glabrous; disk flowers 15 to 20; achenes glabrous.

61. *Senecio kermesinus* Hemsl. Biol. Centr. Amer. Bot. 2: 242. 1881.

Gynoxis haenkei DC. Prodr. 6: 326. 1837.

Senecio convolvuloides Greenm. Monogr. Senecio 1: 26. 1901; Bot. Jahrb. Engler 32: 22. 1902.

South Mexico; type collected by Haenke.

Stem scandent, ligneous; branches striate; leaves petiolate, ovate to ovate-lanceolate, 3 to 10 cm. long, 1 to 6 cm. broad, acuminate, acute, subtire to coarsely dentate, rounded to shallowly cordate at the base, glabrous or slightly puberulent in the young stages; inflorescence a terminal, somewhat leafy, hirtellous-puberulent, paniculate cyme; heads in anthesis 1 to 1.5 cm. high, radiate; rays deep orange-colored; involuere calyculate with setaceous, densely hirtellous, somewhat squarrose bracteoles; bracts of the involuere commonly 13, sparingly hirtellous to glabrous, 5 to 7 mm. long; disk flowers about 40; achenes glabrous.

This species is known in Chiapas under the name of "flor de niño."

62. *Senecio confusus* Britten, Journ. Bot. Brit. & For. 36: 260. 1898.

Senecio cordifolius β *neaci* DC. Prodr. 6: 326. 1837.

Gynoxis berlandieri DC. Prodr. 6: 326. 1837.

Gynoxis berlandieri α *cordifolia* DC. Prodr. 6: 326. 1837.

Gynoxis berlandieri β *cuneata* DC. Prodr. 6: 326. 1837.

Senecio berlandieri Hemsl. Biol. Centr. Amer. Bot. 2: 236. 1881.

Tamaulipas and San Luis Potosí to Chiapas; type collected near Tampico.

Stem scandent, ligneous, 1 to 6 meters long, climbing over shrubs and trees; branches striate, glabrous or essentially so; leaves petiolate, ovate to ovate-lanceolate, 3 to 10 cm. long, 1 to 4 cm. broad, acuminate, acute, entire to coarsely dentate, cuneate to subcordate, glabrous or nearly so on both surfaces; petioles 1 to 2 cm. long; inflorescence terminating the stem and branches in a somewhat leafy paniculate cyme; heads in anthesis 1.5 to 2 cm. high, radiate; involuere conspicuously calyculate with long linear appressed bracteoles; bracts of the

involucre usually 21, glabrous or slightly puberulent; ray flowers about 15, rays deep orange-colored; disk flowers numerous, 60 or more; achenes puberulent.

DOUBTFUL SPECIES.

SENECIO CHENOPODIOIDES H. B. K. Nov. Gen. & Sp. 4: 179. 1820. This species, which was based on specimens collected at Campeche, Mexico, is of doubtful status. Its relationship, however, is with *S. confusus*.

109. *GOCHNATIA* H. B. K. Nov. Gen. & Sp. 4: 19. *pl.* 309. 1820.

Shrubs; leaves alternate, entire or toothed; heads usually glomerate, discoid; involucre many-seriate, graduate, of indurate phyllaries; corollas all equally 5-lobed; achenes pubescent; pappus of numerous stiffish bristles; anthers long-caudate at base.

Leaves green and merely puberulous beneath.

Leaves entire.....1. *G. arborescens*.

Leaves serrulate.....2. *G. glomeriflora*.

Leaves canescent or griseous-tomentose beneath.

Heads about 18-flowered.....3. *G. purpusi*.

Heads 4 to 6-flowered.

Leaves grayish green on both sides, pubescent above.....4. *G. smithii*.

Leaves bright green and glabrous above (at least at maturity), canescent-tomentose beneath.

Leaves elliptic-lanceolate or elliptic, acute or acutish, 2 to 5 cm. long.

5. *G. hypoleuca*.

Leaves oval, rounded or obtuse at apex, 4.5 to 20 mm. long.

6. *G. obtusata*.

1. *Gochnatia arborescens* T. S. Brandeg. *Zoe* 5: 163. 1903.

Cape region of Baja California; type from Cañón de Santa María.

Arborescent, 3 to 4 meters high, the trunk 20 to 30 cm. thick; stem puberulous; leaf blades ovate, 3.5 to 6.5 cm. long, 2.5 to 4.5 cm. wide, short-petioled, obtuse; heads thick-cylindric, 1.8 cm. high, 13 to "20"-flowered, crowded at tips of branches; involucre about 10-seriate, graduate, 1.5 cm. high, the phyllaries stramineous, arachnoid-ciliate, otherwise glabrous.

2. *Gochnatia glomeriflora* A. Gray, Proc. Amer. Acad. 19: 57. 1883.

Perezia capitata S. Wats. Proc. Amer. Acad. 25: 156. 1890.

Jalisco and Morelos; type from Cuernavaca, Morelos.

Suffrutescent (?), about 2.5 meters high; stem glandular-puberulous; leaves subsessile, ovate to suborbicular, 5 to 11 cm. long, 2.5 to 8.8 cm. wide, acute to acuminate, cordate at base, subcoriaceous, venose-reticulate; heads 1.3 cm. high, clustered in the leaf axils, "4" or 5-flowered; phyllaries acuminate.

3. *Gochnatia purpusi* T. S. Brandeg. *Zoe* 5: 240. 1906.

Known only from the type locality, Tehuacán, Puebla.

Shrub; stem and lower leaf surface (at first also the upper) densely cinereous-tomentose; leaves subsessile, elliptic, 1.8 to 3 cm. long, 5 to 14 mm. wide, crenate-denticulate or subentire, coriaceous; heads in terminal glomerules, about 12 mm. high, about 18-flowered; involucre lanate-tomentose.

4. *Gochnatia smithii* Robins. & Greenm. Proc. Amer. Acad. 32: 50. 1896.

Oaxaca; type from Cuicatlán.

Shrubby; young branches tomentulose-puberulous; leaves petioled, the blades lanceolate or lance-oblong, about 4 cm. long, 1.2 to 1.8 cm. wide, entire, griseously tomentose-pilose beneath; heads about 13 mm. high, in dense glomerules, 6-flowered; involucre about 7 mm. high, the phyllaries mostly obtuse, ciliolate.

5. *Gochnatia hypoleuca* (DC.) A. Gray, Proc. Amer. Acad. 19: 57. 1883.

Moquinia hypoleuca DC. Prodr. 7: 23. 1838.

Coahuila and Nuevo León to Querétaro; type from Monterrey, Nuevo León, Texas.

Shrub 2 to 2.5 meters high or "small tree," the stem cinereous- or canescent-tomentose; leaves short-petioled or subsessile; heads 8 to 10 mm. high, 4 to 6-flowered, crowded toward tips of branches; involucre 5 to 6 mm. high, the phyllaries obtuse to (inner) acute or obtusely acuminate. "Chomonque" (Durango); "ocotillo."

6. *Gochnatia obtusata* Blake, Contr. U. S. Nat. Herb. 22: 652. 1924.

Puebla and Oaxaca; type from Tehuacán, Puebla.

Similar to *G. hypoleuca*; leaves smaller, obtuse or rounded; involucre longer (6 to 8 mm.), the phyllaries acute or sharply acuminate.

110. *ONOSERIS* Willd. Sp. Pl. 3: 1480, 1702. 1804.

1. *Onoseris rupestris* (Benth.) Greenm. Proc. Amer. Acad. 41: 268. 1905.

Caloseris rupestris Benth. Pl. Hartw. 88. 1841.

Rhodoseris conspicua Turcz. Bull. Soc. Nat. Moscou 24: 95. pl. 2. 1851.

Perezipsis donnell-smithii Coulter, Bot. Gaz. 20: 53. pl. 6. 1895.

Onoseris conspicua Greenm. Proc. Amer. Acad. 41: 268. 1905.

Michoacán (or Guerrero) to Oaxaca and Chiapas. Guatemala; type from Mount Chorro.

"Shrub, 4 meters high," white-tomentose throughout, the upper surface of the leaves usually and the involucre sometimes glabrate; leaves alternate, 25 to 40 cm. long (including petiole), lyrate-pinnatifid, the terminal lobe very large, deltoid, usually hastate, coarsely dentate, the 2 or 3 lower pairs of lobes much smaller, unequal, the rachis very narrowly winged; heads paniced, cylindrical-turbinate, 6 to 12-flowered, about 2.5 cm. high; involucre graduate, 2.3 to 2.5 cm. high, of linear or linear-lanceolate attenuate phyllaries; corollas crimson, all bilabiate (4 and 1); pappus 2 cm. long, of numerous brownish white bristles; anthers long-caudate at base. "Papelillo."

111. *TRIXIS* (P. Br. Civ. Nat. Hist. Jam. 312. 1756, hyponym); Crantz, Inst. Herb. 1: 329. 1766.

REFERENCE: Robinson & Greenman, Revision of the Mexican and Central American species of *Trixis*, Proc. Amer. Acad. 40: 6-14. 1904.

Shrubs, rarely herbs; leaves alternate, entire or dentate; heads cymose or paniced, yellow; involucre double, the outer phyllaries few, usually shorter, linear to ovate, herbaceous, the inner 5 to 10, equal, subherbaceous; flowers all hermaphrodite and fertile, the corollas all bilabiate, the outer lip 3-toothed, the inner 2-cleft; achenes subcylindric, papillose; pappus of numerous usually brownish bristles; anthers caudate at base.

The following names are reported for species of this genus whose identity is uncertain: "Metatera" (Hidalgo); "manzanilla" (Sinaloa); "pichaguilla," "pichaga."

Leaves decurrent.

Leaves shortly decurrent.....1. *T. decurrens*.

Leaves long-decurrent, winging the stem.

Outer phyllaries equaling or surpassing the inner.

Outer phyllaries lance-ovate or oblong-lanceolate, acuminate..2. *T. alata*.

Outer phyllaries elliptic, barely acute.....3. *T. calcicola*.

Outer phyllaries shorter than the inner.

Outer phyllaries narrow, about one-third as long as the inner.

4. *T. mexicana*.

Outer phyllaries broad, two-thirds as long as the inner.

5. *T. pterocaulis*.

Leaves not decurrent (sometimes slightly so in *T. rugulosa*, *T. megalophylla*, and *T. wrightii*).

Outer phyllaries ovate, large, usually exceeding the inner.—6. *T. longifolia*.

Outer phyllaries linear to narrowly ovate, usually much shorter than the inner. Leaves glabrous or nearly so beneath, sometimes glandular.

Leaves conspicuously glandular beneath.

Inflorescence appressed-pubescent.....16. *T. californica*.

Inflorescence spreading-villous.....17. *T. silvatica*.

Leaves not glandular beneath.

Outer phyllaries linear or lance-linear.....18. *T. radialis*.

Outer phyllaries spatulate to oval-obovate.....19. *T. wrightii*.

Leaves silky-pubescent or tomentose beneath.

Inner phyllaries 5; heads 5 to 7-flowered.....7. *T. oligantha*.

Inner phyllaries 8; heads 10 to 25-flowered.

Larger leaves narrowly lanceolate or linear-lanceolate, usually 1 cm wide or less.

Heads small, about 1.3 cm. high; leaves not revolute.

8. *T. hyposericea*.

Heads larger, 1.5 to 2 cm. high; leaves usually strongly revolute.

Leaves 6 to 12 mm. wide, silky-tomentose beneath...9. *T. pringlei*.

Leaves usually 2 to 5 mm. wide, silky-pilose beneath.

10. *T. angustifolia*.

Larger leaves lanceolate or lance-oblong, more than 1 cm. wide.

Involucre subcanescently silky-pubescent.....11. *T. haenkei*.

Involucre green.

Inflorescence conspicuously glandular.....13. *T. megalophylla*.

Inflorescence pubescent, not strongly glandular.

Leaves merely apiculate, densely tomentose beneath.

14. *T. nelsonii*.

Leaves gradually acuminate, silky-pubescent beneath.

Leaves densely silky-pilose beneath....12. *T. peninsularis*.

Leaves rather sparsely pilose beneath.....15. *T. rugulosa*.

1. *Trixis decurrens* DC. Prodr. 7: 68. 1838.

Perdicium decurrens Sessé & Moc.; DC. Prodr. 7: 68. 1838, as synonym.

Known only from the type locality, Ayacapitla, Morelos.

Stems several, sparsely branched; leaves lance-ovate, crowded, acuminate, entire; heads terminal, subsolitary; outer phyllaries 5, ovate-lanceolate, the inner 8. (Description compiled.)

2. *Trixis alata* D. Don, Trans. Linn. Soc. 16: 192. 1830.

Guerrero; type from Mexico, without definite locality.

Suffrutescent (?), densely stipitate-glandular and pilose, branched above, very leafy; leaves oblong-ovate or lance-ovate, 5 to 8 cm. long, denticulate, sessile; heads large, about 2 cm. high, crowded, leafy-bracted.

3. *Trixis calcicola* Robinson, Proc. Amer. Acad. 49: 516. 1913.

Known only from the type locality, Iguala Canyon, near Iguala, Guerrero.

Shrubby, the branches broadly winged; leaves oblong, 10 to 14.5 cm. long, 2.3 to 3 cm. wide, acuminate, denticulate, glandular and puberulous; heads crowded; outer phyllaries 1.7 cm. long, the inner 1.2 cm.

4. *Trixis mexicana* Lex. in Llave & Lex. Nov. Veg. Descr. 1: 27. 1824.

Querétaro, Michoacán, and Guerrero; type from Vallisoletum, Michoacán.

Shrubby, "scandent"; stem broadly, branches narrowly winged; leaves short-petioled, the blades lance-ovate or oblong-ovate, 4 to 14 cm. long, denticulate,

acuminate, appressed-pilose beneath; heads loosely paniced; involucre 12 mm. high, the outer phyllaries linear or lanceolate.

5. *Trixis pterocaulis* Robins. & Greenm. Proc. Amer. Acad. 40: 8. 1904.

Known only from the type locality, Manzanillo, Colima.

Much branched; leaves sessile or short-petioled, the blades oval or elliptic-oblong, 3 to 10 cm. long, denticulate, very sparsely pubescent beneath; heads loosely paniced; outer phyllaries elliptic to oval-ovate.

6. *Trixis longifolia* D. Don, Trans. Linn. Soc. 16: 191. 1830.

Perdicium longifolium Sessé & Moc.; D. Don, Trans. Linn. Soc. 16: 192. 1838, as synonym.

Trixis obvallata Hook. & Arn. Bot. Beechey Voy. 300. pl. 65. 1840.

Trixis conferta Benth. Pl. Hartw. 289. 1848.

Sonora to San Luis Potosí and Guerrero; type from Mexico, without definite locality.

Shrubby, 1 to 1.5 meters high, leafy; leaves lanceolate, 3 to 8 cm. long, acuminate, subentire or denticulate, usually conduplicate and falcate, from essentially glabrous to somewhat appressed-villous beneath; heads numerous, crowded, leafy-bracted; involucre 1.5 to 2.5 cm. high. "Hierba del golpe" (Sinaloa); "lobo buase" (Sonora); "rosilla de dos colores."

The flower heads are sometimes placed in the ears as a remedy for earache.

- 6a. *Trixis longifolia sericea* Robins. & Greenm. Proc. Amer. Acad. 40: 9. 1904.

?*Trixis involucrata* D. Don, Trans. Linn. Soc. 16: 193. 1830.

Hidalgo and Michoacán; type from Tula, Hidalgo.

Similar; leaves conduplicate, densely silky-pilose beneath.

- 6b. *Trixis longifolia platyphylla* Robins. & Greenm. Proc. Amer. Acad. 40: 9. 1904.

Guerrero; type from Acapulco.

Leaves elliptic to obovate, 5 to 10 cm. long, 1.5 to 4 cm. wide, entire or denticulate, more or less densely silky-pubescent beneath.

7. *Trixis oligantha* Robins. & Greenm. Proc. Amer. Acad. 40: 9. 1904.

Oaxaca; type from Monte Alban.

Leaves on petioles 1 cm. long or less, lance-elliptic or lanceolate, 3 to 9 cm. long, 1.5 to 2.5 cm. wide, acuminate, denticulate, subsericeously tomentose-pilose beneath; panicle broad, the heads somewhat crowded, 1.2 to 1.8 cm. high; outer phyllaries lance-elliptic or lanceolate, equaling or sometimes surpassing the inner.

8. *Trixis hyposericea* S. Wats. Proc. Amer. Acad. 25: 157. 1890.

Known only from the type locality, near Guadalajara, Jalisco.

Slender shrub; leaves short-petioled, the blades narrowly lanceolate or lance-linear, attenuate, 4 to 9.5 cm. long, 6 to 13 mm. wide, green above, silky-pilose beneath; outer phyllaries linear or lanceolate, two-thirds as long as the inner or less.

9. *Trixis pringlei* Robins. & Greenm. Proc. Amer. Acad. 40: 10. 1904.

Known only from the type locality, Tomellín Canyon, Oaxaca.

Leaves lanceolate, 3 to 7 cm. long, 6 to 12 mm. wide, acuminate, entire, silky-tomentose beneath; involucre glandular-puberulent. (Description compiled.)

10. *Trixis angustifolia* DC. Prodr. 7: 69. 1838.

Trixis rosmarinifolia Nees, Linnæa 20: 699. 1847.

Durango to Aguascalientes and San Luis Potosí; type from "Cantoue," San Luis Potosí.

Branching shrub; leaves narrowly lanceolate to narrowly linear, 3 to 8 cm. long, 2 to 5 (rarely 10) mm. wide, strongly revolute, acuminate, more or less densely appressed-silky-pilose beneath; outer phyllaries lance-linear, usually about two-thirds as long as the inner; involucre glandular-puberulous. "Arnica" (San Luis Potosí); "hierba del aire" (Durango); "Montezuma de campo" (Coahuila).

The plant is employed as a remedy for rheumatism

11. *Trixis haenkei* Schultz. Bip. in Seem. Bot. Voy. Herald. 314. 1856.

Jalisco and Puebla; type from the Sierra Madre of northwestern Mexico.

Shrub; leaves lance-oblong or lanceolate, 3 to 14 cm. long, 1 to 4.5 cm. wide, entire or denticulate, green or grayish above, silky-pilose-tomentose beneath; heads densely crowded, 1.5 to 2 cm. high.

12. *Trixis peninsularis* Blake, Contr. U. S. Nat. Herb. 22: 654. 1924.

Capé Region of Baja California; type from San José del Cabo.

Shrub; leaves short-petioled, the blades lanceolate or lance-elliptic, 4 to 8 cm. long, 8 to 20 mm. wide, acuminate, serrulate, revolute-margined, densely silky-pilose beneath; heads 1.6 to 1.8 cm. high; outer phyllaries mostly linear, two-thirds as long as the inner or less.

13. *Trixis megalophylla* Greenm. Proc. Amer. Acad. 41: 270. 1905.

Known only from the type locality, between Sochi and Tlalkinsala, Guerrero.

Shrub; branches obscurely winged; leaves oblong-ovate or oval-oblong, the larger 7.5 to 17 cm. long, 2.5 to 6 cm. wide, entire or denticulate, revolute-margined, glandular-puberulous and pilose beneath; heads 1.5 to 1.8 cm. high; outer phyllaries lanceolate or oblanceolate, about equaling or exceeding the inner.

14. *Trixis nelsonii* Greenm. Proc. Amer. Acad. 41: 270. 1905.

Known only from the type locality, between San Cristóbal and Teopisca, Chiapas.

Leaves petioled, the blades elliptic to elliptic-obovate, 3 to 7 cm. long, 1 to 3 cm. wide, rugose above, densely griseous-tomentose beneath; petioles 5 to 8 mm. long; heads about 1.5 cm. high, rather crowded; involucre glandular-pubescent, the outer phyllaries mostly oblanceolate, half or two-thirds as long as the inner.

15. *Trixis rugulosa* Robins. & Greenm. Proc. Amer. Acad. 40: 10. 1904.

Michoacán, Guanajuato, and Querétaro; type not designated.

Shrub; branches sometimes obscurely winged; leaves lanceolate, 3 to 8 cm. long, 7 to 22 mm. wide, sparingly appressed-pilose beneath; inflorescence loose; outer phyllaries two-thirds as long as the inner, or less.

16. *Trixis californica* Kellogg, Proc. Calif. Acad. 2: 182. f. 53. 1863.

Trixis suffruticosa S. Wats. Bot. Calif. 2: 459. 1880.

Trixis angustifolia latiuscula A. Gray, Syn. Fl. 1²: 410. 1884.

Sonora to Coahuila, Zacatecas, and San Luis Potosí; Baja California and islands; type from Cedros Island, Baja California. California to Texas.

Shrub about 1 meter high; leaves lanceolate or oblong-lanceolate, 2.5 to 11 cm. long, 0.5 to 3 cm. wide, acuminate, entire or denticulate, scarcely revolute-margined, green on both sides, beneath densely gland-dotted, otherwise nearly or quite glabrous; heads 1.3 to 1.8 cm. high; outer phyllaries linear or lance-linear.

17. *Trixis silvatica* Robins. & Greenm. Proc. Amer. Acad. 40: 12. 1904.

Oaxaca; type from the Río Tehuantepec.

Leaves ovate-oblong, 5 to 8 cm. long, 2 to 3 cm. wide, thin, acuminate, sharply dentate, glandular and finely pubescent beneath; heads 2 cm. long; outer phyllaries equaling or exceeding the inner. (Description compiled.)

18. *Trixis radialis* (L.) Kuntze, Rev. Gen. Pl. 1: 370. 1891.*Inula trixis* L. Amoen. Acad. 5: 406. 1759.*Perdicium radiale* L. Sp. Pl. ed. 2. 1248. 1763.*Trixis inula* Crantz, Inst. Herb. 1: 329. 1766.*Perdicium laevigatum* Berg. Act. Holm. 33: 238. pl. 7. 1772.*Perdicium havanense* H. B. K. Nov. Gen. & Sp. 4: 155. 1820.*Trixis frutescens* P. Br.; Spreng. Syst. Veg. 3: 501. 1826.*Trixis laevigata* Lag.; Spreng. Syst. Veg. 3: 501. 1826.*Trixis havanensis* Spreng. Syst. Veg. 3: 501. 1826.*Prenanthes fruticosa* Willd.; Less. Linnaea 5: 33. 1830, as synonym.*Trixis glabra* D. Don, Trans. Linn. Soc. 16: 297. 1830.*Trixis frutescens obtusifolia* Less. Syn. Gen. Comp. 414. 1832.*Trixis frutescens glabrata* Less. Syn. Gen. Comp. 414. 1832.*Trixis frutescens subglabra* Kuntze, Rev. Gen. Pl. 1: 370. 1891.

Tamaulipas and Tepic, south to Yucatán and Chiapas. Guatemala to Panama; West Indies, South America; Texas; type from Jamaica.

Much-branched shrub, the branches glabrous or somewhat pubescent; leaves usually elliptic, varying to lanceolate or oval, 3 to 10 cm. long, 1 to 3.5 cm. wide, entire or dentate, glabrous or sparsely pubescent especially on the costa beneath; heads numerous, rather crowded, 1.5 to 2 cm. high; outer phyllaries mostly linear or lance-linear, usually half or two-thirds as long as the inner. "Tokabán," "tokabal" (Yucatán); "plumilla" (Chiapas); "hierba del aire" (Veraacruz); "falsa árnica" (*Urbina*); "Juan de calle," "árnica de monte," "chucha" (Colombia); "palo de Santa María" (Panama); "diente de león" (Nicaragua); "San Pedro," "Santo Domingo," "tulán verde," "Carmen" (El Salvador).

The plant is used locally as a remedy for diabetes, sores, and venereal diseases.

19. *Trixis wrightii* Robins. & Greenm. Proc. Amer. Acad. 40: 14. 1904.

Sinaloa and Tres Mariás Islands; type from Mazatlán.

Similar to *T. radialis*; branches sometimes obscurely winged; heads 1.5 to 1.8 cm. high; outer phyllaries up to 7 mm. wide.

DOUBTFUL SPECIES.

TRIXIS PIPITZAHUAC Schaffner; Herrera, Naturaleza 3: 407. 1876, nomen nudum. This name, never published in connection with a description, probably refers to one of the well-known species of the genus. The vernacular name is given as "pipitzahoac," and the roots are said to contain a resinous substance used as a drastic.

112. *JUNGIA* L. f. Suppl. Pl. 58, 390. 1781.**1. *Jungia pringlei* Greenm. Field Mus. Bot. 2: 286. 1907.**

Michoacán; type from Uruapan.

"Shrub 3 meters high," glandular-puberulous and somewhat pilose; leaves alternate or the upper subopposite, petioled, the blades of the larger oval-ovate or orbicular-ovate, about 12 cm. long, shallowly about 7-lobed, cordate or subcordate at base, pubescent beneath like the stem and reticulate; heads numerous, in large panicles, whitish, about 1 cm. wide; involucre nearly 1-seriate, equal, about 7 mm. high; receptacle paleaceous; corollas all bilabiate, the outer lip 3-toothed, the inner bifid; achenes about 3 mm. long; pappus silvery-white, of barbellate bristles 5 mm. long.

ADDITIONS AND CORRECTIONS.

In the several years that have passed during the publication of the various parts of this volume, there have appeared descriptions of a rather large number of new species of Mexican trees and shrubs. Although it is not feasible to include these in the keys to species, it has seemed desirable to enumerate them. It has been possible to examine authentic material of a part of the new species, and in some cases such examination has resulted in their being recognized at once as synonymous with earlier published species. In the case of species described in some of the larger or more critical genera the writer has made no attempt to determine their validity, therefore it is not to be assumed that all the additional species listed here are considered valid by the writer.

There are included also in this appendix additional vernacular names gleaned from several sources. The greater part of them have been obtained in connection with the identification of extensive collections made in the States of Sinaloa and Nayarit by Sr. Jesús G. Ortega. There have been accumulated a large number of additional vernacular names as a result of recent explorations in Central America, but it has not appeared necessary to list them here, since they will be enumerated in a flora of Central America now in course of preparation.

Corrections of typographical errors have been made only in the case of a few which are not obvious. In a work of such extent some typographical errors are bound to occur, but most of them will be recognized at once as such.

The number of species of Mexican trees and shrubs recognized as valid in the present volume is approximately 5,700. There is no doubt that this number will be greatly increased by further exploration in Mexico.

CYATHEACEAE.

Page 41. Dr. Reko states that in Chinantla, Oaxaca, *Cyathea princeps* is known as "rabo de chango," "rabo de mico," "rabo de mono," and "rabo de machín."

PINACEAE.

Page 51. The Nahuatl term for pine tree is "oco-cuahuitl," which is said to signify "torch tree." The following names are reported in literature for undetermined species of *Pinus*: "Tzivireni" (Michoacán, *Ramírez*); "pizomlab" (Huastec, *Asiain*); "tziin," "tzinkiup" (tree), "tzinuapk" (resin), "poptzin" (Mixe, *Belmar*); "cueramu" (Tarascan, *León*); "ocotel" (Popocatepetl, *Gadow*).

Page 54. *Pinus pinceana*. "Pino" (Sinaloa).

Page 55. *Pinus leiophylla*. Known in Oaxaca as "pino gretabó;" on Popocatepetl as "tlacocote" (*Gadow*).

Page 56. *Pinus teocote*. The Aztec name, "xal-ocotl," signifies "sand pine;" the name "teocote," "pine of the gods." Robelo states that this name was given because of the fact that only the nobles were permitted to use the resin as incense.

Page 58. *Pinus patula*. The term for the cones is "huajolote" or "guajolote," from "quaholotl," "woody ear (of corn)." The name "ocote macho" is said to be applied to this species.

To the species of *Pinus* listed should be added the following:

Pinus muricata Don, Trans. Linn. Soc. Bot. 17: 441. 1837. A California species, represented in northern Baja California and on Cedros Island by var. *anthonyi* Lemmon (Handb. West. Amer. Coneb. 43. 1895).

Pinus radiata Don, Trans. Linn. Soc. Bot. 17: 442. 1837. A California species. Var. *binata* Lemmon (West Amer. Coneb. 42. 1895) is reported from Guadalupe Island, Baja California.

Page 59. *Abies religiosa*. This tree occurs also in Sinaloa, where it is known as "cahuita;" in Guerrero it is called "hoja petate." Sahagún states that the nobles and rich men at certain seasons of the year decorated the doors of their dwellings with fir branches. Robelo states that when the priests sacrificed themselves by piercing various parts of their bodies with maguey spines, they carefully collected the blood upon fir branches. The branches were used by the Aztecs for making brooms, and are still employed thus in some localities.

Page 63. *Cupressus benthamii*. By European botanists this is regarded as a form of *C. lusitanica* Mill. (Gard. Dict. ed. 8. *Cupressus* no. 3. 1768), or as a synonym of that species. It is probable that the Mexican tree was carried at an early date to Portugal (hence the specific name), where it has since been in cultivation. It seems necessary, therefore, to adopt Miller's misleading name for the Mexican species. In Sinaloa the tree is known as "táscate."

To the listed species of *Cupressus* should be added the following:

Cupressus forbesii Jepson, Madroño 1: 75. 1922. Northern Baja California

GNETACEAE.

Page 64. *Ephedra trifurca*. Known in Texas as "cañatilla."

The following species is to be added to those listed:

Ephedra peninsularis I. M. Johnston, Univ. Calif. Publ. Bot. 7: 437. 1922. Baja California, the type from Magdalena Island.

POACEAE.

Page 66. *Olyra latifolia*. "Carrizo verde" (Tabasco, Ramírez).

Page 68. *Lasiacis globosa*. "Carricillo" (Sinaloa).

Lasiacis ruscifolia. "Otatillo" (Sinaloa).

PHOENICACEAE.

Page 73. *Washingtonia filifera*. Said to be known in California as "palmito."

Acanthorrhiza mocinni. "Palma de abanico" (Oaxaca).

Page 75. *Brahea dulcis*. Reko reports for this species the names "izhuate," "ixhautl," and "isuate."

Page 81. *Chamaedorea lindeniana*. Reko reports that a plant, perhaps of this species, is known in Oaxaca as "cola de pescado" and "rabo de bobo."

Page 82. To the species of *Chamaedorea* are to be added the following:

Chamaedorea pringlei S. Wats. Proc. Amer. Acad. 26: 157. 1891. Type from Tamasopo Canyon, San Luis Potosí.

Chamaedorea rigida Wendl. Gard. Chron. III. 36: 246. 1904. Mexico.

ARACEAE.

Page 85. *Monstera deliciosa*. "Paaktzatz" (Mixe, *Belmar*). The adventitious roots are employed locally for making strong baskets.

Page 87. *Philodendron radiatum*. Occurring also in Sinaloa and known as "cola de faisán." Another species of *Philodendron*, perhaps *P. fenizlii*, is known in Sinaloa as "colomo."

LILIACEAE.

Page 88. *Hesperoyucca whipplei*. Known in California as "quijote."

Page 89. *Samuela carnerosana*. "Palma," "palma de San Pedro" "palma barreta" (Coahuila).

Page 91. *Yucca elata*. "Palmilla" (Chihuahua).

Page 92. *Yucca treculeana*. "Palma de San Juan," "palma ceniza" (*Endlich*).

Page 93. *Yucca australis*. "Datiles" (fruits), "palma grande" (Coahuila). The fiber is known as "ixtle de palma." The fruits are eaten raw or cooked with sugar, and pigs are said to be fond of them. The flowers also are cooked and eaten. The names "palma china," "palma de aparejo," and "palma de sudadero" reported by *Endlich* under *Yucca valida* probably pertain to *Y. australis*.

Page 94. *Yucca macrocarpa*. "Palma" (Chihuahua).

Yucca mohavensis. By the Coahuilla Indians of California the fiber of the leaves was employed for weaving and for making sandals and saddle mats. The green fruit was roasted over coals and eaten. The ripe fruit is sweet but slightly astringent, and was eaten raw.

Page 100. *Dasylyrion cedrosanum*. "Sotol" (*Zacatecas*).

SMILACACEAE.

Page 101. The Mexican and Central American species of *Smilax* have been treated recently by *Apt* (*Repert. Sp. Nov. Fedde 18: 385. 1922*).

Page 104. The following species of *Smilax* should be added to those listed:

Smilax gymnopoda *Apt*, *Repert. Sp. Nov. Fedde 18: 401. 1922*. Type from Jalapa, Veracruz.

Smilax kerberi *Apt*, *Repert. Sp. Nov. Fedde 18: 408. 1922*. Type probably from Veracruz.

AMARYLLIDACEAE.

Page 107. A descriptive account of the genus *Agave* has been published by *Berger* (*Die Agaven. Jena, 1915*). On account of conditions resulting from the war, this was received in the United States too late for the inclusion of the data in the *Trees and Shrubs of Mexico*.

The following names are reported, relating to species of *Agave* whose identification is uncertain: "Ehpuqua" (Michoacán, Tarascan); "benal" (leaf, "boe" (pulque), "itzi," "tzim" (Huastec, *Asiain*); "keihnoo," "keitz," "keitznoo" (pulque), "tzaktz" (Mixe, *Belmar*); "acamba," "aticni" (aguamiel), "orori" (Tarascan, *León*); "guada" (Otomí, *Buelna*).

Page 117. *Agave karwinskii*. *Dr. Reko* states that this species is known in Oaxaca as "espadilla," and bears the Zapotec names "bixuexe" and "tobasiche." It is cultivated commonly along hedges and produces a superior class of mescal.

Page 119. *Agave tequilana*. *Endlich* reports that this furnishes "ixtle de Tequila," "ixtle de mescal," and "jarcia." It is called also "maguey de Tequila" and "maguey mezcal."

Page 123. *Agave potatorum*. The Tarascan name "acamba" has been reported for the species.

Page 126. *Agave deserti*. "Mezcal" (California). By the Coahuilla Indians, who call the plant "amul," the fiber is used for cordage, bowstrings, and brushes.

The leaves and stalks are eaten after having been cooked for one or two days in pits in the sand. The flowers also are eaten, and are sometimes dried for use in winter.

Page 128. *Agave compluviata*. This name should be placed in synonymy under the following, the earlier name for the species:

Agave complicata Trel.; Ochoterena, Mem. Soc. Antonio Alzate 33: 100. 1913. Type from Durango.

Page 130. *Agave atrovirens*. Known also as "maguey de pulque" and "teometl."

Page 133. *Agave asperrima*. "Maguey bruto," "maguey de cerro" (*Ochoterena*); "maguey" (Zacatecas); "maguey cenizo" (Coahuila).

Page 141. *Agave striata*. "Guapilla" (Hidalgo).

Page 142. The following species of *Agave* are to be added to those listed:

Agave cernua Berger, *Agaven* 122. f. 29, 30. 1915. Believed to be a native of Mexico; described from cultivated plants.

Agave chrysoglossa I. M. Johnston, Proc. Calif. Acad. IV. 12: 998. 1924. Type from San Pedro Nolasco Island, Gulf of California.

Agave conjuncta Berger, *Agaven* 194. f. 64. 1915. Described from cultivated plants, probably of Mexican origin.

Agave cupreata Trel. & Berger; Berger, *Agaven* 197. 1915. Type from the Sierra Madre of Michoacán or Guerrero. "Maguey de mezcal."

Agave difformis Berger, *Agaven* 95. f. 18. 1915. Described from cultivated plants, perhaps of Mexican origin.

Agave erosa Berger, *Agaven* 191. 1915. Described from cultivated plants, perhaps of Mexican origin.

Agave flaccifolia Berger, *Agaven* 42. 1915. Described from cultivated plants, perhaps of Mexican origin.

Agave kirchneriana Berger, *Agaven* 252. 1915. Type from Xochipila and Zumpango, Guerrero. "Maguey delgado."

Agave noli-tangere Berger, *Agaven* 103. 1915. Described from cultivated plants, perhaps of Mexican origin.

Agave oweni I. M. Johnston, Proc. Calif. Acad. IV. 12: 999. 1924. Type from an island in Guaymas Harbor, Sonora.

Agave pampaniniana Berger, *Agaven* 193. f. 62. 1915. Described from cultivated plants, perhaps of Mexican origin.

Agave paupera Berger, *Agaven* 235. 1915. Described from cultivated plants, perhaps of Mexican origin.

Agave purpusorum Berger, *Agaven* 111. 1915. Type from Tehuacán, Puebla.

Agave schneideriana Berger, *Agaven* 256. 1915. Described from cultivated plants of Mexican origin.

Agave sleviniana I. M. Johnston, Proc. Calif. Acad. IV. 12: 1000. 1924. Type from La Paz, Baja California.

Agave vernae Berger, *Agaven* 245. f. 73. 1915. Described from cultivated plants, perhaps of Mexican origin.

DIOSCOREACEAE.

Page 144. *Dioscorea macrostachya*. In a recent monograph of the genus *Dioscorea*, *Testudinaria cocolmea* is referred definitely by Knuth (in Engl. Pflanzenreich IV. 43: 164. 1924) to synonymy under this species. The root of the plant is a large hard tuber, partly above ground, its covering consisting of a thick dark coat that is broken into numerous polygonal plates. Dr. Reko has furnished the following information with regard to the plant: "Bejuco de coraza," "cocolmecatl." The young fleshy asparagus-like shoots contain an

albuminous juice that is used in the preparation of *pozouque*, a delicious and very nutritious refreshment, made of ground chocolate, mashed soft corn, and this juice, beaten into a light foamy mass. The ground starchy matter of the enormous rhizome is used as a *barbasco*, for stupefying fish. It probably contains the same alkaloid, dioscorine, that has been found in other species.

PIPERACEAE.

Page 152. *Piper palmeri*. This has been collected also in Nayarit, where it is called "cordoncillo."

Page 154. *Piper hispidum*. "Pie de guicharo," "tripa de zopilote" (Sinaloa).
Piper leucophyllum. "Tripa de zopilote" (Sinaloa).

Page 155. *Piper jaliscanum*. "Cocolmecca" (Sinaloa).

To the list of species of *Piper* are to be added the following:

Piper abalienatum Trel. Amer. Journ. Bot. 8: 216. pl. 8, f. 1. 1921. Type from Colima.

Piper aguilanum C. DC. Ann. Cons. Jard. Genève 21: 318. 1920. *Piper albicaule* Trel. Amer. Journ. Bot. 8: 216. pl. 8, f. 2. 1921. Type from Santa Rosa, near Aguila, Michoacán or Guerrero. Both these names were based upon the same collection.

Piper albidiflorum C. DC. Ann. Cons. Jard. Genève 21: 309. 1920. Type from El Tabasal, Michoacán or Guerrero.

Piper brachypus Trel. Amer. Journ. Bot. 8: 215. pl. 6. 1921. Type from Manzanillo, Colima.

Piper botteri C. DC. Ann. Cons. Jard. Genève 21: 307. 1920. Type from Orizaba, Veracruz.

Piper consociatum C. DC. Ann. Cons. Jard. Genève 21: 317. 1920. Type from El Muleto, Michoacán or Guerrero.

Piper diguetianum Trel. Amer. Journ. Bot. 8: 215. 1921. Type from Jalisco.

Piper manzanilloanum C. DC. Ann. Cons. Jard. Genève 21: 308. 1920. *Piper palmeri manzanilloanum* C. DC.; Rose, Contr. U. S. Nat. Herb. 1: 354. 1895. Type from Manzanillo, Colima.

Piper michelianum C. DC. Ann. Cons. Jard. Genève 21: 317. 1920. *Piper mas* Trel. Amer. Journ. Bot. 8: 215. pl. 7, f. 2. 1921. Type from El Muleto, Michoacán or Guerrero.

Piper pachouanum C. DC. Ann. Cons. Jard. Genève 21: 306. 1920. Type from Pacho Forest, Veracruz.

Piper plumanum C. DC. Not. Syst. Lecomte 3: 14. 1914. Type from Sierra de Pluma, Oaxaca.

Piper pringlei C. DC. Ann. Cons. Jard. Genève 21: 312. 1920. Type from Cuernavaca, Morelos.

Piper rosei C. DC. Ann. Cons. Jard. Genève 21: 316. 1920. *Piper rosei* C. DC.; Trel. Amer. Journ. Bot. 8: 215. 1921. Type from Sierra Madre near Colomas, Sinaloa. Both species are based upon the same collections.

Piper tepicanum C. DC. Not. Syst. Lecomte 3: 44. 1914. Type from Cerro de San Juan, Tepic.

Piper udicola C. DC. Ann. Cons. Jard. Genève 21: 314. 1920. Type from Tabasco.

Piper udimontanum C. DC. Ann. Cons. Jard. Genève 21: 306. 1920. Michoacán and Morelos (type from Cuernavaca).

Piper velutinovarium C. DC. Ann. Cons. Jard. Genève 21: 314. 1920. Type from Puerto de Alvarado, Veracruz.

Page 156. *Piper chinanlense*. A synonym is *Piper rovirosae* C. DC. Ann. Cons. Jard. Genève 21: 310. 1920.

LACISTEMACEAE.

Page 156. *Lacistema myricoides* should be placed in synonymy under the following name: *Lacistema aggregatum* (Berg) Rusby, Bull. N. Y. Bot. Gard. 4: 447. 1907. *Piper aggregatum* Berg, Act. Helv. 7: 131. pl. 10. 1777. This species has been collected in Sinaloa, where it is known as "guayparín."

SALICACEAE.

Page 158. *Populus angustifolia*. The Gosiute Indians of Utah use the young shoots of this species for basket making. A kind of honey dew produced on the under side of the leaves by aphids is gathered and used in much the same way as sugar.

Populus monticola. A synonym is *Populus brandegeei* Schneider, Ill. Handb. Laubb. 1: 23. 1904. It is probably this species of which Clavigero writes (Historia de la California, 1789): "The *guaribo*, the largest tree of California, is so like the cottonwood [álamo, of Spain] that at first glance it can not be distinguished; but nevertheless it is quite different in the quality of the wood, which is very good for rafters and all kinds of construction. Unfortunately, this tree grows only in a few rugged and almost inaccessible places, like the pines in the southern part of the peninsula."

Page 159. *Populus dimorpha*. "Alamo," "chopo" (Sinaloa).

Populus arizonica. The Pima Indians of Arizona formerly ate the fresh catkins of this and related species, stripping off the flowers between the teeth.

Page. 160. The following names are reported for undetermined species of *Salix*: "Tocoy" (Huastec, Asiain); "hoo-cuy" (Zoque, Gonzales); "xitzo" (Otomí, Buelna). By some of the North American Indians willow bark was smoked like tobacco. The Chiricahua Indians are said to have obtained a yellow dye from the trees, while the Pimas employed the inner bark for making breech cloths and skirts.

Page 161. *Salix humboldtiana*. This and its synonyms should be placed in synonymy under *Salix chilensis* Mol. (Sagg. Chil. 169. 1782), the oldest name for the species.

Page 162. *Salix taxifolia*. "Jaray" (Sinaloa). The branches are used for rough brooms, and the bark as a remedy for malaria.

JUGLANDACEAE.

Page 165. *Juglans*. Buelna reports the Otomí name for walnut (nogal) as "ttzatchu." Walnut bark is said to have been employed by some of the Indians of the United States for poisoning fish.

Page 166. *Hicoria pecan*. "Napakoma" (Villada). Villada gives the Nahuatl name as "quauhcacoatl."

Page 167. After *Hicoria pecan* insert the following:

Hicoria diguetii (Dode) Standl. *Carya diguetii* Dode, Bull. Soc. Bot. France 55: 470. 1908. Described from Mexican specimens.

BETULACEAE.

Page 168. *Alnus jorullensis*. This species occurs also in Sinaloa, where it is called "alizo." At Orizaba it is said to be called "ilite verde."

Alnus arguta. "Alizo" (Sinaloa).

Page 169. *Carpinus caroliniana*. Collected also in Sinaloa.

Page 171. An elaborate monograph of the American oaks has been published recently by Trelease (Mem. Nat. Acad. Sci. 20. 1924). In this there are described and illustrated many new species from Mexico.

- Page 197. After *Quercus candicans* insert the following species:
- Quercus pilarius** Trel. Mem. Nat. Acad. Sci. 20: 44. *pl. 19.* 1924. Type from Finca San Juan de las Chicharras, Tapachula, Chiapas.
- Quercus toxicodendrifolia** Trel. Mem. Nat. Acad. Sci. 20: 48. *pl. 33.* 1924. Type from Zacualtipán, Hidalgo.
- Quercus boqueronae** Trel. Mem. Nat. Acad. Sci. 20: 48. *pl. 33.* 1924. Type from Cerro del Boquerón, Chiapas.
- Quercus radlkoferiana** Trel. Mem. Nat. Acad. Sci. 20: 49. *pl. 35.* 1924. Oaxaca and adjoining states; type from Chinantla, Oaxaca.
- Quercus porphyrogenita** Trel. Mem. Nat. Acad. Sci. 20: 51. *pl. 39.* 1924. Nuevo León, the type from Monterrey.
- Quercus substenocarpa** Trel. Mem. Nat. Acad. Sci. 20: 52. *pl. 41.* 1924. Type from Hacienda de Tamasopo.
- Quercus baldoquinae** Trel. Mem. Nat. Acad. Sci. 20: 53. *pl. 43.* 1924. Type from Cerro Baldoquín, Michoacán.
- Quercus harmsiana** Trel. Mem. Nat. Acad. Sci. 20: 54. *pl. 45.* 1924. Type from Cerro Baldoquín, Ario de Rosales, Michoacán, at 1,800 to 2,000 meters. "Encino."
- Quercus mixtecana** Trel. Mem. Nat. Acad. Sci. 20: 54. *pl. 46.* 1924. Puebla (type from Sierra de Mixteca, San Luis) and Oaxaca.
- Quercus conjungens** Trel. Mem. Nat. Acad. Sci. 20: 55. *pl. 48.* 1924. Guanajuato (type from Acámbaro) and Hidalgo.
- Quercus cancellata** Trel. Mem. Nat. Acad. Sci. 20: 55. *pl. 49.* 1924. Puebla, the type from Sierra de Mixteca.
- Quercus subspathulata** Trel. Mem. Nat. Acad. Sci. 20: 56. *pl. 52.* 1924. Type from State of Durango.
- Quercus crenatifolia** Trel. Mem. Nat. Acad. Sci. 20: 57. *pl. 52.* 1924. Type from Chiquilistlán, Jalisco.
- Quercus aurantiaca** Trel. Mem. Nat. Acad. Sci. 20: 57. *pl. 53.* 1924. Type collected between Agua Caliente de Huachara and Basagote, Chihuahua.
- Quercus rekonis** Trel. Mem. Nat. Acad. Sci. 20: 60. *pl. 57.* 1924. Type from Apango, Oaxaca.
- Quercus prinopsis** Trel. Mem. Nat. Acad. Sci. 20: 61. *pl. 58.* 1924. San Luis Potosí, the type from Pelote.
- Quercus chartacea** Trel. Mem. Nat. Acad. Sci. 20: 61. *pl. 59.* 1924. Oaxaca (type from Salomé, Cuicatlán) and Chiapas. "Encino amarillo," "chaporro (chaparro?)."
- Quercus centralis** Trel. Mem. Nat. Acad. Sci. 20: 61. *pl. 60.* 1924. Mexico (type from Contreras, Distrito Federal), and Puebla. "Encino."
- Quercus panduriformis** Trel. Mem. Nat. Acad. Sci. 20: 62. *pl. 62, 63.* 1924. Michoacán, Jalisco, and Morelos; type from El Chuen, Ario de Rosales, Michoacán. "Encino." "encino roble."
- Quercus poculifer** Trel. Mem. Nat. Acad. Sci. 20: 64. *pl. 69.* 1924. Oaxaca (type from Las Sedas) and Puebla.
- Quercus haematophlebia** Trel. Mem. Nat. Acad. Sci. 20: 66. *pl. 74.* 1924. Type from Dolores, Tepic.
- Quercus barbanthera** Trel. Mem. Nat. Acad. Sci. 20: 68. *pl. 81.* 1924. Type from Chiapas. Guatemala.
- Quercus callosa** Benth. Pl. Hartw. 91. 1842. Chiapas. Guatemala (type from Las Casillas) and Honduras.
- Quercus obscura** Trel. Mem. Nat. Acad. Sci. 20: 71. *pl. 88, 89.* 1924. Type from the Sierra Madre.
- Quercus transmontana** Trel. Mem. Nat. Acad. Sci. 20: 71. *pl. 89.* 1924. Michoacán, the type from Pátzcuaro.

- Quercus vellifera* Trel. Mem. Nat. Acad. Sci. 20: 73. pl. 90. 1924. Type from western Mexico.
- Quercus durangensis* Trel. Mem. Nat. Acad. Sci. 20: 73. pl. 91. 1924. Durango.
- Quercus diversicolor* Trel. Mem. Nat. Acad. Sci. 20: 73. pl. 92-94. 1924. Chihuahua, the type from the Sierra Madre. Arizona and New Mexico.
- Quercus rhodophlebia* Trel. Mem. Nat. Acad. Sci. 20: 74. pl. 95-97. 1924. Jalisco, Zacatecas (type from Plateado), and Michoacán.
- Quercus ariaefolia* Trel. Mem. Nat. Acad. Sci. 20: 74. pl. 97. 1924. Type from Álvarez, San Luis Potosí.
- Quercus uhdeana* Trel. Mem. Nat. Acad. Sci. 20: 75. pl. 100. 1924. Type perhaps from Real del Monte, Hidalgo.
- Quercus alvarezensis* Trel. Mem. Nat. Acad. Sci. 20: 76. pl. 104. 1924. Type from Álvarez, San Luis Potosí.
- Quercus purpusi* Trel. Mem. Nat. Acad. Sci. 10: 76. pl. 105. 1924. Type from Salto de Agua, Mexico; Michoacán (?).
- Quercus conglomerata* Trel. Mem. Nat. Acad. Sci. 20: 77. pl. 106. 1924. Mexico and Michoacán (type from Tlalpujahua).
- Quercus innuncupata* Trel. Mem. Nat. Acad. Sci. 20: 77. pl. 108. 1924. Michoacán, the type from Loma de Santa María.
- Quercus revoluta* Trel. Mem. Nat. Acad. Sci. 20: 78. pl. 111, 112. 1924. Puebla, the type from Honey Station.
- Quercus loeseneri* Trel. Mem. Nat. Acad. Sci. 20: 79. pl. 110. 1924. Type from Saltillo, Coahuila.
- Quercus deserticola* Trel. Mem. Nat. Acad. Sci. 20: 79. pl. 113, 114. 1924. Querétaro and Hidalgo; type from Desierto.
- Quercus alveolata* Trel. Mem. Nat. Acad. Sci. 20: 80. pl. 114. 1924. Type from Cerro del Gavilán, Puebla.
- Quercus manzanillana* Trel. Mem. Nat. Acad. Sci. 20: 80. pl. 116. 1924. Type from Manzanilla, near Puebla.
- Quercus lecomteana* Trel. Mem. Nat. Acad. Sci. 20: 81. pl. 115. 1924. Type from Perote, Veracruz.
- Quercus vallicola* Trel. Mem. Nat. Acad. Sci. 20: 81. pl. 116. 1924. Type from Santa Fe, Valley of Mexico.
- Quercus texcocana* Trel. Mem. Nat. Acad. Sci. 20: 81. pl. 117. 1924. Valley of Mexico, the type from Texcoco.
- Quercus subtriloba* Trel. Mem. Nat. Acad. Sci. 20: 81. pl. 118. 1924. Type from Hidalgo.
- Quercus frutex* Trel. Mem. Nat. Acad. Sci. 20: 82. pl. 120. 1924. Valley of Mexico, the type from Cuautepec.
- Quercus alpescens* Trel. Mem. Nat. Acad. Sci. 20: 83. pl. 122. 1924. Type from "Mt. Kankandó."
- Quercus potosina* Trel. Mem. Nat. Acad. Sci. 20: 84. pl. 123-125. 1924. Type from San Luis Potosí.
- Quercus cordifolia* Trel. Mem. Nat. Acad. Sci. 20: 84. pl. 125. 1924. Type from the Sierra Madre, 40 miles south of Saltillo, Coahuila.
- Quercus chihuahuensis* Trel. Mem. Nat. Acad. Sci. 20: 85. pl. 129-131. 1924. Chihuahua (type collected near the city of Chihuahua) and Sonora.
- Quercus jaliscensis* Trel. Mem. Nat. Acad. Sci. 20: 86. pl. 132. 1924. Type collected between Colotlán and Plateado, Jalisco.
- Quercus jaralensis* Trel. Mem. Nat. Acad. Sci. 20: 86. pl. 133, 134. 1924. Coahuila, the type from Jaral.
- Quercus undata* Trel. Mem. Nat. Acad. Sci. 20: 86. pl. 135. 1924. Durango, the type from Sierra de la Candela. "Encino blanco."

- Quercus infralutea* Trel. Mem. Nat. Acad. Sci. 20: 87. *pl. 136.* 1924. Type from Sierra de Alamos, Sonora.
- Quercus invaginata* Trel. Mem. Nat. Acad. Sci. 20: 87. *pl. 137, 138.* 1924. Type from Sierra de la Paila, Coahuila.
- Quercus praeco* Trel. Mem. Nat. Acad. Sci. 20: 88. *pl. 139.* 1924. Type collected between Huejuquilla and Mesquitec, Jalisco.
- Quercus convallata* Trel. Mem. Nat. Acad. Sci. 20: 88. *pl. 140.* 1924. Type from Sierra de Nayarit, Huichol, Jalisco.
- Quercus pallescens* Trel. Mem. Amer. Acad. Sci. 20: 89. *pl. 141.* 1924. Type from Bolaños, Jalisco.
- Quercus sacame* Trel. Mem. Nat. Acad. Sci. 20: 89. *pl. 142.* 1924. Chihuahua, the type from "Bajío de Tonachic," Sierra Madre. "Rojaca sacamé," "encino manzano."
- Quercus bipedalis* Trel. Mem. Nat. Acad. Sci. 20: 89. *pl. 143.* 1924. Type from Santa Teresa, Tepic.
- Quercus depressipes* Trel. Mem. Nat. Acad. Sci. 20: 90. *pl. 144.* 1924. Type from Sierra de la Candela, Durango. "Encinillo."
- Quercus perpallida* Trel. Mem. Nat. Acad. Sci. 20: 91. *pl. 147.* 1924. Type from Sierra de Alamos, Sonora.
- Quercus opaca* Trel. Mem. Nat. Acad. Sci. 20: 92. *pl. 148.* 1924. Type from Ixmiquilpan, Hidalgo.
- Quercus sebifera* Trel. Mem. Nat. Acad. Sci. 20: 93. *pl. 149.* 1924. Type from Comitán, Chiapas.
- Quercus schenckiana* Trel. Mem. Nat. Acad. Sci. 20: 93. *pl. 150.* 1924. Type from Sierra de Mixteca near San Luis, Puebla.
- Quercus ceripes* Trel. Mem. Nat. Acad. Sci. 20: 93. *pl. 150.* 1924. Type from Cerro de Paxtla, near Tehuacán, Puebla.
- Quercus striatula* Trel. Mem. Nat. Acad. Sci. 20: 93. *pl. 151, 152.* 1924. Durango (type from Sierra de la Candela, at 3,000 meters), Tepic, and Zacatecas.
- Quercus hartmani* Trel. Mem. Nat. Acad. Sci. 20: 95. *pl. 154.* 1924. Chihuahua, the type from Puerta de San Diego, at 2,100 meters.
- Quercus undulata* Torr. Ann. Lyc. N. Y. 2: 248. *pl. 4.* 1828. Chihuahua. Southwestern United States.
- Quercus sillae* Trel. Mem. Nat. Acad. Sci. 20: 102. *pl. 171.* 1924. Type from La Silla, near Monterrey, Nuevo León.
- Quercus nitidissima* Trel. Mem. Nat. Acad. Sci. 20: 122. *pl. 218.* 1924. Type from Cadereyta, Querétaro.
- Quercus duraznillo* Trel. Mem. Nat. Acad. Sci. 20: 122. *pl. 220, 221.* 1924. Chihuahua (type collected between Baquiriachic and La Joya), Sonora, and Durango. "Encino duraznillo," "encino colorado," "encino."
- Quercus balsequillana* Trel. Mem. Nat. Acad. Sci. 20: 123. *pl. 220.* 1924. Type from Río Balsequillo, Chihuahua.
- Quercus viminea* Trel. Mem. Nat. Acad. Sci. 20: 123. *pl. 222.* 1924. Chihuahua (type from Agua Caliente de Huachara) and Sonora.
- Quercus bolanyosensis* Trel. Mem. Nat. Acad. Sci. 20: 123. *pl. 223.* 1924. Jalisco (type collected west of Bolaños) and Tepic.
- Quercus peninsularis* Trel. Mem. Nat. Acad. Sci. 20: 124. *pl. 225.* 1924. Baja California, the type from San Pedro Mártir.
- Quercus epileuca* Trel. Mem. Nat. Acad. Sci. 20: 126. *pl. 229.* 1924. Sonora (type from Sierra del Nacori, at 1,800 meters) and Michoacán.
- Quercus campanariensis* Trel. Mem. Nat. Acad. Sci. 20: 126. *pl. 228.* 1924. Type from Campanario, near Morelia, Michoacán.

- Quercus incarnata* Trel. Mem. Nat. Acad. Sci. 20: 126. pl. 229-231. 1924. Chihuahua (type collected between Ojitos and Bocoyna, at 2,500 meters), Durango, and Michoacán, "Encino prieto."
- Quercus felipensis* Trel. Mem. Nat. Acad. Sci. 20: 129. pl. 237. 1924. Oaxaca, the type from Cerro de San Felipe, at 2,600 meters or more.
- Quercus moreliana* Trel. Mem. Nat. Acad. Sci. 20: 130. pl. 241. 1924. Type from Campanario, Morelia, Michoacán.
- Quercus errans* Trel. Mem. Nat. Acad. Sci. 20: 131. pl. 245. 1924. Veracruz (type from Perote) and Hidalgo.
- Quercus hahnii* Trel. Mem. Nat. Acad. Sci. 20: 131. pl. 247. 1924. Hidalgo (type from forest of Cajalpa, near Toluca) and Distrito Federal.
- Quercus esperanzae* Trel. Mem. Nat. Acad. Sci. 20: 132. pl. 248. 1924. Type from Esperanza, Puebla.
- Quercus orbiculata* Trel. Mem. Nat. Acad. Sci. 20: 132. pl. 249. 1924. Type from San Luis Potosí.
- Quercus miguelitensis* Trel. Mem. Nat. Acad. Sci. 20: 132. pl. 249. 1924. Type from mountains of San Miguelito, San Luis Potosí.
- Quercus urbani* Trel. Proc. Amer. Phil. Soc. 60: 32. pl. 2. 1921. Type from Michoacán or Guerrero, at 1,800 meters.
- Quercus radiata* Trel. Proc. Amer. Phil. Soc. 60: 33. pl. 3. 1921. Type collected near Santa Teresa, Tepic.
- Quercus konzattii* Trel. Proc. Amer. Phil. Soc. 60: 33. pl. 4. 1921. Type from Cuesta de Huauchillo, Nochixtlán, Oaxaca, at 2,000 meters.
- Quercus tepicana* Trel. Mem. Nat. Acad. Sci. 20: 135. pl. 255. 1924. Type from Pedro Paulo, Tepic.
- Quercus pennivenia* Trel. Mem. Nat. Acad. Sci. 20: 135. pl. 256. 1924. Chihuahua and Sonora; type from some unknown locality in the Sierra Madre.
- Quercus aerea* Trel. Mem. Nat. Acad. Sci. 20: 135. pl. 257. 1924. Type from La Bufa, Cosihuiriachic, Chihuahua.
- Quercus jonesi* Trel. Mem. Nat. Acad. Sci. 20: 136. pl. 257. 1924. Type from Chiquilistlán, Jalisco.
- Quercus coccolobaefolia* Trel. Mem. Nat. Acad. Sci. 20: 136. pl. 258. 1924. San Luis Potosí and Guanajuato (type from Santa Rosa).
- Quercus planipocula* Trel. Mem. Nat. Acad. Sci. 20: 136. pl. 259. 1924. Tepic (type from foothills near Pedro Paulo) and Sinaloa.
- Quercus rosei* Trel. Mem. Nat. Acad. Sci. 20: 137. pl. 260. 1924. Type from Santa Teresa, Tepic.
- Quercus coffeaecolor* Trel. Mem. Nat. Acad. Sci. 20: 137. pl. 261. 1924. Type from foothills near Colomas, Sinaloa.
- Quercus aequivenulosa* Trel. Mem. Nat. Acad. Sci. 20: 138. pl. 261. 1924. Type collected near Santa Teresa, Tepic.
- Quercus praineana* Trel. Mem. Nat. Acad. Sci. 20: 138. pl. 262. 1924. Type from mountains near Etzatlán, Jalisco.
- Quercus langlassei* Trel. Mem. Nat. Acad. Sci. 20: 138. pl. 263. 1924. Sinaloa to Michoacán.
- Quercus chiquihuitillonis* Trel. Mem. Nat. Acad. Sci. 20: 139. pl. 264. 1924. Michoacán and Guerrero; type from Chiquihuitillo, at 900 meters.
- Quercus productipes* Trel. Mem. Nat. Acad. Sci. 20: 140. pl. 264. 1924. Type from "mountains east of S. Leonel, toward Tepic."
- Quercus exaristata* Trel. Mem. Nat. Acad. Sci. 20: 140. pl. 266. 1924. Type from Pedro Paulo, Tepic.
- Quercus endlichiana* Trel. Mem. Nat. Acad. Sci. 20: 141. pl. 267. 1924. Durango (type from Sierra de la Candela) and Chihuahua. "Encino," "roble," "rojaca," "rocuró."

- Quercus trinitatis** Trel. Mem. Nat. Acad. Sci. 20: 144. pl. 277. 1924. Type from Trinidad, Hidalgo.
- Quercus crispifolia** Trel. Mem. Nat. Acad. Sci. 20: 147. pl. 286. 1924. Type from Finca San Juan de las Chicharras, Tapachula, Chiapas.
- Quercus incrassata** Trel. Mem. Nat. Acad. Sci. 20: 147. pl. 287. 1924. Type from Finca San Juan de las Chicharras, Tapachula, Chiapas.
- Quercus botryocarpa** Trel. Mem. Nat. Acad. Sci. 20: 150. pl. 295. 1924. Type from foothills near Pedro Paulo, Tepic.
- Quercus synthetica** Trel. Mem. Nat. Acad. Sci. 20: 151. pl. 296, 297. 1924. Type from Huatusco, Veracruz.
- Quercus acapulcensis** Trel. Mem. Nat. Acad. Sci. 20: 153. pl. 302. 1924. Type from Acapulco, Guerrero.
- Quercus tahuasalana** Trel. Mem. Nat. Acad. Sci. 20: 154. pl. 302. 1924. Michoacán; type from El Tahuasal. "Encino prieto."
- Quercus caeruleocarpa** Trel. Mem. Nat. Acad. Sci. 20: 163. pl. 321. 1924. Type from Contreras, Distrito Federal.
- Quercus zempoaltepecana** Trel. Mem. Nat. Acad. Sci. 20: 164. pl. 323. 1924. Oaxaca, the type from Mount Zempoaltepec.
- Quercus cuajimalpana** Trel. Mem. Nat. Acad. Sci. 20: 165. pl. 324. 1924. Type from Cuajimalpa, Distrito Federal.
- Quercus bourgaei** Oerst.; Trel. Mem. Nat. Acad. Sci. 20: 168. pl. 336. 1924. Valley of Mexico, the type from San Nicolás.
- Quercus subavenia** Trel. Mem. Nat. Acad. Sci. 20: 169. pl. 338. 1924. Type from Honey Station Puebla.
- Quercus hypoxantha** Trel. Mem. Nat. Acad. Sci. 20: 170. pl. 339. 1924. Type from mountains near Saltillo, Coahuila, at 2,300 meters.
- Quercus imbricariaefolia** Trel. Mem. Nat. Acad. Sci. 20: 174. pl. 348. 1924. Hidalgo (type from Real del Monte) and Mexico.
- Quercus colimae** Trel. Mem. Nat. Acad. Sci. 20: 174. pl. 349. 1924. Type from Cerro Grande, Jalisco. "Encino blanco," "encino blanco chino," "zau-cillo," "chilillo."
- Quercus malifolia** Trel. Mem. Nat. Acad. Sci. 20: 175. pl. 348. 1924. Type from San Andrés Chalchicomula, Volcán de Orizaba.
- Quercus obovalifolia** Fourn.; Trel. Mem. Nat. Acad. Sci. 20: 175. pl. 351. 1924. Type from Valley of Mexico.
- Quercus axillaris** Fourn.; Trel. Mem. Nat. Acad. Sci. 20: 176. pl. 352. 1924. Type from San Nicolás, Valley of Mexico.
- Quercus subcrispata** Trel. Mem. Nat. Acad. Sci. 20: 176. pl. 353. 1924. Type from Manzanilla, Puebla.
- Quercus circummontana** Trel. Mem. Nat. Acad. Sci. 20: 177. pl. 356. Veracruz (type from Mirador) and Michoacán.
- Quercus fournieri** Trel. Mem. Nat. Acad. Sci. 20: 177. pl. 357. 1924. Type from foot of Cofre de Perote, Veracruz.
- Quercus serrulata** Trel. Mem. Nat. Acad. Sci. 20: 179. pl. 361. 1924. Type from Chiquilistlán, Jalisco.
- Quercus alamosensis** Trel. Mem. Nat. Acad. Sci. 20: 179. pl. 361. 1924. Type from Sierra de Alamos, Sonora.
- Quercus rossii** Trel. Mem. Nat. Acad. Sci. 20: 179. pl. 362. 1924. Tepic and Jalisco to Michoacán; type from Araparicuaro, Arrio de Rosales, Michoacán. "Encino prieto," "encino colorado."
- Quercus tepoxuchilensis** Trel. Mem. Nat. Acad. Sci. 20: 180. pl. 363. 1924. Puebla, the type from Tepoxúchil.
- Quercus simillima** Trel. Mem. Nat. Acad. Sci. 20: 180. pl. 363. 1924. San Luis Potosí.

Quercus impressa Trel. Mem. Nat. Acad. Sci. 20: 181. pl. 364. 1924. Type from Salomé, Oaxaca.

Quercus seleri Trel. Mem. Nat. Acad. Sci. 20: 181. pl. 364. 1924. Type from Casa de Tepozteco, Morelos, at 2,000 meters.

Quercus roseoventulosa Trel. Mem. Nat. Acad. Sci. 20: 182. pl. 366. 1924. Type from Salto de Agua, Mexico.

Quercus sipuraca Trel. Mem. Nat. Acad. Sci. 20: 182. pl. 366. 1924. Chihuahua, the type from "Bajío de Tonachic." "Sipúraca," "encino Colorado," "encino cascalote."

Quercus acherodophylla Trel. Mem. Nat. Acad. Sci. 20: 183. pl. 367. 1924. Type from Honey Station, Puebla.

Quercus saltillensis Trel. Mem. Nat. Acad. Sci. 20: 183. pl. 368, 369. 1924. Type collected 40 miles south of Saltillo, Coahuila.

Quercus carnerosana Trel. Mem. Nat. Acad. Sci. 20: 183. pl. 369. 1924. Type from Carneros Pass, Coahuila.

Quercus cerifera Trel. Mem. Nat. Acad. Sci. 20: 184. pl. 370. 1924. Type from Bajucua, Chiapas.

Quercus crispipilis Trel. Mem. Nat. Acad. Sci. 20: 184. pl. 370. 1924. Chiapas. Guatemala, the type from Uaxac Canal.

Quercus canbyi Trel. Mem. Nat. Acad. Sci. 20: 188. pl. 379, 380. 1924. Type from Monterrey, Nuevo León.

Quercus karwinskii Trel. Mem. Nat. Acad. Sci. 20: 188. pl. 379. 1924. Type from some unknown locality in Mexico.

Quercus tonaguaiae Trel. Mem. Nat. Acad. Sci. 20: 190. pl. 385. 1924. Type from Tonagua, Oaxaca.

Quercus vexans Trel. Mem. Nat. Acad. Sci. 20: 190. pl. 386. 1924. Type from Huatusco, Veracruz.

Quercus candolleana Trel. Mem. Nat. Acad. Sci. 20: 191. pl. 387. 1924. Type from Huatusco, Veracruz.

Quercus conspersa Benth. Pl. Hartw. 92. 1842. Chiapas. Guatemala, the type from Las Casillas Mountains.

Quercus albocincta Trel. Mem. Nat. Acad. Sci. 20: 193. pl. 394. 1924. Type from Sierra de Alamos, Sonora.

ULMACEAE.

Page 201. After *Celtis* insert the following genus:

PHYLLOSTYLON Capanema; Benth. & Hook. Gen. Pl. 3: 35. 1880.

1. *Phyllostylon brasiliensis* Capanema; Benth. & Hook. Gen. Pl. 3: 352. 1880.

Tamaulipas, San Luis Potosí, and Hidalgo. Cuba, Hispaniola, and South America; type from Brazil.

A large tree whose wood is of some value. Known in Mexico as "cerón."

MORACEAE.

Page 203. *Chlorophora tinctoria*. "Mora amarilla" (Sinaloa).

Page 210. *Ficus cotinifolia*. "Tescalama," "chipil," "capulina" (Sinaloa).

Page 213. *Fiscus goldmani*. "Salate" (Sinaloa).

URTICACEAE.

Page 219. *Urcera caracasana*. "Ortiguilla" (Sinaloa).

Page 221. *Pouzolzia nivea*. "Samo el coche," "samo prieto" (Sinaloa).

After *Pouzolzia pringlei* insert:

Pouzolzia occidentalis Wedd. Arch. Mus. Paris 9: 410. 1856. *Pouzolzia purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 404. 1924. Chiapas West Indies, Central America, and northern South America.

LORANTHACEAE.

- Page 223. *Razoumofskya vaginata*. "Tojo" (Chihuahua); "pasto de pino" (Chihuahua).
- Page 227. *Phoradendron schumannii*. "Pasto de encino" (Chihuahua).
Phoradendron nervosum. "Lirio," "lirio parásito" (Veracruz).
- Page 228. *Phoradendron californicum*. "Tojo" (Sinaloa).
Phoradendron ligatum. "Pasto" (Chihuahua).
- Page 229. *Phoradendron bolleanum*. "Pasto de madroño" (Chihuahua).
Phoradendron velutinum. "Liga," "muérdago" (Mexico). A decoction of the leaves and flowers is employed as a remedy for wounds.
- Page 231. *Phoradendron tomentosum*. "Pasto de encino" (Chihuahua).
- Page 233. *Struthanthus quercicola*. "Correguela" (Veracruz).
Struthanthus haenkeanus. "Tojo" (Sinaloa).
- Page 235. *Psittacanthus calyculatus*. "Lirio," "lirio parásito," "matapalo," "muérdago" (Veracruz).

OPILIACEAE.

- Page 236. *Agonandra racemosa*. "Margarita" (Sinaloa).

OLACACEAE.

- Page 237. *Ximenia pubescens*. Reported also from Baja California.
Ximenia parviflora. "Nanche" (Sinaloa).

ARISTOLOCHIACEAE.

- Page 241. *Aristolochia taliscana*. "Guaco," "bejuco guaco" (Sinaloa).

POLYGONACEAE.

- Page 246. *Coccoloba schiedeana*. "Roble de la costa" (Sinaloa).
 After *Coccoloba acapulcensis* insert:
Coccoloba petrophila T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 404. 1924.
 Type from Camarón, Veracruz.

CHENOPODIACEAE.

- Page 252. To the species of *Atriplex* add:
Atriplex hymenelytra (Torr.) S. Wats. Proc. Amer. Acad. 9: 119. 1874.
Obione hymenelytra Torr. U. S. Rep. Expl. Miss. Pacif. 4: 129. pl. 20. 1857.
 Northern Baja California. California to Arizona.
- Page 253. *Dondia*. The name "chamiso" is reported from Sinaloa for a species of doubtful identity.

AMARANTHACEAE.

- Page 256. *Chamissoa altissima*. "Cuaumecate barba de viejo" (Sinaloa).
Lagrezia monosperma. "Tacote" (Colima). The species has been collected also in Oaxaca.
- Page 258. *Iresine interrupta*. "Viejos" (Sinaloa).

ALLIONIACEAE.

- Page 261. *Pisonia aculeata*. "Garabato blanco" (Nayarit). To the synonymy of this species add: *Pisonia purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 404. 1924.
- Page 260. After *Neea sphaerantha* insert:
Neea chiapensis Standl. Journ. Washington Acad. Sci. 19: 14. 1926.
 Mountains east of Monserrate, Chiapas.

BATIDACEAE.

Page 263. *Batis maritima*. "Saladilla" (Tamaulipas); "vidrillo," "chamís" (Sinaloa).

PHYTOLACCACEAE.

Page 263. *Stegnosperma halimifolium*. "Ojo de zanate" (Sinaloa).

Page 264. *Phaulothamnus spinescens*. "Putia" (Sinaloa). This shrub has been collected also in Texas, and doubtless occurs in northeastern Mexico.

Petiveria alliacea. "Rama del zorrillo," "jupachumi" (Sinaloa).

Page 265. *Rivina humilis*. "Colorín" (Sinaloa).

RANUNCULACEAE.

Page 267. *Clematis drummondii*. "Barbas de chivato" (Sinaloa).

MENISPERMACEAE.

Page 273. To the genus *Hyperbaena* the following species are to be added:

Hyperbaena ilicifolia Standl. Proc. Biol. Soc. Washington 37: 43. 1924.
Type from Cayaco, Michoacán.

Hyperbaena denticulata Standl. Proc. Biol. Soc. Washington 37: 44. 1924.
Type from Manzanillo, Colima.

LAURACEAE.

Page 286. The date of Mez's monograph of the American Lauraceae is 1889, not 1869.

Acrodiclidium misantlae T. S. Brandeg. is a synonym of *Ocotea veraguensis*; see below.

Page 290. *Persea americana*. For "ahuacuahuítl" read "ahuacaquahuítl." The name "xinene" should be placed under *P. schiedeana* (page 289). The name "palta" is said not to be in use in Colombia.

Page 291. Place as synonym under *P. podadenia*: *Persea podadenia glabri-ramea* I. M. Johnston, Contr. Gray Herb. n. ser. 70: 69. 1924. The type of this variety is from Orizaba.

Page 292. *Persea liebmanni*. "Tepehuacate" (Sinaloa).

To the species of *Persea* add:

Persea hartmannii I. M. Johnston, Contr. Gray Herb. n. ser. 70: 69. 1924.
Type from Batopilas, Chihuahua.

Sassafridium macrophyllum. "Laurelillo" (Nayarit); "haya" (Sinaloa).

Misanteca jurgensenii. "Aguacatillo" (Oaxaca).

Page 294. In the synonymy of *Phoebe tampicensis*, for "*Ocotea angustata*" read "*Phoebe angustata*."

Page 295. To the species of *Phoebe* add:

Phoebe longipes I. M. Johnston, Contr. Gray Herb. n. ser. 70: 69. 1924.
Type from Mexico, the locality not known.

Ocotea veraguensis. To the synonymy add: *Acrodiclidium misantlae* T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 497. 1919.

Page 296. After *Ocotea klotzschiana* insert:

Ocotea pyramidata Blake, Univ. Calif. Publ. Bot. 7: 326. 1920. Type from Zacuapan, Veracruz.

HERNANDIACEAE.

Page 298. *Gyrocarpus americanus*. "Jutamo" (Sinaloa).

After *Gyrocarpus* insert the following genus:

SPARATTANTHELIUM Mart. Flora 1841²: Beibl. 40. 1841.

According to Hemsley, specimens of this genus were collected in southern Mexico by Jurgensen. They may perhaps be referable to the Guatemalan species described recently by the writer (Proc. Biol. Soc. Washington 37: 51. 1924) as *Sparattanthelium guatemalense*.

PAPAVERACEAE.

Page 300. *Bocconia arborea*. "Chicolate" (Nayarit).

CAPPARIDACEAE.

Page 303. *Capparis flexuosa*. "Mimbre del monte," "tablelojeca" (Sinaloa).

Page 304. *Capparis indica*. "Palo zapo," "vara prieta" (Sinaloa).

After *Capparis indica* add:

Capparis mollicella Standl. Proc. Biol. Soc. Washington 37: 44. 1924. Type from La Bajada, Nayarit.

Page 305. *Crataeva tapia*. "Perihuate," (Sinaloa); "trompo" (Guerrero).

Forchammeria. The genus has been treated recently by Standley (Journ. Washington Acad. Sci. 14: 269-272. 1924).

Page 306. *Forchammeria macrocarpa*. A synonym is *F. purpusii* Loesener, Repert. Sp. Nov. Fedde 16: 204. Dec. 31, 1919.

Forchammeria lanceolata. This is *Drypetes crocea*; see page 1671.

After *Forchammeria lanceolata* insert:

Forchammeria longifolia Standl. Journ. Washington Acad. Sci. 14: 271. 1924. Type from Pueblo Nuevo, Veracruz.

Forchammeria sessilifolia Standl. Journ. Washington Acad. Sci. 14: 272. 1924. Type from María Madre Island.

HYDRANGEACEAE.

Page 308. After *Hydrangea oerstedii* insert:

Hydrangea seemannii Riley, Kew Bull. 1924: 207. 1924. Type from the Sierra Madre. The "Sierra Madre" reference under *H. oerstedii* pertains to this species.

ESCALLONIACEAE.

Page 313. After *Phyllonoma laticuspis* insert:

Phyllonoma coriacea Riley, Kew Bull. 1924: 208. 1924. Type from the Sierra Madre. Reported by Seemann as *Dulongia acuminata* H. B. K.

Page 316. Before Cunoniaceae insert the following family:

BRUNELLIACEAE. Brunellia Family.

1. **BRUNELLIA** Ruiz & Pav. Fl. Peruv. Chil. Prodr. 71. 1794.

1. *Brunellia comocladifolia* Humb. & Bonpl. Pl. Aequin. 1: 211. 1808. Southern Mexico. Costa Rica, West Indies, and South America.

The plant described by Hooker and Arnott (Bot. Beechey Voy. 282. 1837-39) from Tepic as *Brunellia ? quadrilocularis* is unknown to the present writer.

MALACEAE.

Page 337. *Amelanchier denticulata*. "Tomistlacati" (Guerrero). Reported as a tree of 3 to 9 meters.

AMYGDALACEAE.

Page 343. *Licania arborea*, "Palo carnero" (Oaxaca).

KRAMERIACEAE.

Page 348. *Krameria bicolor*. "Tajuy," "guachapurillo" (Sinaloa).

MIMOSACEAE.

Page 351. *Prosopis juliflora* and its synonyms should be placed in synonymy under the following, the proper name for the species:

Prosopis chilensis (Molina) Stuntz, U. S. Dept. Agr. Bur. Pl. Ind. Inv. Seeds 31: 85. 1914. *Cerantonia chilensis* Molina, Sagg. Stor. Nat. Chile 172. 1782.

Page 353. For *Prosopis juliflora velutina* substitute **Prosopis chilensis velutina** (Wooton) Standl.

For *Prosopis juliflora glandulosa* substitute **Prosopis chilensis glandulosa** (Torr.) Standl.

Page 354. *Piptadenia constricta*. "Iguano blanco" (Sinaloa). This species extends also to El Salvador, where it is known as "lengua de vaca" and "quebracho."

Page 355. *Goldmania foetida*. "Sicoche" (Sinaloa).

Page 359. *Mimosa distachya*. "Cuca de árbol" (Sinaloa).

Mimosa polyantha. "Gatuño" (Sinaloa).

Page 361. *Mimosa albida*. "Tapa vergüenza" (Veracruz).

Page 362. *Mimosa pigra*. "Coatante" (Nayarit).

Page 366. After *Mimosa aculeaticarpa* insert:

Mimosa chaetocarpa T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 182. 1922. Type from Camarón, Veracruz.

Mimosa endlichii Harms, Repert. Sp. Nov. Fedde 18: 93. 1922. Type from Río San Juan, Chihuahua.

Page 368. *Leucaena lanceolata*. "Bolillo" (Sinaloa).

Leucaena diversifolia. "Guaje" (Guerrero).

Page 373. *Acacia cochliacantha*. For the Mexican material referred here the name *Acacia cymbispina* Sprague and Riley has been proposed (Kew Bull. Misc. Inf. 1923: 394. 1923). The authors state that the Mexican plant is specifically distinct from that occurring in Ecuador. The species is known in Sinaloa also as "vinolo."

Page 374. *Acacia macracantha*. "Algarrobo," "espinas de tinto" (Sinaloa).

Page 375. *Acacia hindsii*. "Jarretadera" (Sinaloa, Nayarit).

Page 377. *Acacia millefolia*. "Mauto" (Sinaloa).

Page 378. *Acacia acatlensis*. "Huajillo" (Puebla).

Page 381. *Acacia angustissima*. "Day" (Sinaloa).

Page 385. *Calliandra anomala*. This and its synonyms should be referred to synonymy under the following:

Calliandra grandiflora (L'Hér.) Benth. Journ. Bot. Hook. 2: 139. 1840. *Mimosa grandiflora* L'Hér. Sert. Angl. 30. 1788. See Riley, Kew Bull. 1923: 397. 1923.

Page 386. *Calliandra houstoniana*. "Chivato grande" (Sinaloa).

Page 380. *Acacia crassifolia*. A synonym of this is *Bauhinia lunarioides* A. Gray (see page 417).

Page 388. After *Calliandra capillata* insert:

Calliandra langlassei Harms, Repert. Sp. Nov. Fedde 17: 87. 1921. Type from Chichihualco, Guerrero.

Calliandra mexicana T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 183. 1922. Type from Remudadero, Veracruz.

Calliandra seleri Harms, Repert. Sp. Nov. Fedde 17: 90. 1921. Type from Hacienda Santa Rita, near Zapaluta, Distrito de Comitán, Chiapas.

Calliandra scopulina T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 183. 1922. Type from Camarón, Veracruz.

Calliandra socorrensis I. M. Johnston, Contr. Gray Herb. n. ser. 70: 71. 1924. Type from Socorro Island.

Page 388. *Lysiloma*. Since the generic name is neuter, the species names should have neuter endings.

Page 390. *Lysiloma divaricatum*. "Mauto" (Sinaloa).

Page 390. *Albizzia occidentalis*. "Trucha," "cico" (Sinaloa).

Page 391. After *Albizzia occidentalis* insert:

Albizzia tomentosa (Micheli) Standl. Journ. Washington Acad. Sci. **13**: 6. 1923. *Pithecollobium tomentosum* Micheli, Mém. Soc. Phys. Hist. Nat. Genève **34**: 285. pl. 28. 1903. The tree occurs also in Sinaloa, where it is known as "palo joso." See page 396.

Page 393. *Pithecollobium lanccolatum*. "Guamúchil bronco" (Sinaloa); "humo cimarrón" (Tamaulipas). The proper name for this species is **Pithecollobium ligustrinum** (Jacq.) Klotzsch. The date of publication of *Mimosa ligustrina* Jacq. should be 1800–1806 (see Riley, Kew Bull. **1923**: 400. 1923).

Pithecollobium calostachys. "Conchi" (Sinaloa).

Page 395. *Pithecollobium arboreum*. "Cañamazo" (Oaxaca). Dr. Reko states that this species is sometimes a tree of 20 meters or more.

Page 396. *Pithecollobium tortum*. "Cucharo," "palo fierro" (Sinaloa).

Pithecollobium tomentosum. This is *Albizzia tomentosa* (Micheli) Standl.; see above.

Page 397. *Pithecollobium mexicanum*. "Manto," "rama de chivato" (Sinaloa).

After *Pithecollobium mexicanum* add:

Pithecollobium caesalpinoides Standl. Proc. Biol. Soc. Washington **37**: 45. 1924. Type from El Zapote, Mazatlán, Sinaloa. "Tempisque," "guay-pinole."

Pithecollobium latifolium (L.) Benth. Lond. Journ. Bot. **3**: 214. 1844. *Mimosa latifolia* L. Syst. Nat. ed. 10. 1310. 1759. Veracruz. Jamaica and Central and South America.

Pithecollobium leucospermum T. S. Brandeg. Univ. Calif. Publ. Bot. **10**: 182. 1922. Type from Camarón, Veracruz.

Pithecollobium paniculatum Pittier, Contr. U. S. Nat. Herb. **20**: 462. 1922. Type from San Gerónimo, Oaxaca.

Pithecollobium pulchellum Pittier, Contr. U. S. Nat. Herb. **20**: 462. 1922. Sinaloa, the type from Culiacán.

Page 399. *Inga xalapensis*. "Juaquiquil" (Nayarit).

After *Inga spuria* insert:

Inga brevipedicellata Harms, Repert. Sp. Nov. Fedde **19**: 62. 1923. Type from Mirador, Veracruz.

Inga endlichii Harms, Repert. Sp. Nov. Fedde **19**: 63. 1923. Type from Jalapa, Veracruz.

Inga latibracteata Harms, Repert. Sp. Nov. Fedde **19**: 64. 1923. Type from Jalapa, Veracruz.

Inga ophylla Riley, Kew Bull. **1923**: 401. 1923. Type from Ignacio, Sinaloa.

Inga sciadodendron Harms, Repert. Sp. Nov. Fedde **19**: 62. 1923. Type from Mirador, Veracruz.

Inga zacuapanica Harms, Repert. Sp. Nov. Fedde **19**: 63. 1923. Type from Zacuapan, Veracruz.

CAESALPINIACEAE.

Page 405. *Cassia ornithopoides* and its synonym should be referred to synonymy under the oldest name for the species: **Cassia uniflora** Mill. Gard. Diet. ed. 8. *Cassia* no. 5. 1768.

Page 407. *Cassia bicapsularis*. "Vicho" (Nayarit).

Page 409. *Cassia biflora*. "Viche" (Sinaloa).

Cassia wislizeni. "Palo prieto," "pinacatillo" (Durango).

Page 410. *Cassia atomaria*. "Mora hedionda" (Sinaloa).

Cassia emarginata. "Retama" (Tamaulipas); "viche" (Sinaloa).

Page 412. *Poeppigia procera*. "Hoja menuda" (Guerrero).

Page 415. *Bauhinia longiflora*. The older name for this species is *B. chlorantha* T. S. Brandeg., of which *B. longiflora* is a synonym.

Page 417. *Bauhinia lunarioides*. This is to be referred to synonymy under *Acacia crassifolia* A. Gray (page 380).

Page 418. *Bauhinia divaricata*. "Pie de cabra" (Oaxaca); "pata de cabro" (Veracruz).

After *Bauhinia latifolia* insert:

Bauhinia jucunda T. S. Brandeg. Univ. Calif. Publ. Bot. 7: 326. 1920. Type from Barranca de Panoaya, Veracruz.

Bauhinia peninsularis T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 183. 1922. Type from Pescadero, Baja California.

Page 423. *Caesalpinia cacalaco*. "Guachalala," "huisache bola" (Sinaloa). The wood gives a good quality of charcoal. The bark is employed as a remedy for toothache. The pods are used for dyeing, and the seeds are said to be eaten.

Page 424. *Caesalpinia platyloba*. "Quebracha," "arellano," "palo Colorado" (Sinaloa).

Page 425. *Caesalpinia gilliesii*. "Tabachín" (Coahuila); "mal de ojo" (Sonora).

Page 426. *Caesalpinia palmeri*. "Palo piojo" (Sinaloa).

Caesalpinia mexicana. "Guajillo" (Nayarit); "viehe" (Sinaloa).

Page 427. After *Caesalpinia yucatanensis* insert:

Caesalpinia ortegae Standl. Journ. Washington Acad. Sci. 13: 6. 1923. Type from Sinaloa.

Delonix regia. "Acacia" (Guerrero).

Conzattia multiflora. "Zopilote" (Puebla); "árbol de águila" (Oaxaca).

Page 428. *Parkinsonia aculeata*. "Bagote" (Sonora); "cacaporo" (Sinaloa).

Parkinsonia microphylla. This has been transferred recently to the genus *Cercidium* (see below).

Page 429. After *Cercidium plurifoliolatum* insert:

Cercidium macrum I. M. Johnston, Contr. Gray Herb. n. ser. 70: 64. 1924. Tamaulipas and Nuevo León.

Cercidium microphyllum (Torr.) Rose & Johnston, Contr. Gray Herb. n. ser. 70: 66. 1924. *Parkinsonia microphylla* Torr. See page 428.

Cercidium molle I. M. Johnston, Proc. Calif. Acad. IV. 12: 1038. 1924. Type from Agua Verde Bay, Baja California.

Cercidium sonorae I. M. Johnston, Contr. Gray Herb. n. ser. 70: 66. 1924. Sonora, the type from Guaymas.

FABACEAE.

Page 433. *Toumatea simplex*. "Limoncillo" (Nayarit).

Page 435. *Sophora tomentosa*. This species has been collected also in Tamaulipas.

Page 436. For *Ormosia* and the specific citation substitute the following:

DUSSIA Krug & Urb. in Duss, Légum. Martiniq. 11. 1891.

1. ***Dussia mexicana*** (Standl.) Harms, Repert. Sp. Nov. Fedde 19: 294. 1924. *Ormosia mexicana* Standl. Contr. U. S. Nat. Herb. 23: 436. 1922.

Page 437. *Crotalaria longirostrata*. "Garbancillo," "tronador" (Sinaloa).

Page 438. *Crotalaria maypurensis*. "Chipilfn" (Oaxaca).

After *Crotalaria anargyroides* insert:

Crotalaria polyphylla Riley, Kew Bull. 1923: 333. 1923. Type from the Sierra Madre.

Page 439. *Indigofera ornithopodioides*. This and its synonyms should be referred to synonymy under the following name: ***Indigofera miniata*** Ortega, Hort. Matr. Dec. 98. 1798.

Indigofera lespedezioides. A synonym of this species is *Indigofera acononiceae* T. S. Brandeg. Univ. Calif. Publ. Bot. 7: 326. 1920.

Page 440. *Indigofera suffruticosa*. *Indigofera truxillensis* H. B. K. (Nov. Gen. & Sp. 6: 456. 1823), reported by Rydberg from Mexico, is scarcely distinct from *I. suffruticosa*.

Page 441. The genus *Indigofera* has been treated recently by Rydberg (N. Amer. Fl. 24: 137-153. 1923), and numerous new species have been described from Mexico. The following should be inserted after *Indigofera thibaudiana*:

Indigofera argentata Rydb. N. Amer. Fl. 24: 143. 1923. Coahuila, the type from Sabinas. Western Texas.

Indigofera brevipes (S. Wats.) Rydb. N. Amer. Fl. 24: 143. 1923. *Indigofera leptosepala brevipes* S. Wats. Proc. Amer. Acad. 17: 342. 1882. Chihuahua to Durango and San Luis Potosí; type from San Rafael Mountains, San Luis Potosí. Southern Texas.

Indigofera constricta Rydb. N. Amer. Fl. 24: 145. 1923. A new name for *I. torulosa* Hook. & Arn. 1836, not *I. torulosa* E. Meyer, 1836. On page 440 the former is referred wrongly to synonymy under *I. mucronata*. Tepic and Guerrero, the type from Tepic.

Indigofera discolor Rydb. N. Amer. Fl. 24: 147. 1923. Sinaloa, the type from Lodiago; Veracruz.

Indigofera hartwegii Rydb. N. Amer. Fl. 24: 144. 1923. A new name for *I. mexicana* Benth. 1848, not *I. mexicana* L. f. 1781. On page 439 the former name is referred to synonymy under *I. ornithopodioides*.

Indigofera laevis Rydb. N. Amer. Fl. 24: 144. 1923. Type from Guaymas, Sonora.

Indigofera lancifolia Rydb. N. Amer. Fl. 24: 147. 1923. Type from Acapulco, Guerrero.

Indigofera langlassei Rydb. N. Amer. Fl. 24: 147. 1923. Sinaloa to Guerrero; type from the Sierra Madre of Michoacán or Guerrero.

Indigofera nana Rydb. N. Amer. Fl. 24: 143. 1923. Type from Punguato, near Morelia, Michoacán.

Indigofera nelsonii Rydb. N. Amer. Fl. 24: 150. 1923. Sonora and Baja California; type collected between La Laguna and El Paraíso, Baja California. Perhaps synonymous with this is *I. argentata* I. M. Johnston (Proc. Calif. Acad. IV. 12: 1043. 1924, not *I. argentata* Rydb. 1923), described from Cerralbo Island, Baja California.

Indigofera pueblensis Rydb. N. Amer. Fl. 24: 150. 1923. Type from Cerro de la Yerba, San Luis Tultitlanapa, Puebla.

Indigofera purpusi T. S. Brandeg. Univ. Calif. Publ. Bot. 6: 499. 1919. Veraacruz, Mexico, and Oaxaca; type from Barranca de Tenampa, Veracruz.

Indigofera rosei Rydb. N. Amer. Fl. 24: 145. 1923. Zacatecas and Puebla; type from San Juan Capistrano, Zacatecas.

Indigofera sphenoides Rydb. N. Amer. Fl. 24: 142. 1923. Type from San Dieguito, San Luis Potosí.

Page 454. *Parosela diffusa*. "Escoba" (Morelos); "escoba colorada" (Sinaloa).

Page 455. *Parosela zimapanica*. "Hierba hedionda" (Oaxaca).

Page 458. *Parosela greggii*. "Orégano cimarrón" (Coahuila, Endlich). Probably an erroneous name.

Page 459. *Parosela wislizeni*, "Mariola" (Chihuahua, Endlich).

Page 460. *Parosela megacarpa*. To the synonymy add: *Errazurizia megacarpa* I. M. Johnston, Proc. Calif. Acad. IV. 12: 1042. 1924.

Page 463. *Parosela seemanni*. "Engorda cabra" (Zacatecas).

Page 464. *Parosela dorycnoides*. "Engorda cabra" (Durango).

Page 465. After *Parosela decora* insert:

Parosela arsenei Macbride, Contr. Gray Herb. n. ser. **65**: 21. 1922. Type from Morelia, Michoacán.

Parosela caeciliae (Harms) Standl. *Dalea caeciliae* Harms, Verh. Bot. Ver. Brandenb. **56**: 87. 1923. Type from Cerro del Pueblo Viejo, Distrito de Teposcolula, Oaxaca.

Parosela loeseneriana (Harms) Standl. *Dalea loeseneriana* Harms. Verh. Bot. Ver. Brandenb. **56**: 88. 1923. Type from El Parián, Oaxaca.

Parosela longeracemosa T. S. Brandeg. Univ. Calif. Publ. Bot. **10**: 184. 1922. Type from Minas de San Rafael, San Luis Potosí.

Page 466. *Brongniartia*. The genus has been monographed by Rydberg (N. Amer. Fl. **24**: 186-197. 1923).

Page 467. *Brongniartia podalyrioides*. "Hierba de la víbora" (Sinaloa). To the synonyms of this species add: *Astragalus frutescens* Kunth, Ind. Sem. Hort. Berol. **1845**: 12. 1845. *Brongniartia bilabiata* Micheli, listed as a synonym of *B. podalyrioides*, is recognized by Rydberg as a distinct species, known only from the type locality, Río San Luis, Michoacán or Guerrero.

Page 468. *Brongniartia lasiocarpa*. According to Rydberg this is a synonym of *Brongniartia oligosperma* Baill. (*Adansonia* **9**: 240. 1870), listed on page 470 among the doubtful species as "*B. oligospermoides*."

Page 469. *Brongniartia intermedia*. "Hierba de la víbora." (Sinaloa.)

After *Brongniartia intermedia* insert:

Brongniartia caeciliae Harms, Repert. Sp. Nov. Fedde **18**: 95. 1922. Type collected between Chicapa and Izhuatán, Juchitán, Oaxaca.

Brongniartia seleri Harms, Repert. Sp. Nov. Fedde **18**: 95. 1922. Type from Mitla, Oaxaca.

Brongniartia paniculata Rose; Rydb. N. Amer. Fl. **24**: 189. 1923. Type from Cuernavaca, Morelos.

Brongniartia pauciflora Rose; Rydb. N. Amer. Fl. **24**: 191. 1923. Type from Río Quintepec, Distrito de Cuicatlán, Oaxaca.

Brongniartia alamosana Rydb. N. Amer. Fl. **24**: 192. 1923. Type from Alamos, Sonora.

Brongniartia strigillosa Rydb. N. Amer. Fl. **24**: 192. 1923. Type from Acaponeta, Tepic.

Brongniartia canescens (S. Wats.) Rydb. N. Amer. Fl. **24**: 193. 1923. *B. minutifolia canescens* S. Wats. Proc. Amer. Acad. **23**: 271. 1888. Type from Ortiz, Chihuahua.

Brongniartia angustata Rydb. N. Amer. Fl. **24**: 194. 1923. Michoacán, Puebla, and Oaxaca; type collected between Mitla and Oaxaca.

Brongniartia argentea Rydb. N. Amer. Fl. **24**: 195. 1923. Type from Distrito de Miahuatlán, Oaxaca.

Brongniartia hirsuta Rydb. N. Amer. Fl. **24**: 194. 1923. Querétaro, the type from Hacienda Ciervo.

Brongniartia pringlei Rydb. N. Amer. Fl. **24**: 195. 1923. Mexico, Querétaro, and Hidalgo; type from Tultenango, Mexico.

Page 470. *Cracca*. The genus has been monographed by Rydberg (N. Amer. Fl. **24**: 157-183. 1923.)

Page 473. *Cracca tepicana*. Also in Sinaloa. "Frijolillo."

Page 473. *Cracca toxicaria*. The plant described under this name is *Cracca arcuata* Rydb. N. Amer. Fl. **24**: 166. 1923. Type from María Madre Island, Tepic. *Cracca multifolia* Rose is treated by Rydberg as a distinct species, known only from Tepic.

Page 474. *Cracca schiedeana*. This name is a synonym of *Cracca toxicaria* (Swartz) Kuntze. See page 473 for synonymy.

Page 475. After *Cracca palmeri* insert:

Cracca californica Rydb. N. Amer. Fl. 24: 176. 1923. Type from Mesa Verde, Baja California.

Cracca calva Rydb. N. Amer. Fl. 24: 161. 1923. Jalisco, the type from the barranca near Guadalajara.

Cracca cathartica (Sessé & Moc.) Rydb. N. Amer. Fl. 24: 180. 1923. *Galega cathartica* Sessé & Moc. Fl. Mex. ed. 2. 175. 1894; *Cracca schottii* Vail, Bull. Torrey Club 22: 25. 1895. Yucatán. Honduras, Colombia, and West Indies; type from Porto Rico.

Cracca konzattii Rydb. N. Amer. Fl. 24: 162. 1923. Type from Las Sedas, Oaxaca.

Cracca foliolosa Rydb. N. Amer. Fl. 24: 162. 1923. Type from Culiacán, Sinaloa.

Cracca roseana Rydb. N. Amer. Fl. 24: 164. 1923. Durango and Querétaro; type from Hacienda Ciervo, Querétaro.

Cracca rusbyi Rydb. N. Amer. Fl. 24: 181. 1923. Type from Santa Catarina, Oaxaca.

Cracca thurberi (A. Gray) Rydb. N. Amer. Fl. 24: 165. 1923. *Tephrosia thurberi* A. Gray; Rydb. N. Amer. Fl. 24: 165. 1923, as synonym; *Tephrosia leucantha acuta* Jones, Contr. West. Bot. 12: 7. 1906. Chihuahua and Sonora; type from Mububi, Sonora. Arizona.

Cracca velutina Rydb. N. Amer. Fl. 24: 171. 1923. Tepic, the type from Zopilote.

The following plants, described as species of *Tephrosia*, are not transferred here to the genus *Cracca*, since it is not improbable that they may be synonymous with some of the species of *Cracca* described by Rydberg in 1923.

Tephrosia albida T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 406. 1924. Type collected between Tuxtla Gutiérrez and Jalisco, Chiapas.

Tephrosia hypoleuca Riley, Kew Bull. 1923: 339. 1923. Type from the Sierra Madre.

Tephrosia pachypoda Riley, Kew Bull. 1923: 340. 1923. Type from the Sierra Madre.

Page 475. *Robinia neomexicana*. The tree listed under this name is referred by Rydberg (N. Amer. Fl. 24: 226. 1924) to a segregate: *Robinia luxurians* (Dieck) Rydb. N. Amer. Fl. 24: 226. 1924. *R. neomexicana luxurians* Dieck; Goeze, Gard. Chron. III. 12: 669. 1892.

Page 476. *Robinia ehrenbergii* is *Gliricidia ehrenbergii* (Schlecht.) Rydb. See page 1665).

Robinia melanocarpa is *Lennea melanocarpa* (Schlecht.) Vatke. See page 1665.

Daubentonia. The synonymy of the plant described here should be placed under *Sesban longifolia* (see below). The genus *Daubentonia* is represented in Mexico by the following species:

Daubentonia drummondii Rydb. Amer. Journ. Bot. 10: 498. 1923. San Luis Potosí. Southern United States, the type from Texas.

Daubentonia virgata (Cav.) Rydb. N. Amer. Fl. 24: 208. 1924. *Aeschynomene virgata* Cav. Icon. Pl. 3: 47. 1794. This species is known only from Mexico.

Sesban. The genus has been treated by Rydberg (N. Amer. Fl. 24: 202-205. 1924).

Sesban mexicana. The proper name for the plant described here under this name is *Sesban longifolia* (Cav.) DC. The name *Sesban mexicana* is a synonym of *S. longifolia*.

Page 477. *Sesban macrocarpa*. "Curi" (Sinaloa). The plant listed under this name is *Sesban sonorae* Rydb. N. Amer. Fl. **24**: 205. 1924. The names *Aeschynomene picta* and *Sesban picta* relate to a species not known from Mexico, although they have often been applied to this Mexican species.

After *Sesban macrocarpa* insert:

Sesban bispinosa (Jacq.) Rydb. N. Amer. Fl. **24**: 203. 1924. *Aeschynomene bispinosa* Jacq. Icon. Pl. Rar. **3**: 13. 1793. Southern Mexico. West Indies and Old World trópics.

Benthamantha. The genus has been treated by Rydberg (N. Amer. Fl. **24**: 243-249. 1924), who recognizes a large number of Mexican species, most of which seem to be based upon characters of slight specific value.

After *Benthamantha mollis* insert:

Benthamantha brandegei Rydb. N. Amer. Fl. **24**: 246. 1924. Baja California and Sonora to Guerrero and Morelos; type from Cape Region mountains of Baja California. Reported also from Costa Rica.

Benthamantha chiapensis Rydb. N. Amer. Fl. **24**: 244. 1924. Type from Jalisco, Chiapas.

Benthamantha glabella (A. Gray) Rydb. N. Amer. Fl. **24**: 247. 1924. *Cracca edwardsii glabella* A. Gray, Proc. Amer. Acad. **17**: 201. 1882. Sonora and Chihuahua to Durango. Southern Arizona.

Benthamantha microphylla Rydb. N. Amer. Fl. **24**: 244. 1924. Type from Río Coajaguillo, Michoacán or Guerrero.

Benthamantha painteri Rydb. N. Amer. Fl. **24**: 246. 1924. Durango and Jalisco; type from Guadalajara, Jalisco.

Benthamantha robusta Rydb. N. Amer. Fl. **24**: 247. 1924. Type from Iguala Canyon, Guerrero.

Benthamantha trifoliolata Rydb. N. Amer. Fl. **24**: 247. 1924. Guerrero and Puebla; type from Tehuacán, Puebla.

Benthamantha wrightii Rydb. N. Amer. Fl. **24**: 246. 1924. Sonora, the type collected between San Pedro and the Sonoita. Arizona.

Before *Diphysa* insert the following genus:

COLUTIA Medic. Vorles. Churpf. Phys. Ges. **2**: 366. 1787.

1. Colutia frutescens (L.) Medic. Phil. Bot. **1**: 210. 1789.

Colutea frutescens L. Sp. Pl. **723**. 1753.

Sutherlandia frutescens R. Br. in Ait. Hort. Kew. ed. 2. **4**: 327. 1812.

A native of South Africa, a shrub or tree with handsome red flowers. It is cultivated in Mexico and in some places has become naturalized. Specimens have been reported from Hidalgo, Morelos, Zacatecas, and Coahuila.

Diphysa. The genus has been monographed by Rydberg (N. Amer. Fl. **24**: 209-215. 1924).

Diphysa racemosa. "Guiloche" (Sinaloa).

Page 479. *Diphysa occidentalis*. "Guiloche" (Sinaloa).

After *Diphysa occidentalis* insert:

Diphysa carthagenensis Jacq. Enum. Pl. Carib. **28**. 1760. Reported by Rydberg from Yucatán. Colombia and Venezuela, the type from Cartagena, Colombia.

Diphysa microphylla Rydb. N. Amer. Fl. **24**: 213. 1924. Tamaulipas and Nuevo León, the type from Victoria, Tamaulipas.

Diphysa puberulenta Rydb. N. Amer. Fl. **24**: 214. 1924. Sinaloa to Guerrero; type from Acaponeta, Tepic.

Diphysa punctata Rydb. N. Amer. Fl. **24**: 211. 1924. Type from Cuernavaca, Morelos.

Diphysa spinosa Rydb. N. Amer. Fl. **24**: 213. 1924. Yucatán and Chiapas (type from Canjob). Guatemala.

Diphysa villosa Rydb. N. Amer. Fl. **24**: 214. 1924. Type from Yautepec, Morelos.

Page 480. *Lennea robinoides*. This name is to be referred as a synonym to the following:

Lennea melanocarpa (Schlecht.) Vatke; Harms, Repert. Sp. Nov. Fedde **19**: 68. 1923. *Robinia melanocarpa* Schlecht. Linnaea **12**: 305. 1838.

Page 481. *Coursetia glandulosa*. "Chino" (Sinaloa).

Coursetia virgata, listed as a doubtful species, is *Daubentonia virgata* (see page 1663).

After *Coursetia madrensis* insert:

Coursetia seleri Harms, Repert. Sp. Nov. Fedde **19**: 14. 1923. *C. seleri caeciliae* Harms, loc. cit. Oaxaca, the type from Totolapam, Distrito de Yautepec.

Oneya tesota. "Palo tinta" (Baja California).

Page 482. *Gliricidia sepium*. "Cocoite" (Oaxaca).

Page 483. After *Gliricidia sepium* insert:

Gliricidia ehrenbergii (Schlecht.) Rydb. N. Amer. Fl. **24**: 239. 1924. *Robinia ehrenbergii* Schlecht. Linnaea **12**: 303. 1838; *Hybosema ehrenbergii* Harms, Repert. Sp. Nov. Fedde **19**: 66. 1923. Hidalgo, Oaxaca, and Chiapas; type from Grande, Hidalgo.

Page 484. *Hesperothamnus*. The genus has been monographed by Rydberg (N. Amer. Fl. **24**: 235-237. 1924).

Hesperothamnus grandis. This name is to be referred to synonymy under the following:

Hesperothamnus purpusi (Harms) Rydb. N. Amer. Fl. **24**: 236. 1924. *Sclerothamnus purpusi* Harms, Repert. Sp. Nov. Fedde **17**: 326. 1921. Type from El Riejo, Puebla.

After *Hesperothamnus grandis* insert:

Hesperothamnus pentaphyllus (Harms) Rydb. N. Amer. Fl. **24**: 236. 1924. *Sclerothamnus pentaphyllus* Harms, Repert. Sp. Nov. Fedde **17**: 325. 1921. Oaxaca and Puebla; type from Salomé, Oaxaca.

Hesperothamnus brachycalyx Rydb. N. Amer. Fl. **24**: 237. 1924. Type collected near Domingullo, Oaxaca.

Hesperothamnus ehrenbergii (Harms) Rydb. N. Amer. Fl. **24**: 237. 1924. *Sclerothamnus ehrenbergii* Harms, Repert. Sp. Nov. Fedde **17**: 326. 1921. Type from Mestitlán (Hidalgo?).

Page 487. *Meibomia cinerea*. "Pegajoso" (Sinaloa); "ramoncillo" (Nayarit).

After *Meibomia amplifolia* insert:

Meibomia bella Blake, Bot. Gaz. **78**: 282. 1924. Morelos (type from Cuernavaca) and Michoacán.

Meibomia dasyacra Blake, Bot. Gaz. **78**: 287. 1924. Type from mountains near Talpa, Jalisco.

Meibomia hemsleyana Schindler, Repert. Sp. Nov. Fedde **20**: 138. 1924. Chiapas (type locality) and Oaxaca. Guatemala.

Meibomia karwinskii Schindler, Repert. Sp. Nov. Fedde **20**: 146. 1924. Type from some unknown locality in Mexico.

Meibomia langlasseana Schindler, Repert. Sp. Nov. Fedde **20**: 147. 1924. Type from Monte de la Pasuacareta, Michoacán or Guerrero. "Escobilla."

Meibomia micheliana Schindler, Repert. Sp. Nov. Fedde **20**: 139. 1924. Type from the Sierra Madre of Michoacán or Guerrero. Guatemala.

Meibomia pulchra Schindler, Repert. Sp. Nov. Fedde 20: 145. 1924. Type from El Ocote, Michoacán or Guerrero.

Meibomia pycnantha Blake, Bot. Gaz. 78: 271. 1924. Type from Cuernavaca, Morelos; Mexico.

Meibomia sumichrastii Schindler, Repert. Sp. Nov. Fedde 20: 138. 1924. Michoacán, Guerrero, and Oaxaca.

Meibomia tephrophylla Blake, Bot. Gaz. 78: 274. 1924. Type from barranca of Guadalajara, Jalisco.

Page 494. *Canavalia*. The genus has been treated recently by Piper (Contr. U. S. Nat. Herb. 20: 555-588. 1925).

Page 495. After *Canavalia hirsuta* insert:

Canavalia palmeri (Piper) Standl. *Wenderothia palmeri* Piper, Contr. U. S. Nat. Herb. 20: 580. 1925. Michoacán to Chiapas; type from Acapulco.

Page 496. After *Eriosema pulchellum* add:

Eriosema nigropunctatum T. S. Brandeg. Univ. Calif. Publ. Bot. 7: 327. 1920. Type from Palmilla, near Zacuapan, Veracruz.

Page 497. *Dolicholus longeracemosus*. "Piule" (Oaxaca).

Page 501. *Erythrina americana*. "Pipal," "tzompanquanitl" (Chiapas).

Page 506. *Andira jamaicensis*. Omit *A. jamaicensis* and *Geoffraea jamaicensis*. The proper name for the species is *Andira inermis* (Swartz) H. B. K. "Cuartololoti" (Guerrero).

Amerimnon. See Pittier, On the species of *Dalbergia* of Mexico and Central America, Journ. Washington Acad. Sci. 12: 54-64. 1922.

Page 507. *Amerimnon granadillo*. A synonym is *Dalbergia granadillo* Pittier, Journ. Washington Acad. Sci. 12: 62. 1922.

Page 508. Before *Pterocarpus* insert:

Amerimnon cibix (Pittier) Standl. *Dalbergia cibix* Pittier, Journ. Washington Acad. Sci. 12: 59. 1922. Type from Yaxcaba, Yucatán. "Cibix," "kuxubtooch" (Maya).

Amerimnon congestiflorum (Pittier) Standl. *Dalbergia congestiflora* Pittier, Journ. Washington Acad. Sci. 12: 57. 1922. Type from Cuernavaca, Morelos.

Amerimnon mexicanum (Pittier) Standl. *Dalbergia mexicana* Pittier, Journ. Washington Acad. Sci. 12: 59. 1922. Type from Mexico, the locality not known.

Amerimnon tabascanum (Pittier) Standl. *Dalbergia tabascana* Pittier, Journ. Washington Acad. Sci. 12: 58. 1922. Type from Mayito, Tabasco.

Page 508. *Pterocarpus acapulcensis*. "Granadillo," "palo de rosa" (Guerrero).

Page 509. *Machaerium*. The genus has been treated by Pittier (Contr. U. S. Nat. Herb. 20: 467-477. 1922).

Machaerium bioulatum. A synonym is *Machaerium langlassei* Micheli; Pittier, Contr. U. S. Nat. Herb. 20: 473. 1922. The species occurs in Nayarit, where it is called "cuamecate prieto."

Page 510. After *Machaerium riparium* insert:

Machaerium acanthothyrsus Pittier, Contr. U. S. Nat. Herb. 20: 473. 1922. Type collected between Hacienda del Capricho, Guerrero, and Llano Grande, Oaxaca.

Machaerium chiapense T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 405. 1924. Type collected between Tuxtla Gutiérrez and Jalisco, Chiapas.

Machaerium marginatum Standl. Journ. Washington Acad. Sci. 14: 95. 1924. Oaxaca. El Salvador (type from San Vicente) and Panama. "Uña de gato" (Oaxaca); "sangre bravo" (El Salvador).

Machaerium setulosum Pittier, Contr. U. S. Nat. Herb. 20: 477. 1922. Veraacruz, the type from Zacuapan. Guatemala.

Page 511. *Ichthyomethia americana*. "Alejo" (Guerrero).

Page 513. *Lonchocarpus megalanthus*. "Jumay" (Sinaloa).

Lonchocarpus lanceolatus. "Talistillo" (Sinaloa).

Page 515. *Lonchocarpus eriocarinalis*. "Margarita" (Colima). Leaves said to be employed as a remedy for fevers.

After *Lonchocarpus jaliscensis* insert:

Lonchocarpus argyrotichus Harms, Repert. Sp. Nov. Fedde 17: 320. 1921. Type from Taxmalac, Distrito de Hidalgo, Guerrero.

Lonchocarpus dumetorum T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 181. 1922. Type from Remudadero, Veraacruz.

Lonchocarpus fuscopurpureus T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 405. 1924. Type from Remudadero, Veraacruz.

Lonchocarpus galeottianus Harms, Repert. Sp. Nov. Fedde 17: 322. 1921. Type from Hacienda de la Concepción, Oaxaca.

Lonchocarpus kerberi Harms, Repert. Sp. Nov. Fedde 17: 322. 1921. Type from Volcán de Colima.

Lonchocarpus malacotrichus Harms, Repert. Sp. Nov. Fedde 17: 323. 1921. Type from some unknown locality in Mexico.

Lonchocarpus seleri Harms, Repert. Sp. Nov. Fedde 17: 324. 1921. Type from Rincón de los Tenates, Distrito de Tuxtla, Veraacruz.

Lonchocarpus schiedeana (Schlecht.) Harms, Repert. Sp. Nov. Fedde 17: 324. 1921. *Robinia schiedeana* Schlecht. Linnaea 12: 306. 1838. Type collected between Veraacruz and Santa Fe.

Lonchocarpus stenodon Harms, Repert. Sp. Nov. Fedde 17: 324. 1921. Type from Pinotepa, Chinantla, Oaxaca.

ZYGOPHYLLACEAE.

Page 521. After *Fagonia rosei* insert:

Fagonia densa I. M. Johnston, Proc. Calif. Acad. IV. 12: 1052. 1924. Type from South San Lorenzo Island, Gulf of California.

Page 524. *Viscainoa geniculata*. To the synonymy add: *Viscainoa geniculata pinnata* I. M. Johnston, Univ. Calif. Publ. Bot. 7: 439. 1922.

RUTACEAE.

Page 527. *Casimiroa watsonii*. Also in Sinaloa, where it is called "zapote."

Page 530. After *Amyris thyrsoflora* insert:

Amyris konzattii Standl. Journ. Washington Acad. Sci. 13: 6. 1923. Type from Los Sabinos, between Juchatengo and Santa Ana, Oaxaca.

Page 535. After *Zanthoxylum microcarpum* insert:

Zanthoxylum tenuipes Standl. Journ. Washington Acad. Sci. 16: 15. 1926. Mountains east of Monserrate, Chiapas.

Page 536. Under No. 5, for "*Zanthoxylum fagara*" etc., read: **Esenbeckia pentaphylla** (Macfad.) Griseb. Fl. Brit. W. Ind. 135. 1859.

SIMAROUBACEAE.

Page 542. Before Burseraceae insert the following genus of Simaroubaceae:

PICRASMA Blume, Bijdr. Fl. Ned. Ind. 247. 1825.

1. **Picrasma mexicana** T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 410. 1924. Type from Remudadero, Veraacruz. Not seen by the writer.

BURSERACEAE.

Page 548. *Elaphrium bipinnatum*. "Copal de la Virgen" (Sinaloa). To the synonymy add: *Bursera stenophylla* Sprague & Riley, Kew Bull. 1923: 169. 1923.

Page 549. *Elaphrium odoratum*. To the synonymy add: *Bursera lonchophylla* Sprague & Riley, Kew Bull. 1923: 168. 1923.

Elaphrium penicillatum. "Copal" (Sinaloa).

Page 552. *Elaphrium excelsum*. To the synonymy add: *Bursera acutidens* Sprague & Riley, Kew Bull. 1923: 169. 1923; *Bursera sphaerocarpa* Sprague & Riley, op. cit. 170. 1923.

MELIACEAE.

Page 554. *Trichilia*. In the generic description, for "Leaves abruptly pinnate, rarely odd-pinnate," read "Leaves odd-pinnate, rarely abruptly pinnate." *Trichilia havanensis*. "Zapotillo" (Tamaulipas).

Page 555. *Trichilia hirta*. "Jumay," "palo colorado chico," "azuica" (Sinaloa).

Page 560. *Swietenia humilis*. "Palo zopilote" (Oaxaca).

MALPIGHIACEAE.

Page 568. After *Bunchosia gracilis* add:

Bunchosia monticola T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 410. 1924. Type from Hacienda Montserrate, Chiapas.

Page 572. *Tetrapteris mexicana*. "Bejuco hueso" (Sinaloa).

After *Hiraea velutina* add:

Hiraea obovata Niedenzu, *Hiraea* 7. 1906. *Hiraea purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 184. 1922. Veracruz. Central America, the type from Costa Rica.

Hiraea polycarpa (T. S. Brandeg.) Standl. *Mascagnia polycarpa* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 409. 1924. Type from Remudadero, Veracruz; also in Oaxaca.

Page 576. *Banisteria laurifolia*. "Compio" (Nayarit).

Page 577. *Banisteria pallida*. To the synonymy add: *Banisteria nemorum* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 410. 1924.

Page 578. Before Polygalaceae insert the following family:

VOCHYACEAE. Vochya Family.

1. **VOCHYA** Aubl. Pl. Guian. 18. 1775.

1. ***Vochya tabascana*** (Sprague) Standl. N. Amer. Fl. 25: 302. 1924.

Vochisia parviflora Villada, *Naturaleza* II. 3: 681. 1903. Not *V. parviflora* Spruce, 1875.

Vochisia tabascana Sprague, Kew Bull. 1922: 183. 1922.

Type collected between Atasta and La Tejería, Tabasco.

POLYGALACEAE.

Page 588. *Polygala appressipilis*. A synonym of this is *Polygala sinaloensis* Riley, Kew Bull. 1923: 108. 1923.

Page 594. *Securidaca diversifolia*. "Cuaumecate frijolillo" (Nayarit).

EUPHORBIACEAE.

Page 601. *Euphorbia californica*. "Zipehui" (Sinaloa).

Page 602. *Euphorbia schlechtendalii*. "Tencuanete" (Sinaloa).

Page 604. *Euphorbia plicata*. "Jumete," "candelilla de palo" (Sinaloa).

Page 607. After *Pedilanthus rubescens* add:

Pedilanthus petraeus T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 411. 1924. Type from the State of Veracruz.

Page 610. *Phyllanthus acuminatus*. This name and its synonym should be placed in synonymy under the following, the proper name for the species: **Phyllanthus conami** Swartz, Prodr. Veg. Ind. Occ. 28. 1788.

Page 610. After *Astrocasia phyllanthoides* insert:

Astrocasia populifolia I. M. Johnston, Contr. Gray Herb. n. ser. 68: 84. 1923. This was based on the same collections as *Jatropha cercidiphylla* Standl. (Contr. U. S. Nat. Herb. 23: 639. 1923). The latter name has priority of publication. The plant can scarcely be a species of *Jatropha*, but its reference to *Astrocasia* is equally doubtful, and it seems probable, as suggested by Johnston, that it may represent a distinct and new genus.

Page 613. *Croton glabellus*. This has been collected also in the State of Nayarit.

Page 617. *Croton ciliato-glandulosus*. "Trucha" (Sinaloa).

Page 620. *Croton morifolius*. "Ocotillo," "vara blanca" (Sinaloa).

After *Croton morifolius* insert:

Croton sitiens T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 185. 1922. Type from Remudadero, Veracruz.

Page 624. *Acalypha*. The genus has been monographed by Pax and Hoffmann (in Engl. Pflanzenreich IV. 147. xvi).

Page 627. *Acalypha schlechtendaliana*. A synonym is *Acalypha filiformis* Schlecht. Linnaea 19: 235. 1847. Not *A. filiformis* Bojer, 1837.

Page 628. *Acalypha arvensis*. This name should be omitted, since it relates to an annual species. The proper name for the plant described is *A. capitellata* T. S. Brandeg., a species endemic in Mexico.

Acalypha seleriana. Reported by Pax also from Veracruz.

Acalypha unibracteata. Place as a synonym, *A. unibracteata heterantha* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 411. 1924.

Page 630. *Acalypha adenostachya*. The proper name for the plant described is *Acalypha subviscida* S. Wats. The entry for *A. adenostachya*, a distinct species, should be as follows:

Acalypha adenostachya Muell. Arg. Linnaea 34: 21. 1865. Described from southern Mexico.

Page 631. Under No. 40, for "*Acalypha liebmanni*" read "*Acalypha liebmanniana*."

Acalypha schiedeana. Reported by Pax also from Tamaulipas.

Page 632. After *Acalypha frederici* insert:

Acalypha chiapensis T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 411. 1924. Type collected between Tuxtla Gutiérrez and Jalisco, Chiapas.

Acalypha cinerea Pax & Hoffm. in Engl. Pflanzenreich IV. 147 xvi: 102. 1924. Type from some unknown locality in central Mexico.

Acalypha confertiflora Pax & Hoffm. in Engl. Pflanzenreich IV. 147 xvi: 53. 1924. Type from Tomellín Canyon, Oaxaca.

Acalypha gaumeri Pax & Hoffm. in Engl. Pflanzenreich IV. 147 xvi: 173. 1924. Type from Izamal, Yucatán.

Acalypha glandulosa Cav. Anal. Hist. Nat. Madrid 2: 141. 1801. Type from Salvatierra, Guanajuato.

Acalypha grisea Pax & Hoffm. in Engl. Pflanzenreich IV. 147 xvi: 56. 1924. Type from San Marcos, Jalisco.

Acalypha microcephala Muell. Arg. Linnaea 34: 160. 1865. Type from Oaxaca.

Acalypha oreopola Greenm. Proc. Amer. Acad. 39: 82. 1903. Type from Iguala, Guerrero.

- Acalypha palmieri* Pax & Hoffm. in Engl. Pflanzenreich IV. 147 xvi: 157. 1924. Colima (type from Manzanillo), Michoacán, and Guerrero.
- Acalypha rubroserrata* Pax & Hoffm. in Engl. Pflanzenreich IV. 147 xvi: 28. 1924. Puebla and Tlaxcala; type from Puebla.
- Acalypha synoica* Pax & Hoffm. in Engl. Pflanzenreich IV. 147 xvi: 156. 1924. Type from Tehuacán, Puebla.
- Acalypha tricholoba* Muell. Arg. *Linnaea* 34: 16. 1865. Type from Mexico. Guatemala.
- Page 632. *Bernardia fasciculata*. This is *Halliophytum fasciculatum* I. M. Johnston; see below.
- Page 633. Before *Adelia* insert the following genus:
- HALLIOPHYTUM** I. M. Johnston, Contr. Gray Herb. n. ser. 68: 88. 1923.
- One other species is known from southern California.
- Halliophytum fasciculatum* (S. Wats.) I. M. Johnston, Contr. Gray Herb. n. ser. 68: 88. 1923. *Bernardia fasciculata* S. Wats. Proc. Amer. Acad. 18: 153. 1883. See page 632.
- Halliophytum capense* I. M. Johnston, Contr. Gray Herb. n. ser. 68: 89. 1923. *Securinea capensis* I. M. Johnston, Univ. Calif. Publ. Bot. 7: 441. 1922. Type from coast below Pescadero, Baja California.
- After *Adelia oaxacana* add:
- Adelia virgata* T. S. Brandeg. *Zoe* 4: 406. 1894. Baja California and Sonora; type from Sierra de la Laguna, Baja California.
- Page 636. *Jatropha angustidens*. "Quemador," "tachinole," "copal," "chilte" (Sinaloa).
- Page 637. *Jatropha purpurea*. "Sangragado" (Sinaloa).
- Page 638. *Jatropha cordata*. "Torote," "zapo," "copalillo" (Sinaloa).
Jatropha cinerea. "Zapo" (Sinaloa).
- Page 639. *Jatropha cercidiphylla*. A synonym of this is *Astrocasia populifolia* I. M. Johnston; see page 1669.
- Jatropha platyphylla*. "Bonete," "boneto" (Sinaloa).
- Page 642. After *Jatropha pseudocurcas* insert:
- Jatropha grandifrons* I. M. Johnston, Contr. Gray Herb. n. ser. 68: 89. 1923. Type from the vicinity of Oaxaca.
- Jatropha harmsiana* Mattfeld, Repert. Sp. Nov. Fedde 19: 120. 1923. Type from "Telmacan" (Tehuacán?), Mexico.
- Jatropha inermiflora* (I. M. Johnston) Standl. *Cnidoscolus inermiflorus* I. M. Johnston, Contr. Gray Herb. n. ser. 68: 85. 1923. Type collected between Victoria and Jaumave Valley, Tamaulipas.
- Jatropha malacophylla* Standl. Proc. Biol. Soc. Washington 37: 45. 1924. Type from El Zapote, Mazatlán, Sinaloa.
- Jatropha pringlei* (I. M. Johnston) Standl. *Cnidoscolus pringlei* I. M. Johnston, Contr. Gray, Herb. n. ser. 68: 85. 1923. Type from barranca near Guadalajara, Jalisco.
- Page 645. After *Manihot aesculifolia* insert:
- Manihot mexicana* I. M. Johnston, Contr. Gray Herb. n. ser. 68: 90. 1923. Type from Zapotlán, Jalisco.
- Manihot rubricaulis* I. M. Johnston, Contr. Gray Herb. n. ser. 68: 90. 1923. Type from Iron Mountain, near Durango.
- Page 652. As a synonym of *Sapium biloculare*, insert the following: *Sapium biloculare amplum* I. M. Johnston, Proc. Calif. Acad. IV. 12: 1077. 1924. Type from Loreto, Baja California.

Sapium pedicellatum. "Hiza" (Sinaloa).

Page 653. Before Buxaceae insert the following genera of Euphorbiaceae:

DRYPETES Vahl, *Eclog. Amer.* 3: 49. 1807.

1. *Drypetes lateriflora* (Swartz) Krug & Urb. *Bot. Jahrb. Engler* 15: 357. 1892.

Schaefferia lateriflora Swartz, *Prodr. Veg. Ind. Oce.* 38. 1788.

Drypetes crocea Poit. *Mém. Mus. Hist. Nat.* 1: 159. 1815.

Forchammeria lanceolata Standl. *Contr. U. S. Nat. Herb.* 20: 183. 1919.

San Luis Potosí. West Indies, southern Florida, and Central America. Known in El Salvador as "mula."

OPHELLANTHA Standl. *Journ. Washington Acad. Sci.* 14: 97. 1924.

1. *Ophellantha spinosa* Standl. *Journ. Washington Acad. Sci.* 14: 98. 1924. Oaxaca. El Salvador, the type from Izaleco.

BUXACEAE.

Page 654. *Simmondsia californica*. This name and its synonyms are to be placed in synonymy under the following:

Simmondsia chinensis (Link) Schneider, *Ill. Handb. Laubh.* 2: 141. 1907. *Buxus chinensis* Link, *Enum. Pl.* 2: 386. 1822. The locality was given originally with doubt as China, but the specimens were probably from southern California.

ANACARDIACEAE.

Page 656. *Spondias mombin*. The proper name for this species is *Spondias purpurea* L. *Spondias mombin* is the oldest name for No. 2, *S. lutea*.

Page 657. *Spondias lutea*. This name is a synonym of *Spondias mombin* L., the oldest name for the species. The tree occurs in Nayarit, where it is known as "obo."

Page 662. After *Astronium konzattii* add:

Astronium fraxinifolium Schott; Spreng. *Syst. Veg. Cur. Post.* 404. 1827. Veracruz. Brazil. A large tree. In Brazil it is highly esteemed for its lumber.

Astronium graveolens Jacq. *Enum. Pl. Carib.* 33. 1760. Guerrero, Oaxaca, and Yucatán. Central America, Colombia, and Venezuela. "Palo de cera," "palo de culebra" (Guerrero); "copaiva" (Oaxaca); "ronrón" (El Salvador, Honduras); "palo obero" (Honduras); "gateado" (Venezuela); "diomate," "yomate," "gusanero," "tibigaro," "marfil vegetal" (Colombia). This, also, is a large tree. The wood is valued highly throughout the range because of its durability and its suitability for cabinetwork. *Astronium konzattii* may not be specifically distinct from *A. graveolens*.

Page 663. *Comocladia mollissima*. It is probable that the following is a synonym of this species: *Comocladia macrophylla* (Hook. & Arn.) Riley, *Kew Bull.* 1923: 175. 1923. *Rhus macrophylla* Hook. & Arn. *Bot. Beechey Voy.* 2: 213. 1840-41. Type from Acapulco.

Page 671. *Rhus terebinthifolia*. "Paguay" (Sinaloa).

CELASTRACEAE.

Page 682. After *Schaefferia stenophylla* add:

Schaefferia oaxacana Standl. *Journ. Washington Acad. Sci.* 13: 7. 1923. Type from Cumbre de las Calaveras, Distrito de Zimatlán, Oaxaca.

HIPPOCRATEACEAE.

Page 686. *Hippocratea acapulcensis*. "Chile de perro" (Sinaloa).

ICACINACEAE.

Page 689. *Calatola laevigata*. "Calate," "calatole" (Oaxaca; from cal-atl-cacalotl=crow-water, *Reko*). The nut is said to impart a black color to water.

SAPINDACEAE.

Page 698. *Serjania californica*. This has been transferred by Johnston to the genus *Paullinia* (*Paullinia californica* I. M. Johnston, Proc. Calif. Acad. IV. 12: 1084. 1924), but the fruit of the plant is unknown and its generic position therefore still uncertain.

Page 699. After *Serjania pacifica* insert:

Serjania ochroclada Radlk. Repert. Sp. Nov. Fedde 17: 357. 1921. Type from Río Santa Lucía, Sierra de Misteca, Puebla.

Serjania unguiculata Radlk. Repert. Sp. Nov. Fedde 17: 359. 1921. Type from Monte Albán, Oaxaca.

Page 699. *Urvillea ulmacea*. "Hiedra" (Veracruz, *Endlich*).

Page 700. *Cardiospermum spinosum*. This has been transferred by Johnston to the genus *Paullinia*; see below.

After *Cardiospermum dissectum* add:

Cardiospermum pygmaeum Radlk. Repert. Sp. Nov. Fedde 17: 361. 1921. Type from Cerro de Santa Lucía, Puebla.

Page 702. *Paullinia fuscescens*. "Pico de guiloche" (Sinaloa).

Page 703. *Paullinia pinnata*. "Cuamecate" (Nayarit).

Paullinia tomentosa. "Ojillo" (Veracruz). *Endlich* reports that the seeds are used as eyes for dolls.

After *Paullinia sonorensis* add:

Paullinia californica (Radlk.) I. M. Johnston, Proc. Calif. Acad. IV. 12: 1084. 1924. See above, and also page 698.

Paullinia spinosa (Radlk.) I. M. Johnston, Proc. Calif. Acad. IV. 12: 1083. 1924. *Cardiospermum spinosum* Radlk. See above and also page 700.

Page 708. *Thouinidium decandrum*. A synonym is *Thouinidium riparium* Radlk. Repert. Sp. Nov. Fedde 17: 363. 1921. "Perico," "cola de perico," "cabo de hacha" (Sinaloa).

Thouinidium insigne. The entry should read: ***Thouinidium insigne*** Radlk. Repert. Sp. Nov. Fedde 17: 363. 1921.

RHAMNACEAE.

Page 712. *Gouania mexicana*. "Guirote de palo" (Sinaloa).

Page 713. *Zizyphus sonorensis*. "Naranjillo" (Tamaulipas); "brasilillo," "confite," "ceituna" (Sinaloa). The species occurs also in Tamaulipas.

Page 714. *Condalia parryi*. To the synonymy add *Condalia parryi microphylla* I. M. Johnston, Univ. Calif. Publ. Bot. 7: 439. 1922. Baja California, the type from Las Huevitas.

Page 715. After *Condalia lycioides* insert:

Condalia globosa I. M. Johnston, Proc. Calif. Acad. IV. 12: 1086. 1924. *C. globosa pubescens* I. M. Johnston, op. cit. 1087. 1924. Baja California, the type from La Paz.

Page 716. *Karwinskia mollis*. "Capulincillo" (Tamaulipas). Collected also in Tamaulipas.

Page 718. *Cormonema*. Recent study has convinced the writer that this genus does not differ in any constant respect from *Colubrina*. The nomenclature of the two species listed here should be changed, as follows:

Colubrina tepicana Standl. *Cormonema mexicana* Rose, Contr. U. S. Nat. Herb. 3: 315. 1895. Not *Colubrina mexicana* Rose, 1895.

Colubrina heteroneura (Griseb.) Standl. Journ. Washington Acad. Sci. 15: 285. 1925. *Zizyphus heteroneurus* Griseb. Bonplandia 1858: 3. 1858; *Rhamnus biglandulosa* Sessé & Moc. Pl. Nov. Hisp. 38. 1887; *Cormonema nelsoni* Rose, Contr. U. S. Nat. Herb. 3: 315. 1895; *Cormonema biglandulosa* Standl. Contr. U. S. Nat. Herb. 23: 718. 1923; *Rhamnus gonzalezii* Riley, Kew Bull. 1923: 173. 1923; *Cormonema multiflora* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 411. 1924. Sinaloa to Guerrero and Veracruz. Central America, the type from Panama. "Brasilillo," "aleznila" (Sinaloa).

Page 719. *Colubrina glomerata*. "Guacimilla" (Sinaloa).

Page 720. *Colubrina greggii*. "Trompillo" (Puebla).

After *Colubrina greggii* insert:

Colubrina californica I. M. Johnston, Proc. Calif. Acad. IV. 12: 1085. 1924. Baja California, the type from Las Animas Bay.

Page 727. After *Rhamnus mucronata* add:

Rhamnus dianthes Riley, Kew Bull. 1923: 172. 1923. Type from the Sierra Madre.

VITACEAE.

Page 730. Before *Cissus* insert:

Vitis girdiana Munson, U. S. Dept. Agr. Div. Pomol. Bull. 3: 10. 1890. Baja California. Southern California.

Page 733. *Cissus rhombifolia*. "Tripas de zopilote" (Sinaloa).

ELAEOCARPACEAE.

Page 734. After *Sloanea mexicana* insert:

Sloanea quadrivalvis Seem. Bot. Voy. Herald 85. pl. 15. 1853. Nayarit. Central America; type from Veraguas, Panama. "Huesillo" (Nayarit); "terciopelo" (Panama, Costa Rica, El Salvador); "casaco" (Panama).

TILIACEAE.

Page 737. *Belotia*. The genus has been monographed by Sprague (Kew Bull. 1921: 270-278. 1921). The species occurring in Mexico are the following:

Belotia insignis Baill. Adansonia 10: 182. 1872. Tepic to Oaxaca and Veracruz. This is the plant described on page 737 under the name *Belotia mexicana*.

Belotia grandifolia Sprague, Kew Bull. 1921: 275. 1921. Veracruz; type from Zacuapan.

Belotia mexicana (DC.) K. Schum. in Engl. & Prantl, Pflanzenfam. 3^o: 28. 1890. *Grewia mexicana* DC. Prodr. 1: 510. 1824. *Belotia galeottii* Turcz. Bull. Soc. Nat. Moscou 19: 504. 1846. Veracruz and Oaxaca. Guatemala. This is the plant described on page 737 under the name *Belotia grewiaefolia*. That name pertains to a Cuban plant and should be excluded from the Mexican flora.

Belotia tabascana Sprague, Kew Bull. 1921: 278. 1921. Type from Lomas de San Sebastián, Tabasco. Called "palencano." One collection from Oaxaca is probably referable to this species, although it seems scarcely separable from the common *B. campbellii* of Guatemala and British Honduras.

Page 738. *Apeiba tibourbou*. "Pachioté" (Oaxaca).

Helioarpus. The genus has been treated by E. E. Watson (Bull. Torrey Club 50: 109-128. 1923).

Page 740. *Helioarpus tomentosus*. This is a synonym of the following: **Helioarpus americanus** L. Sp. Pl. 448. 1753. Type from Veracruz. See Sprague, Journ. Bot. Brit. & For. 61: 255. 1923.

Helioarpus tigrinus. This is a species of *Triumfetta*; see below.

Helioarpus glabrescens. This name is a synonym of the following: **Helioarpus mexicanus** (Turcz.) Sprague, Kew Bull. 1921: 272. 1921; *Adenodiscus mexicanus* Turcz. Bull. Soc. Nat. Moscou 19^o: 504. 1846; *Triumfetta mexicana*

Turez. Bull. Soc. Nat. Moscou 31: 230. 1858. Type from the mountains of Oaxaca.

Page 741. After *Heliocarpus palmeri* insert:

Heliocarpus viridis E. E. Wats. Bull. Torrey Club 50: 120. 1923. Type from Sonora.

Page 745. *Triumfetta mexicana*. This name refers to a species of *Heliocarpus*; see above.

Page 746. After *Triumfetta discolor* insert:

Triumfetta dioica T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 412. 1924. Type from Hacienda Montserrat, Chiapas.

Triumfetta sanctae-luciae Sprague, Kew Bull. 1923: 114. 1923. Type from Santa Lucia, Sinaloa.

Triumfetta tigrina (Hochr.) Standl. *Heliocarpus tigrinus* Hochr. Ann. Cons. Jard. Genève 18-19: 123. 1914. Type from Moreno, Michoacán. The position of this species is doubtful because of the lack of fruit, but the combination of flower and foliage characters distinguish it from other Mexican species of *Triumfetta*.

MALVACEAE.

Page 751. *Abutilon percaudatum*. The entry for this species should read: *Abutilon percaudatum* Hochr. Ann. Cons. Jard. Genève 21: 439. 1920.

Page 752. *Abutilon glabriflorum*. The entry should read: *Abutilon glabriflorum* Hochr. Ann. Cons. Jard. Genève 21: 439. 1920.

Abutilon sphaerostaminum. The entry should read: *Abutilon sphaerostaminum* Hochr. Ann. Cons. Jard. Genève 21: 441. 1920.

Page 754. *Abutilon membranaceum*. "Colotague" (Sinaloa).

Page 755. After *Abutilon dentatum* insert:

Abutilon mochisense Hochr. Ann. Cons. Jard. Genève 21: 447. 1920. Type from Las Mochis, Sinaloa.

Abutilon subsagittatum Hochr. Ann. Cons. Jard. Genève 21: 444. 1920. Type from Victoria, Tamaulipas.

Abutilon tultitlanapense Hochr. Ann. Cons. Jard. Genève 21: 443. 1920. Type from San Luis Tultitlanapa, Puebla.

Page 761. *Robinsonella cordata*. "Jonote," "nojonote" (Puebla).

After *Robinsonella cordata* insert:

Robinsonella subcordata Hochr. Ann. Cons. Jard. Genève 21: 449. 1920. Type from Oaxaca.

Page 770. After *Malvastrum ribifolium* insert:

Malvastrum foliosum S. Wats. Proc. Amer. Acad. 20: 356. 1885. Baja California, the type from Santo Tomás. A low shrub.

Page 772. After *Malache purpusii* insert:

Malache ortegiana Standl. Proc. Biol. Soc. Washington 37: 46. 1924. Type from Nayarit.

Page 775. *Malvaviscus arboreus*. "Obelisco de la sierra," "quesito" (Sinaloa).

Page 781. *Hibiscus biseptus*. "Malvita" (Sinaloa).

BOMBACACEAE.

Page 786. Bombacaceae. No specimens of *Ochroma* from Mexico have been seen by the writer, but *O. lagopus* Swartz (= *O. pyramidale* (Cav.) Urban) has been reported from Tabasco. This species is a West Indian one, but it seems probable that one of those described recently by Rowlee occurs in southern Mexico. The vernacular names "jopi," "jubiguy," and "pomoy" are reported from Tabasco. The trees of this genus furnish the balsa wood of commerce, one of the lightest woods known.

STERCULIACEAE.

- Page 798. *Helicteres baruensis*. Also in Sinaloa, where it is called "chico."
 Page 800. *Waltheria acuminata*. "Guacimilla" (Sinaloa).
 Page 801. *Waltheria americana*. "Hierba del pasmo" (Sinaloa).
 Page 802. *Physodium corymbosum acuminatum*. "Sapo," "papasolte," "algodoncillo" (Sinaloa).
 Page 809. *Guazuma ulmifolia*. "Guacimilla" (Sinaloa).
 Page 811. *Ayenia pusilla*. "Hierba del cáncer" (Sinaloa).
 Page 813. *Buettneria catalpifolia*. Also in Sinaloa, where it is called "bejuco chino."

DILLENACEAE.

- Page 819. *Curatella americana*. "Rasca la vieja" (Nayarit).
 After *Curatella* insert:

DOLOIACARPUS Roland, Vet. Akad. Handl. Stockholm 17: 256, hyponym. 1756; Gmel. Syst. Veg. 805. 1796.

1. **Doloiocarpus oaxacanus** Szysz. Diss. Math-nat. Acad. Litt. Cracov. 27: 139. 1894.

Described from Oaxaca.

OCHNACEAE.

Page 819. *Ouratea*. The genus has been treated by Riley (Kew Bull. 1924: 101-111. 1924).

Ouratea mexicana. This name belongs to the plant described as *O. pallida* (p. 820); see below. The proper name for the plant described here as *O. mexicana* is *Ouratea jurgensenii* (Planch.) Engl. The type was collected in the Sierra San Pedro Nolasco, Oaxaca.

Page 820. *Ouratea pallida*. According to Riley, the proper name for the shrub described under this name is *Ouratea mexicana* (H. B. K.) Engl. (see p. 819 or citations).

After *Ouratea pallida* insert:

Ouratea globosa Engl. in Mart. Fl. Bras. 12²: 323. 1876. Type from "Lizando."

Ouratea pyramidalis Riley, Kew Bull. 1924: 107. 1924. Type from Atasta, Tabasco. Guatemala.

Ouratea oblita Riley, Kew Bull. 1924: 108. 1924. Type said to have been collected in Mexico by Sessé and Mocino.

Ouratea theophrasta (Planch.) Baill. Hist. Pl. 4: 359. 1873. *Gomphia theophrasta* Planch. in Linden, Cat. 8. 1859. *Wolkensteinia theophrasta* Regel, Gartenflora 14: 131. pl. 471. 1865. Described from Tabasco.

CLUSIACEAE.

Page 826. *Calophyllum rekoii*. A tree perhaps of this species grows in Tepic, where it is called "palo María." In El Salvador the species is known as "barillo," "marfo," and "varillo."

FOUQUIERIACEAE.

- Page 830. *Fouquieria formosa*. "Tlapacón" (Puebla).

CISTACEAE.

Page 833. *Halimium exaltatum*. A synonym is *Halimium discolor* Riley, Kew Bull. 1923: 107. 1923.

COCHLOSPERMACEAE.

Page 836. *Maximiliana vitifolia*. Among the vernacular names, for "poró-poró" read "poro-poro." "Rosa amarilla" (Sinaloa).

FLACOURTIACEAE.

Page 841. *Myroxylon velutinum*. "Junco" (Sinaloa). The citation for the synonym *Xylosma velutinum* should read: Triana & Planch. Prodr. Fl. Novogran. 97. 1862.

Page 846. *Casearia dolichophylla*. "Garrapatilla" (Nayarit).

TURNERACEAE.

Page 847. *Erblichia odorata*. "Suelda con suelda" (Nayarit).

LOASACEAE.

Page 854. *Mentzelia konzattii*. "Yaga-duchi" (Oaxaca, Zapotec, Reko).

Page 855. After *Petalonyx linearis* insert the following genus:

EUCNIDE Zucc. Del. Sem. Hort. Monac. 28. 1844.

1. **Eucnide cordata** Kell.; Curran, Bull. Calif. Acad. 1: 137. 1885.

Baja California, the type from Cedros Island. A low shrub,

CACTACEAE.

Page 862. After *Peresklopsis aquosa* add:

Peresklopsis scandens Britt. & Rose, Caetaceae 4: 252. 1924. Yucatán, the type from Mérida.

Page 889. After *Opuntia chaffeyi* add:

Opuntia arenaria Engelm. Proc. Amer. Acad. 3: 301. 1856. Northern Mexico near the United States boundary. Also in western Texas and southern New Mexico.

Opuntia alamosensis Britt. & Rose, sp. nov.

Shrub 1 meter high or so, very much branched above; joints bright green; tubercles prominent, elongate; areoles circular, brown-felted; spines on young branches 3 or more, long-acicular, up to 4 cm. long, brown, covered with a loose papery sheath; glochids numerous, whitish to brown; flowers yellow, 3 to 4 cm. long, including the ovary; ovary strongly tubercled; areoles subtended by small ovate leaves and often bearing 1 slender spine or more, 2.5 cm. long; fruit not seen.

Type collected by J. G. Ortega near La Cruz, Sinaloa, Mexico, in 1924 (no. 5235; U. S. Nat. Herb. no. 1,209,382).

This seems to be the same as the plant obtained by Rose near Alamos, Sonora, in 1910, which is referred to under *O. kleiniae* in the Caetaceae (1: 51). It differs from that species in its more spiny branches and yellow flowers.

Opuntia feroacantha Britt. & Rose, sp. nov.

Bushy shrub with large joints and very formidable spines, glabrous throughout; joints oblong to obovate, 1.5 to 2.5 cm. long, more or less cuneate at base; areoles rather few, 2 to 4 cm. apart, rather large, circular, brown-felted; glochids yellow, numerous; spines usually 1 or 2, sometimes a third or even a fourth one but these shorter, the longest one sometimes 8 cm. long or even longer, dull white or becoming brownish at base in age, very stout, often twisted; flowers small, rotate, about 4 cm. broad; petals yellow, 1.5 cm. long; filaments very short; stigma lobes about 7.

Type from Sinaloa (J. G. Ortega 5228; U. S. Nat. Herb. no. 1,209,383). Also collected at Acaponeta, Tepic, Rose, Standley & Russell 1447.

Page 893. After *Cephalocereus purpusii* add:

Cephalocereus collinsii Britt. & Rose, *Cactaceae* 4: 269. 1923. Oaxaca, the type from Gerónimo.

Page 901. After *Lemaireocereus dumortieri* add:

Lemaireocereus beneckeii (Ehrenb.) Britt. & Rose, *Cactaceae* 4: 273. 1923. *Cereus beneckeii* Ehrenb. Bot. Zeit. 2: 835. 1844; *Cereus farinosus* Haage in Salm-Dyck, Allg. Gartenzeit. 13: 355. 1845; *Piptanthocereus beneckeii* Riccobono, Boll. Ort. Bot. Palermo 8: 226. 1909. Central Mexico.

Page 916. After *Selenicereus spinulosus* insert:

Selenicereus nelsonii (Weingart) Britt. & Rose, *Cactaceae* 4: 283. 1923. *Cereus nelsonii* Weingart, Zeitschr. Sukkulent. 1: 33. 1923. Southern Mexico.

Page 931. *Ariocarpus kotschoubeyanus* and *A. fissuratus* (p. 932) should be referred to a distinct genus, as follows:

ROSEOCACTUS Berger, Journ. Washington Acad. Sci. 15: 45. 1925.

Roseocactus kotschoubeyanus (Lemaire) Berger, Journ. Washington Acad. Sci. 15: 48. 1925. See page 931 for synonymy.

Roseocactus fissuratus (Engelm.) Berger, Journ. Washington Acad. Sci. 15: 46. 1925. See page 932 for synonymy.

Roseocactus lloydii (Rose) Berger, Journ. Washington Acad. Sci. 15: 48. 1925. *Ariocarpus lloydii* Rose, Contr. U. S. Nat. Herb. 13: 308. pl. 62. 1911. Considered by Berger a distinct species, known only from Zacatecas.

After *Ariocarpus retusus* add:

Ariocarpus trigonus (Weber) Schum. Gesamtb. Kakt. 606. 1898. *Anhalonium trigonum* Weber, Diet. Hort. Bois 90. 1893. Northern Mexico. Often confused with *A. retusus*, but characterized by its longer and narrower tubercles.

Page 932. After *Ariocarpus fissuratus* insert:

OBREGONIA Frič, Zivot v Prinode 29²: 3. 1925.

The genus resembles *Strombocactus* and *Ariocarpus*, but seems to be distinct from both.

Obregonia denegrii Frič, Zivot v Prinode 29²: 3. 1925. Vicinity of Victoria, Tamaulipas.

Page 949. After *Ferocactus rostrii* add:

Ferocactus johnstonianus Britt. & Rose, *Cactaceae* 4: 287. 1923. Type from Angel de la Guardia Island, Baja California.

Page 955. After *Cactus salvador* add:

Cactus oaxacensis Britt. & Rose, *Cactaceae* 4: 289. 1923. Oaxaca.

Page 961. After *Neolloydia conoidea* add:

Neolloydia stuetzlei (Frič) Britt. & Rose.

Coryphantha stuetzlei Frič, Zivot v Prinode 29: 65. 1925.

Solitary (rarely several heads from one root, or proliferous), oblong to clavate, 5 cm. in diameter, 14 cm. high, rounded at apex, densely long-lanate at top when in flower; tubercles dark green, short and thick, arranged in 8 or 9 spiral rows, the grooves on upper side of tubercles woolly but not glandular; areola at top of tubercle somewhat longer than broad, at first densely woolly; spines usually all radial, 18 to 24, white, often with black tips, spreading or recurved, 6 to 10 mm. long, a few areoles on old plants producing a central spine, this solitary, erect or ascending, 1 to 1.5 cm. long, black; flowers magenta, 3 cm. long or more; perianth segments oblong, acuminate; filaments short, pale; style and stigma lobes (5) white; fruit not seen.

Collected by C. R. Orcutt at La Maroma ranch, 10 miles north of Jaumave, Tamaulipas, Mexico, in 1925 (no. 554). Also collected at the same place and time by Robert Runyon (no. 31).

According to Mr. Runyon, the flowers open about 10 in the morning and close at 3 p. m. and open again on the following day.

Page 1009. After *Neomammillaria verhaertiana* add the following species:

Neomammillaria moelleriana (Bödeker) Britt. & Rose.

Mammillaria moelleriana Bödeker, Zeitschr. Sukkulent. 1: 213. 1924.

Solitary, 5 to 8 cm. in diameter; tubercles and plant body hidden under a mass of spines; tubercles not milky, somewhat flattened, almost imbricate, blue-green; spine areole circular, white-felted when young; radial spines acicular, about 40, glossy white, spreading, 3 to 5 mm. long; central spines much stouter than the radials, 8 or 9, one or more strongly hooked, 1.5 to 2.5 cm. long, dark brown; flowers 15 mm. long, light yellow; filaments and style white; stigma lobes 5 or 6; fruit clavate, pale green to white; seeds numerous, black, shining.

Known only from the type locality, Sierra de Santa María, Durango.

Neomammillaria eschaueri (Coulter) Britt. & Rose.

Cactus eschaueri Coulter, Contr. U. S. Nat. Herb. 3: 104. 1894.

Single or often cespitose, very small, 2 to 5 cm. in diameter, somewhat depressed; tubercles green, not milky; spines all pubescent; radial spines 20 or fewer, spreading, with dark tips, 12 mm. long or less; central spine solitary, reddish, 15 to 25 mm. long, hooked at the tip; flowers 15 mm. long; outer segments short, reddish green along the median vein; inner perianth segments oblong, acute, entire, greenish white; stamens included, greenish white; style white; stigma lobes 4, greenish white; fruit reddish, 10 mm. long; seeds reddish.

State of San Luis Potosí, where it has been collected recently by C. R. Orcutt (no. 22, 1925). Type from Zapatlillo.

The species was discovered near San Luis Potosí in crevices in limestone rocks by Doctors Francis and Luis Eschauer.

THYMELAEACEAE.

Page 1013. *Daphnopsis salicifolia*. "Ahuejote" (Veracruz).

After *Daphnopsis cestrifolia* insert:

Daphnopsis americana (Mill.) Johnston, Proc. Bost. Soc. Nat. Hist. 34: 242. 1909. *Laurus americana* Mill. Gard. Dict. ed. 8. *Laurus* no. 10. 1768. Type from Veracruz. The description given by Miller is too brief for identification. See Fawcett and Rendle, Journ. Bot. Brit. & For. 63: 51. 1925.

COMBRETACEAE.

Page 1031. *Combretum mexicanum*. Also in Nayarit, where it is called "cuaumecate."

Page 1032. *Combretum farinosum*. "Bejuco angarilla" (Sinaloa).

MYRTACEAE.

Page 1037. *Pimenta officinalis*. "Patololote" (Oaxaca). The aromatic leaves are employed for brewing a delicious tea (*Reko*).

Page 1043. *Eugenia oaxacana*. For this name substitute the following:

Eugenia purpusii Standl. *Eugenia oaxacana* Standl. Contr. U. S. Nat. Herb. 23: 1043. 1924. Not *E. oaxacana* Berg, 1860.

Page 1046. *Eugenia acapulcensis*. "Palo agrío" (Nayarit).

After *Eugenia acapulcensis* insert:

Eugenia oaxacana Berg, Linnaea 30: 683. 1860. Type from Oaxaca.

MELASTOMACEAE.

Page 1057. Before *Calyptrella* insert the following genus, accidentally omitted:

11. ADELOBOTRYS DC. Prodr. 3: 127. 1828.

1. *Adelobotrys adscendens* (Swartz) Triana, Journ. Bot. 5: 210. 1867.

Melastoma adscendens Swartz, Fl. Ind. Occ. 2: 772. 1800.

Southern Mexico. Jamaica; Central and South America.

Page 1064. *Miconia mexicana*. To the synonymy add: *Miconia purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 185. 1922.

ARALIACEAE.

Page 1083. *Gilibertia arborea*. "Mano de oso" (Sinaloa). To the synonymy add the following: *Gilibertia smithiana* I. M. Johnston, Contr. Gray Herb. n. ser. 70: 81. 1924; *Gilibertia eurycarpa* I. M. Johnston, Contr. Gray Herb. n. ser. 70: 82. 1924.

CLETHRACEAE.

Page 1089. *Clethra lanata*. "Jicarillo" (Nayarit).

ERICACEAE.

Page 1091. *Befaria mexicana*. "Madroño del agua" (Sinaloa).

MYRSINACEAE.

Page 1110. After *Icacorea compressa* insert:

Icacorea konzattii (Blake) Standl. *Ardisia konzattii* Blake, Contr. Gray Herb. n. ser. 53: 64. 1918. Type from Los Naranjos, Departamento de Miahuatlán, Oaxaca.

Page 1111. *Parathesis rekoii*. Probably not distinct from this is *Ardisia chiapensis* T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 413. 1924. Type from Hacienda Montserrate, Chiapas. Brandege's name has priority of publication, but it is invalidated in *Parathesis* by *Parathesis chiapensis* Fernald.

Page 1112. After *Parathesis lanceolata* insert:

Parathesis prionophylla Standl. Proc. Biol. Soc. Washington 37: 46. 1924. Type from Arroyo de Jalio, Nayarit.

SAPOTACEAE.

Page 1117. *Bumelia spiniflora*. "Jos" (Tamaulipas).

DIOSPYRACEAE.

Page 1125. *Maba verae-crucis*. A synonym is *Maba purpusii* T. S. Brandeg. Univ. Calif. Publ. Bot. 7: 329. 1920.

Page 1128. After *Diospyros sphaerantha* insert:

Diospyros californica (T. S. Brandeg.) I. M. Johnston, Proc. Calif. Acad. IV. 12: 1124. 1924. *Diospyros texana californica* T. S. Brandeg. Zoe 5: 164. 1903; see page 1127. A form with glabrate leaves is *D. californica tonsa* I. M. Johnston. loc. cit.

STYRACACEAE.

Page 1130. *Styrax argenteus*. "Lebadura" (Nayarit).

OLEACEAE.

Page 1141. After *Osmanthus* insert:

MAYEPEA Aubl. Pl. Guian. 81. 1775.

1. *Mayepea macrocarpa* Rusby, Bull. Torrey Club 38: 145. 1911.

Type from Mount Limón, near Balsas, Guerrero.

After examination of the type specimen, the writer is inclined to doubt that this plant belongs to the Oleaceae, but it has been impossible to make a satisfactory disposition of it in any other family.

LOGANIACEAE.

Page 1141. *Gelsemium sempervirens*. The entry should read: **Gelsemium sempervirens** (L.) Pers. Syn. Pl. 1: 267. 1805.

Page 1147. After *Buddleia parviflora* insert:

Buddleia purpusii Standl. Journ. Washington Acad. Sci. 16: 15. 1926. Near Monserrate, Chiapas.

APOCYNACEAE.

Page 1156. After *Stemmadenia mollis* insert:

Stemmadenia calycina T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 188. 1922. Type from Remudadero, Veracruz. Not seen by the writer.

ASCLEPIADACEAE.

Page 1193. After *Vincetoxicum xanthotrichum* insert:

Vincetoxicum edule (Hemsl.) Standl. *Gonolobus edulis* Hemsl. Biol. Centr. Amer. Bot. 2: 331. 1882. Oaxaca. Central America, the type from Guatemala. A woody vine with large 5-angled fruits which are cooked and eaten as a vegetable. "Gueto" (Oaxaca); "cuayote," "guayote" (Costa Rica).

CONVOLVULACEAE.

Page 1198. After *Jacquemontia smithii* insert:

Jacquemontia eastwoodiana I. M. Johnston, Proc. Calif. Acad. IV. 12: 1133. 1924. Baja California, the type from Ildefonso Island.

Jacquemontia mollissima Standl. Journ. Washington Acad. Sci. 16: 15. 1926. Monserrate, Chiapas.

Page 1201. *Calonyction muricatum*. "Nata," "maxh" (Chiapas, *Endlich*). The milky juice is said to be employed for coagulating rubber sap.

Calonyction aculeatum. "Hedrón" (Morelos).

Page 1202. *Exogonium bracteatum*. "Empanada" (Morelos); "bejuco blanco" (Sinaloa).

Page 1204. *Ipomoea crassicaulis*. "Hiedra" (Nayarit); "flor de la mañana" (Tamaulipas).

Page 1205. *Ipomoea intrapilosa*. Related to this is *Ipomoea pauciflora* Mart. & Gal. Bull. Acad. Brux. 12²: 266. 1845. From the description given by Martens and Galeotti it is not possible to determine definitely to which of the Mexican tree *Ipomoeas* the name belongs.

Page 1208. *Turbina corymbosa*. "Manto" (Veracruz).

POLEMONIACEAE.

Page 1210. *Loeselia tenuifolia*. The distribution should be changed to read as follows: Mountains of northern Baja California, the type from Cantillas Canyon.

BORAGINACEAE.

Page 1218. *Cordia alba*. "Baboso" (Tamaulipas).

Cordia alliodora. "Amapa hasta" (Sinaloa).

Page 1219. *Cordia beissieri*. Doctor Reko states that the words anacahuite and nacahuite are not derived from the Nahuatl *amacuahuitl* but from the root *nall*, signifying an edible fruit.

Page 1221. *Cordia sonora*. "Amapa bola" (Sinaloa).

Page 1224. After *Cordia cylindrostachya* insert:

Cordia ovata T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 187. 1922. Type from Remudadero, Veracruz.

MENTHACEAE.

Page 1269. After *Salvia coccinea* add:

Salvia chiapensis T. S. Brandeg. Univ. Calif. Publ. Bot. 10: 415. 1924. Type from Jalisco, Chiapas.

Page 1271. Before *Salzaria* insert the following genus, accidentally omitted:

5. SCUTELLARIA L. Sp. Pl. 598. 1753.

1. *Scutellaria suffrutescens* S. Wats. Proc. Amer. Acad. 25: 160. 1890.

Scutellaria spinescens Fernald, Proc. Amer. Acad. 45: 416. 1910.

Coahuila, the type from Sierra de la Silla, near Monterrey.

A small shrub.

Page 1276. *Hyptis emoryi*. A synonym is *Hyptis emoryi amplifolia* I. M. Johnston, Proc. Calif. Acad. IV, 12: 1149. 1924. Type from Escondido Bay, Baja California.

SOLANACEAE.

Page 1300. *Solanum amazonium*. "Mala mujer" (Sinaloa).

GESNERIACEAE.

After *Columnnea schiedeana* insert:

Columnnea purpusii Standl. Journ. Washington Acad. Sci. 16: 15. 1926. Mountains near Fenix, Chiapas.

Columnnea stenophylla Standl. Journ. Washington Acad. Sci. 16: 16. 1926. Chiapas (type from Finca Irlanda) and Oaxaca.

RUBIACEAE.

Page 1365. After *Calycophyllum* insert the following genus:

HILLIA Jacq. Enum. Pl. Carib. 3. 1760.

1. *Hillia chiapensis* Standl. Journ. Washington Acad. Sci. 16: 16. 1926.

Mountains near Fenix, Chiapas.

Page 1391. After *Psychotria oaxacana* insert:

Psychotria chlorobotrya Standl. Journ. Washington Acad. Sci. 16: 17. 1926. Fenix, Chiapas.

Psychotria phoeniciana Standl. Journ. Washington Acad. Sci. 16: 17. 1926. Mountains near Fenix, Chiapas.

ASTERACEAE.

Page 1419. *Aschenbornia heteropoda*. The type of this species is identical with *Calea zacatechichi* Schlecht.

Page 1512. *Gnaphalium rhodanthum*. The correct name of this species is *Gnaphalium salicifolium* (Bertol.) Schultz Bip. Bot. Zeit. 3: 172. 1845.

Helichrysum salicifolium Bertol. Nov. Comm. Acad. Sci. Bonon. 4: 433. 1840.)

Page 1541. *Tithonia scaberrima* Benth. This species is properly known as *Tithonia longeradiata* (Bertol.) Blake, Bull. Torrey Club 53: 217. 1926. (*Helianthus longeradiatus* Bertol. Nov. Comm. Acad. Sci. Bonon. 4: 436. 1840.)

INDEX

[Synonyms in *italic*]

The present index is complete for Part 5. It includes the generic and family names of the whole volume, but not the vernacular and specific names. The indexes for Parts 1 to 4 should, therefore, be bound with the complete volume.
